The Statute of Wills, allowing testators to dispose of their property by will, did not in terms permit the testator to devise real estate to a corporation. By judicial interpretation, however, the power was established to devise lands to corporations for charitable purposes.

From this period down almost to the present time statutes have been enacted modifying or further restraining the power of alienation to corporations, whenever judicial interpretation or the ingenious devices of lawyers made such enactments necessary.

The Statute of 9 Geo. II, c. 36 (1736), is noteworthy in that it shows that the policy on which the Statute of Mortmain had hitherto been based had then changed somewhat. This statute, reciting that "public mischief had greatly increased by many large and improvident dispositions made by languishing and dying persons to charitable uses, to take place after their deaths, to the disinheritance of their lawful heirs," enacted that in future no lands or sums of money to be laid out in land should be given to any person or body unless such gift or conveyance should be made or executed in presence of two witnesses 12 months before the death of the donor or grantor and be enrolled in the Court of Chancery within six months after the execution. Under this act, therefore a person on his deathbed cannot in England give land, or money to buy land, for a charitable purpose. It can only be done in the life of the donor at least 12 months before his death, and the property must be completely alienated so that he has no further control over it.

All the English statutes of mortmain were revised and consolidated by the Statute of 51 and 52 Vict., c. 42. In general this statute still restricts alienation to corporations, but it

makes numerous exceptions in favor of gifts to churches, public parks, museums, and for educational, literary, and scientific purposes. Gifts to charity by will are regulated by the Statute of 54 and 55 Vict., c. 73, which in general permits such gifts of land to charities if the land be sold within one year from the testator's death. Throughout the period of mortmain legislation it was possible for the crown to grant a mortmain license enabling a corporation to purchase and hold lands, a prerogative which at times was freely exercised and sometimes grossly abused.

Owing generally to the absence of great religious corporations in the United States and to the fact that the feudal system never obtained a foothold there, the mortmain acts were not reenacted, with possibly one or two exceptions. Pennsylvania has a mortmain act, and New York has a statute which, like the Statute of 9 Geo II, seems calculated rather to restrain a testator from making unwise and improvident gifts to charity than to prevent landholding by corporations. The statute provides that a testator who leaves surviving him a wife, child, or parent shall not devise or bequeath more than one-half of his estate to a charitable corporation, and no such devise or bequest shall be valid unless made more than two months before the death of the testator.

In many States business corporations may not receive real estate by devise, but generally charitable corporations may do so, and in most States there is no restraint upon conveyance of lands inter vivos to corporations, unless the charter of the corporation or the general law under which it is created limits the total amount of land which the corporation may hold. Consult Antony Highmore, *View of the History of Mortmain* (London, 1809), and J. Rawlinson, *Notes on the Mortmain Acts* (ib., 1877). See CHARITABLE TRUSTS, TRUST; USES; and consult the authorities there referred to, and also under REAL ESTATE.

MORTO DA FELTRE, mōr'tō dā fēl'trā (c 1474-c 1519). An Italian painter, born at Feltre. His fame rests upon Vasari's statement that he was the first to use classic arabesques in ornamentation. Of his life nothing certain is known, nor do any authenticated works by him survive. Cambruzzo, a seventeenth-century historian of Feltre, identified him with Pietro Luzzi (also called Zarato) of that town, who was an assistant of Giorgione at Venice. Luzzi is recorded as having been at Rome in 1495, at Florence in 1506, and at Venice in 1508. He is known to have decorated with frescoes the town hall, the church of San Stefano, and two houses in his native town. According to the usual account, Morto was killed fighting in the Venetian army at the battle of Zara, but if he be identical with Luzzi, he cannot have died till after 1519, in which year the latter was active in his native town.

MORTON, mōr'ton, CHARLES (1627-98). An English clergyman and educator, born at Pendavy, Cornwall, and educated at Wadham College, Oxford. He renounced the Royalist traditions of his family and became a Puritan, though he did not leave the Anglican communion until 1662. He opened what proved to be the leading school for English Dissenters at Stoke Newington, near London, which he maintained until 1685, having Daniel Defoe among his pupils, besides several others who became prom-

inent as dissenting ministers. Contrary to the custom of the universities, he made his pupils write their dissertations and hold their disputations in English—a practice which, Defoe affirms, made his pupils excel in English those of any other school. Tormented by proceedings against him in the ecclesiastical courts, Morton emigrated to New England in 1686. He settled first at Charlestown, Mass., and became the pastor of a church there. He became connected with Harvard College, and two of his manuscript works—*A System of Logic and Compendium Physica*—were used as textbooks. He was made the first vice president of the college and hoped to succeed Increase Mather as president. His death prevented the fulfillment of this ambition. Though a man of great ability, both in theology and mathematics, he shared in the prevalent superstition against witchcraft and encouraged those who brought about the prosecutions at Salem. Consult Josiah Quincy, *History of Harvard University* (Cambridge, Mass., 1840), and I. Parker, *Dissenting Academies in England* (Cambridge, 1914).

MORTON, GEORGE (c.1585-c 1628). An English colonist in America. He was born in England, joined the Puritans at an early age, and removed to Holland with his brother, Thomas Morton, settling at Leyden, where for some years prior to 1620 he was an agent of the London Puritans. In the latter year he sailed for New England in the ship *Ann*, in charge of a party of new Puritan settlers for the Plymouth Colony. He remained at Plymouth several years and then returned to England. The book known as *Mourt's Relation* (1622), which was the first published account of the New England settlement, comprising a journal of the first 12 months of the Plymouth Colony, has the name G. Mourt subscribed to the preface and for that reason has been ascribed to Morton. Careful investigators, however, among them Dr. H. M. Dexter, who reprinted the work with critical and historical notes in 1864, while agreeing that the name G. Mourt evidently referred to George Morton, are inclined to think that the account itself was the work of Bradford and Winslow.

MORTON, HENRY (1836-1902). An American scientist and educator. He was born in New York and was educated at the University of Pennsylvania. He first studied law, but afterward took up chemistry, and in 1863 became professor of chemistry in the Philadelphia Dental College. In 1869 he took the chair of chemistry in the University of Pennsylvania. In 1870 he became president of Stevens Institute of Technology, at Hoboken, N. J., towards the endowment of which he contributed over \$60,000. Morton took part in two eclipse expeditions, conducted important investigations in spectroscopy, and while a member of the Lighthouse Board (1878-85) carried out valuable experiments on electric lighting, fog signals, illuminating buoys, etc. His publications include numerous papers in scientific periodicals and the *Student's Practical Chemistry* (written jointly with Leeds and published in 1868).

MORTON, JAMES DOUGLAS, fourth EARL OF (1530-81). Regent of Scotland. The second son of Sir George Douglas of Pittendriech, in 1553 he succeeded in right of his wife, Elizabeth, daughter of the third Earl of Douglas, to the title and estates of the earldom. He early favored the cause of the Reformation, and in 1557 was one of the original Lords of the Con-

gregation. Sworn a Privy Councillor in 1561, he was appointed Lord High Chancellor of Scotland, Jan. 7, 1563. As one of the chief conspirators against Rizzio (q.v.), he fled with his associates to England, but obtained his pardon from the Queen. Though privy to the design for the murder of Darnley, on the marriage of the Queen to Bothwell he joined the confederacy of the nobles against her. After Mary's imprisonment in the castle of Lochleven he was restored to the office of High Chancellor, of which he had been deprived, and constituted Lord High Admiral of Scotland. On the death of the Earl of Mar, in October, 1572, he was elected Regent of the Kingdom. His rule, chiefly directed towards the benefit of the masses and towards the formation of a Protestant league with England, in anticipation of the union of the two kingdoms, made him obnoxious to many of the nobles, and as the young King, James VI, desired to assume the reins of government, Morton resigned the regency in March, 1578. Two months later, however, he obtained possession of the castle of Stirling, with the person of the King, and for a time recovered his authority. Intrigue, however, was active against him; he was accused of having participated in the murder of Darnley, and was beheaded at Edinburgh, June 2, 1581, bearing himself with dignity and composure and maintaining his innocence of "art and part" in the murder of the King's father. Consult Crawford, *Crown and State Officers of Scotland* (Edinburgh, 1726), and Andrew Lang, *History of Scotland* (ib., 1900-07).

MORTON, JAMES SAINT CLAIR (1829-64). An American soldier, a son of Samuel George Morton (q.v.). He was born in Philadelphia, graduated at West Point in 1851, and from 1855 to 1857 was assistant professor of engineering in that institution. In 1860 he conducted an exploration for a railway route across Central America for the government; in 1861 he joined the United States volunteers, was put in charge of the construction of the fortifications of Tortugas, and was promoted captain; in 1862 he became chief engineer of the Army of the Ohio, and later in the year was transferred to a like position in the Army of the Cumberland. In the same year he was promoted brigadier general of volunteers. He commanded a brigade at Stone River, was wounded at Chickamauga, and was made major of engineers in July, 1863. As chief engineer of the Ninth Army Corps he participated in Grant's Virginia campaign, and was killed while leading the assault on Petersburg. In recognition of his gallantry in this engagement Congress voted, after his death, that he be ranked as a brigadier general in the regular army. Previous to the war he published a number of works on fortification and engineering.

MORTON, JOHN (?1420-1500). Archbishop of Canterbury and Cardinal. He was born in Dorset and educated at Cerne Abbey, a Benedictine foundation, and at Balliol College, Oxford. Having studied law, he took orders and began to practice in the Court of Arches, the ecclesiastical tribunal of the Archbishop of Canterbury. Here he attracted the attention of Archbishop Bourchier, who presented him to Henry VI, and the latter gave him valuable ecclesiastical benefices. Though he had followed for a time the fortunes of the Lancastrians, Edward IV took him into favor, made him Master of the Rolls in 1473, and in 1479 Bishop of Ely. He was not in favor with Richard III, who arrested him and committed

him to the custody of the Duke of Buckingham, from whom he escaped and fled to the Earl of Richmond on the Continent. He is said to have suggested the union of the houses of York and Lancaster by the marriage of Richmond with the daughter of Edward IV. Henry VII on his accession made Morton a member of the Privy Council, and on the death of Cardinal Bourchier, in 1486, he was promoted to the see of Canterbury. In 1487 he was appointed Lord Chancellor, and in 1493 Pope Alexander VI made him Cardinal. Morton was the chief counselor of Henry VII, and hence has been held responsible, perhaps unjustly, for Henry's avarice (See **MORTON'S FORK**). He died Oct. 12, 1500. The history of Richard III which bears the name of Sir Thomas More was probably written in Latin by Morton. Near Ely he drained a part of the fens by Morton's Dyke. Consult Hook, *Lives of the Archbishops of Canterbury*, vol. v (London, 1867); James Gairdner, *Henry VII* (ib., 1889). id., *Lollardy and the Reformation in England* (2 vols. ib., 1908).

MORTON, JOHN (1724-77). One of the signers of the Declaration of Independence, born of Swedish ancestry, in Ridley Township, Chester Co., Pa. He was a surveyor for some years, but subsequently became a lawyer. He was for several years a member of the Pennsylvania Assembly, and in 1765 was chosen a delegate to the Stamp Act Congress. From 1766 to 1770 he was high sheriff of Chester County. During all this period he continued to serve in the Pennsylvania Assembly, and from 1772 to 1775 was Speaker of that body. He was an earnest champion of the rights of the Colonies in the pre-Revolutionary controversies, and was active in furthering the cause of the Revolution after the outbreak of hostilities. In 1774 he was elected a member of the Continental Congress, and remained a member of that body until his death, taking a leading part in the debates and helping to frame the Articles of Confederation.

MORTON, JOHN MADDISON (1811-91). An English writer of farces, best known as the author of *Box and Cox* (1847), which, thanks to its ingenious and laughter-provoking incidents, made a great hit in its day. He was born in Pangbourne, the son of Thomas Morton (c. 1764-1838), who was also a playwright—the author of *Columbus, or A World Discovered* (1792), *A Roland for an Oliver* (1819), etc. To pay his way through the world proved, despite his literary efforts, an insoluble problem for the younger Morton, and he died a pensioner at the Charterhouse. He was the author of plays enough to put him among the most prolific of dramatists. He had a knack for adapting French pieces, and was phenomenally fortunate in fitting the play to the player. Consult the list of plays given under "Morton" in the *Dictionary of National Biography*, vol. xxxix (London, 1894).

MORTON, JULIUS STERLING (1832-1902). An American journalist and politician, born at Adams, Jefferson Co., N. Y. He received his early education in the Methodist Episcopal Academy at Albion, Mich., to which State his parents had moved, and in 1850 he entered the University of Michigan. He completed his course at Union College, graduating in 1854, and in the year following settled in Nebraska, first at Bellevue and later at Nebraska City, where he founded and edited the *Nebraska City News*, the first newspaper to be established in the State. In 1856 and 1857 he was elected to the Nebraska

Territorial Legislature, and in 1858 was appointed by President Buchanan Secretary of the Territory, and upon the resignation of Gov. W. A. Richardson a few months later became acting Governor and local representative of the administration in the bitter struggle in the Territory. In 1866 he was the Democratic candidate for Governor, but was defeated. From that time until 1881, when he was again a candidate for Governor, he took no part in politics. In 1893 he entered the cabinet of President Cleveland as Secretary of Agriculture, remaining in office until 1897. Upon the advent of William Jennings Bryan into Nebraska politics he became one of his most active opponents and identified himself with the Cleveland gold wing of the Democratic party. In 1901 he was appointed by President McKinley one of the United States Commissioners for the Louisiana Purchase Exposition. He was a student of forestry, the originator of "Arbor Day," and president of numerous agricultural societies. At the time of his death he was editing a weekly paper entitled the *Conservative* in which he opposed most of the doctrines advocated in Bryan's *Commoner*. He wrote an *Illustrated History of Nebraska*, published in 1905.

MORTON, LEVI PARSONS (1824-). An American banker and political leader. He was born at Shoreham, Vt., and was educated at the academy in that town. In 1843 he established himself in a mercantile business in Hanover, N. H. In 1850 he removed to Boston, where he entered the banking business, and four years later he settled in New York City, where he was successful from the start. In 1863 he founded the banking house of Levi P. Morton & Co., later Morton, Bliss & Co., which became one of the most successful private banking firms in the country. A London branch, Morton, Rose & Co., was subsequently established. In 1878 Morton was elected to Congress as a Republican, and after being reelected in 1880, he was from 1881 until 1885 United States Minister to France, undertaking there negotiations concerning tariff rates and recognition of American corporations. In 1888 he was the successful candidate for Vice President on the Republican ticket. In 1895-96 he was Governor of New York, being most prominently associated, as such, with the abolition of the local-trustee system of school government. After retiring from public life, he continued his banking business and became interested in insurance companies. He made New York City his residence.

MORTON, MARCUS (1784-1864). An American lawyer and politician, born at Freetown, Mass. He graduated at Brown University in 1804 and at the Litchfield (Conn.) Law School, was admitted to the bar in 1807, and established himself in the practice of his profession at Taunton, Mass., where he remained for the rest of his life. From 1817 until 1821 he was a Democratic member of Congress. In 1823 he was a member of the Governor's Council, in 1824 was Lieutenant Governor, and in 1825 began a notable career as judge of the Supreme Court of Massachusetts. He remained on the bench until 1839, when he was the candidate of the Democratic party for Governor, and was elected by one vote over Edward Everett, the Whig nominee, although the Whigs carried the State electoral ticket. In 1840 he failed of reelection, but in 1842 was again elected. From 1845 to 1848 he was collector of the port of Boston. In the same year

he became a violent opponent of the Democratic policy as to slavery extension, and took a leading part in the organization of the Free Soil party, by which he was elected to the State Legislature for one term. Later he identified himself with the national Republican party and loyally supported the United States government during the Civil War.

MORTON, NATHANIEL (1613-85). An American Colonial historian, born of English blood in Leyden, Holland. He came to Plymouth, Mass., in 1623 and dwelt there till his death. On the death of his father he was taken into the family of Governor Bradford, whose wife was his maternal aunt, and early helped the Governor in public business. He was secretary of the court of the Colony from 1645 till his death. In 1669, at the request of the commissioners of the New England Colonies, he compiled and published at Cambridge, Mass., his *New England's Memorial, or a Brief Relation of the Most Remarkable and Memorable Passages of the Providence of God Manifested to the Planters of New England, etc.*, a work which was reprinted in England and several times in the Colonies and was the chief authority for the events of which it treated until the discovery in 1855 of Bradford's *History of Plymouth*, on which, together with the journals of Winslow, Morton, who had little originality, drew largely. Morton also wrote a *Synopsis of the Church History of Plymouth* (1680) and obituary poems of the style then in vogue.

MORTON, OLIVER PERRY (1823-77). An American political leader, best known as the War Governor of Indiana. He was born in Salisbury, Wayne Co., Ind., Aug. 4, 1823, attended the Wayne County Seminary, spent two years at Miami University, studied law, and in 1847 was admitted to practice. He soon became a prominent member of the Indiana bar, and in 1852 was elected circuit judge. He entered politics as a Democrat, but opposition to the Kansas-Nebraska Bill led him on May 2, 1854, to withdraw from the Democratic State Convention, and ultimately he assisted in the formation of the Republican party, to whose first national convention he was a delegate. In 1856 the People's party, as the Republican party in Indiana was at first called, nominated him for Governor, but after a close contest he was defeated. Four years later he was elected Lieutenant Governor, and, upon the Governor's election as United States Senator, Morton became Governor, Jan. 16, 1861. Upon the outbreak of the Civil War he threw himself with extraordinary energy and success into the work of raising troops. The election of 1862, however, resulted in the choice of a Democratic Legislature and Democratic State officers, who bitterly opposed the war and threw obstacles in his way. His task was still further complicated by the presence in the State of a large secret society called the Knights of the Golden Circle (q.v.), which resisted the draft, encouraged desertion, and even plotted the assassination of the Governor and the carrying of Indiana out of the Union. But Morton triumphed over all difficulties. He borrowed sufficient money on his own personal responsibility to meet the exigencies of the situation; put down the treasonable associations and brought the leaders to trial; and he secured the triumph of his party and his own reelection as Governor in 1864. In the opinion of such men as Chase and Stanton his services during this period were greater than those rendered by

any other of the great war governors. Shortly after the close of the war Morton was stricken with paralysis and was obliged to go to Europe. On his return to the United States he resumed his duties as Governor. In 1867 he was elected United States Senator and was reelected in 1873. In the Senate he became a recognized leader of the Republicans and, despite his poor health, accomplished a prodigious amount of work, serving on the committees on foreign relations, agriculture, military affairs, private land claims, and privileges and elections. At first an opponent of suffrage for the freedmen, he ultimately did much to promote the passage of the Fifteenth Amendment. He was one of President Grant's chief advisers, and sustained the administration in the unsuccessful attempt to carry through the Senate the proposed treaty for the annexation of Santo Domingo. In return for this last service the English mission was offered to him, but he refused it. In 1873, on the death of Chief Justice Chase, he declined also to become Chief Justice of the Supreme Court. At the Republican National Convention in 1876 he was a strong candidate for the presidential nomination and received 124 votes on the first ballot. He subsequently served on the Electoral Commission (q.v.). At this time his infirmities were such that he required assistance in moving about, and had to be carried from the lobby of the Senate chamber to his carriage. He died at Indianapolis, Nov. 1, 1877, as the result of an attack of paralysis. Morton possessed a powerful intellect, a determined will, and high executive ability, and was an orator of great popularity and force. An admirable biography has been written by W. D. Foulke (2 vols., Indianapolis, 1899).

MORTON, PAUL (1857-1911). An American financier and railroad and cabinet official, son of Julius S. Morton, born at Detroit, Mich. He was educated in the public schools of Nebraska City, was then employed as clerk by the Burlington and Missouri Railroad and later in the freight and transportation department of the Chicago, Burlington, and Quincy, where he was promoted eventually to be general freight agent. From 1890 to 1896 he was vice president of the Colorado Fuel and Iron Company and of the White Breast Fuel Company. In 1896 he was made third vice president of the Atchison, Topeka, and Santa Fe Railroad, and in 1898 second vice president, with charge of the freight traffic. During his eight years' incumbency he became widely known for his ability in handling transportation problems. In politics he was a staunch Democrat until 1896, when he became a Republican on the silver issue. In 1903 Morton became prominent because of his fearless testimony regarding railroad rebates, which were then under general investigation by the Federal authorities. His conduct received the attention and approval of President Roosevelt, who in 1904 appointed him Secretary of the Navy; in this capacity he served for a year. He was invited, after the Armstrong Committee investigation in 1906, to become president of the Equitable Life Assurance Society. He reorganized this company and brought about meetings of the executive officers of other organizations to provide uniform rates and tariffs. See **HYDE, HENRY BALDWIN**; **HYDE, JAMES HAZEN**; **LIFE INSURANCE**.

MORTON, SAMUEL GEORGE (1799-1851) An American physician and natural scientist, born in Philadelphia. He studied medicine under Dr. Joseph Parrish and was assisted by Dr.

Richard Harlan, the natural historian, from whom he gained a strong taste for general science. He graduated M.D. from the University of Pennsylvania in 1820, and after three years of European study received a degree from Edinburgh University. Beginning practice in Philadelphia in 1824, he soon attained a prominent position. In 1830 he was appointed professor of anatomy in the University of Pennsylvania, which chair he continued to fill until 1843. While abroad Morton studied the geology of Scotland, and on his return presented to the Academy of Science a collection of the greenstone rocks of that country. In 1827 he published an *Analysis of Tubular Spar from Bucks County*, in 1828 *Geological Observations*, and in 1834 *Synopsis of the Organic Remains of the Cretaceous Group of the United States*. He was besides an ethnologist of wide note, the author of *An Inquiry into the Distinctive Characteristics of the Aboriginal Race of America* (1840, 2d ed., 1844) and of *Some Observations on the Ethnography and Archaeology of the American Aborigines* (1846). The owner of a very large collection of skulls from all races of the world (now in the museum of the Philadelphia Academy of Natural Sciences), Morton wrote: *Crania Americana* (1839), *Catalogue of Skulls of Man, etc.* (1840, 3d ed., 1849), *Crania Egyptica* (4 vols., 1844); etc. His medical works include: *De Corporis Dolore* (1823), *Illustrations of Pulmonary Consumption* (1834), an American edition of Mackintosh's *Principles of Pathology and Practice of Physio* (1836, 4th ed., 1844), *An Illustrated System of Human Anatomy* (1849). In still another field were his *Hybridity in Animals and Plants* (1847) and *Additional Observation on Hybridity* (1851). Consult C. D. Meigs, *A Memoir of Samuel George Morton* (Philadelphia, 1851).

MORTON, THOMAS. See **MORTON, JOHN MADISON**.

MORTON, THOMAS (1604-1659). An English prelate and controversialist, born in York and educated at St. John's College, Cambridge. He was ordained a priest in 1594 and became chaplain to Lord Huntingdon. Upon the death of Elizabeth he became chaplain to the Earl of Rutland. In his first work, *Apologia Catholica* (1605), he defended the Church of England and attacked the Jesuits, which he continued to do throughout his life. A royal chaplain, he was also successively Bishop of Chester (1615-18), of Lichfield and Coventry (1618-32), and of Durham (1632-59). Morton was one of the outstanding figures of the Church of England at a time when firmness and moderation in her bishops were needed to win Puritans and Catholics to her fold and to loyalty to the crown. His opposition to Catholic doctrine was unyielding, although while Bishop of Chester he appeased the Catholic laity by allowing them Sunday amusements. As a controversialist he was thought worthy to enter the lists with Cardinal Bellarmine (q.v.). Towards Protestant nonconformists he was more liberal. He had no sympathy with Archbishop Laud (q.v.) and was even willing to meet the Presbyterians half way by admitting that ordination by presbyters was valid in cases of necessity. When the Parliament was victorious against Charles I, Morton had to meet his share of the popular odium against the Established church. In 1641 he was mobbed by the people and was one of the 12 bishops impeached, though on slight grounds,

by the Parliament for high treason. Morton suffered four months' imprisonment and never resumed his seat in the House of Lords. The last years of his life were spent in the household of an old friend, Sir Christopher Yelverton. His works include: *A Treatise of the Threefolde State of Man* (1596); *An Exact Discoverie of Romish Doctrine* (1605); *A Defence of the Innocency of the Threc Ceremonies of the Church of England* (1609); *A Catholic Appeal for Protestants* (1610); *The Grand Imposture of the Church of Rome* (1628); *The Necessity of Christian Subjection* (1643); *Ezekiel's Wheels. A Treatise Concerning Divine Providence* (1653); *A Treatise of the Nature of God* (1669).

MORTON, THOMAS (c.1590-1646). An English adventurer, by profession an attorney. He visited New England with Weston's expedition in 1622, and in 1625 he returned with Captain Wollaston's colony, which settled at Mount Wollaston, within the present limits of Quincy, Mass. After Wollaston's departure to Virginia the next year, Morton ousted Fitcher, who had been left in charge, and changed the name of the settlement to Ma-re-Mount or Merry-Mount. He began to trade with the Indians, and the settlement became the rendezvous for the reckless and dissolute. In 1627 he erected a Maypole 80 feet high, and the revels lasted for days. When this and the fact that he was supplying the Indians with firearms in defiance of King James's proclamation of 1622 became known at Plymouth, a remonstrance was sent to him. In 1628 he was captured by Capt. Miles Standish and sent back to England with charges. There he ingratiated himself with Sir Ferdinando Gorges. Meanwhile Endecott visited Merry-Mount, cut down the Maypole, and renamed the place Mount Dagon. In 1629 Morton returned to Plymouth and to Merry-Mount. In 1630 he was again arrested after several unsuccessful attempts, and was placed in the stocks, while his house was burned and his property seized, on a charge of disorderly conduct and oppression of the Indians. When sent to England he again joined the Gorges claimants and furnished much information against the Massachusetts Colony. When the New England Council surrendered its charter in 1635 and divided the territory, Morton was appointed solicitor to press the confirmation of the deeds and the revocation of the Massachusetts charter. Only want of money prevented the destruction of the Colony. In 1637 he published the *New English Canaan*, which had probably been written in 1634-35. The first part is an account of the Indians, the second a description of the country, and the third a confused, somewhat humorous account of the "precise separatists" of Plymouth and Massachusetts Bay. In 1643 he again appeared in Plymouth and remained through the winter. He then appeared in Maine and Rhode Island. In 1644 he was captured by the Massachusetts authorities, kept in prison a year, and fined £100 on charge of having made a complaint of the Colonies to the council. He was released without payment of the fine, and died in Maine. Morton's life and his settlement at Merry-Mount form the subject of John Lothrop Motley's novels, *Morton's Hope* (1839) and *Merry-Mount* (1849), and one of Hawthorne's short stories is entitled *The Maypole of Merry-Mount*. Motley's book has been reprinted with an elaborate memoir and full notes by C. F. Adams, in the "Prince Society Publications," vol ix (Boston,

1883). Consult C. F. Adams, *Three Episodes of Massachusetts History* (2 vols., Boston, 1893).

MORTON, THOMAS GEORGE (1835-1903). An American surgeon. He was born in Philadelphia, graduated M.D. from the University of Pennsylvania in 1856, and practiced in his native city. During the Civil War he was actively engaged in the establishment of hospitals and as consulting military surgeon in Philadelphia. After the war he paid special attention to orthopedics. He was the first to describe metatarsalgia (Morton's disease) in 1876—*A Peculiar and Painful Affection of the Fourth Metatarsophalangeal Articulation*. Among his writings are "Transfusion of Blood, etc.," in Seguin's *Series of American Clinical Lectures* (1877) and, with W. M. Hunt and others, *Surgery in Pennsylvania Hospital* (1880).

MORTON, WILLIAM JAMES (1845-). An American physician, son of William T. G. Morton. He was born in Boston and graduated at Harvard in 1867 and at Harvard Medical School in 1872, taking the Boylston prize for his thesis on Anæsthetics. From 1873 to 1874 he studied at Vienna, going from there to Kimberley in South Africa, where he built up a practice and engaged in diamond mining. After two more years of European study he settled in New York. Here he was for a time editor of the *Journal of Nervous and Mental Diseases*, was adjunct professor of nervous diseases at the New York Postgraduate Medical School from 1882 to 1885. In 1890 he became professor of nervous diseases and electrotherapeutics at the New York Postgraduate Medical School. His name is connected with advances in electrotherapeutics. In January, 1913, with Julian Hawthorne (q.v.), he was convicted of fraudulent use of the mails in promoting worthless Canadian mines, and was sentenced to serve in Atlanta Penitentiary, his term to expire a year and a day from the beginning of the trial (Nov. 25, 1912). Released in October, he was later pardoned by President Wilson, had his civil rights restored, and was readmitted to practice.

MORTON, WILLIAM THOMAS GREEN (1819-68). An American dentist, probably the first to recognize the general anæsthetic properties of sulphuric ether. He was born at Charlton, Mass. In 1840 he took up the study of dentistry at the Baltimore College of Dental Surgery, then recently established by the new Society of American Dental Surgeons. On his return to Boston in 1842 to practice Morton's attention was drawn towards medicine, and in 1844 he began study with Dr. Charles T. Jackson, of Boston, and continued in Harvard Medical School. He did not complete his course, but was afterward awarded an honorary M.D. by the present College of Physicians and Surgeons, Baltimore. The art of dentistry was at that time in a transition stage, and Morton's inventive genius devised many improvements, especially a new solder by which teeth could be attached to gold plates. In Dr. Jackson's laboratory Morton became acquainted with the value of sulphuric ether as a local anæsthetic and used it first in dental operations. After a series of experiments on animals, he finally succeeded in proving the efficacy of vaporized ether as an anæsthetic during the extraction of teeth. Previously anodynes had been used—alcoholic stimulants, laudanum, and the galvanic current. Making known his results to Dr. John C. War-

ren, he administered ether at the latter's request in the Massachusetts General Hospital on Oct. 16, 1846, the operation being that of removing a tumor from the jaw. At the suggestion of Dr. Oliver Wendell Holmes the new form of narcosis was called anæsthesia, and Dr. Henry J. Bigelow reported the discovery in the *Boston Medical and Surgical Journal* on Nov. 18, 1846. Dr. Morton obtained a patent for the use of ether, under the name of letheon, in 1846, a month after the operation in the hospital, and a month after this another patent, in England. Dr. Jackson also claimed the honor of having made the discovery. The French Academy awarded 2500 francs each to Jackson and Morton, but the latter declined to accept his share. However, in 1852, he received the Montyon prize in medicine and surgery. Congress offered him \$100,000 for his patent, but he refused to sell it, and became involved in many suits with the government and individuals. In fact the rest of his short life was spent in futile contests, literary and legal, in regard to his patent. He was the father of William J. Morton (q.v.)

MORTON'S DISEASE. See METATARSALGIA.

MORTON'S FORK. A famous dilemma said to have been proposed by the chancellor of Henry VII of England, John Morton (q.v.). In 1491 Henry resorted to the unconstitutional method of obtaining money by a benevolence (q.v.), and Morton in carrying out the scheme is supposed to have told those who lived well that their opulence was proved by their large expenditure, while those who spent little were told they must have saved considerable by their economy. Either class could well afford to assist the sovereign.

MORTUARY CUSTOMS. Observances connected with death and burial. The care of the dying and of the dead is a marked feature of religion among all peoples, from the lowest to the highest, and is associated most closely with spirit belief and custom. It is possible to treat the subject ethnically, enumerating and classifying peoples by their mortuary customs, or culturally, studying the genesis and development of each class of actions and beliefs involved. The latter method is here adopted. Mortuary customs, for the convenience of study, may be considered under the following heads, which by their characteristics as well as by their presence or absence are worthy of note

1. Customs concerning the dying.
2. Treatment of the corpse, including the posture of the body, bathing, cutting, decapitating, embalming, or cremating the corpse, or scraping the bones
3. Clothing or wrappings of the corpse.
4. Incasement of the corpse in the crate, basket, jar, box, or other receptacle which may answer to the coffin. In this, protection and convenience of carrying are the ends desired.
5. Watching the corpse, including the wake and funeral feast
6. Bearing the corpse to the place intended for it, the funeral, with all its apparatus, processions, and rites.
7. Disposal of the corpse
8. Post-mortem ceremonies, passing under the general term "mourning."
9. Cult of and for the dead, beliefs about the dead, the ghost, necromancy.
10. Memorials for the dead, mementos preserved or worn, and monuments of every kind.
11. Ascriptions to the dead, epitaphs, mortuary sayings, and literature

Customs Concerning the Dying. In the belief of many of the lower races death from natural causes is a thing unknown; it is always the act of some god or personage, designed and chiefly malevolent. Every disease and every death among the Polynesians is held to be caused by the gods for some crime against taboo or as the result of some offering by an enemy. Hence the neglect and cruel treatment of the sick. Even death caused by poison is thought to be due to the displeasure of the gods.

Care for the dying can scarcely be said to exist among savages, although the most strenuous efforts of the magician and friends are put forth to exorcise the destroying spirit and thus to restore the patient. The moment hope has departed, the preparations for burial are begun almost before the breath has left the body. So strong is the belief in the necessary connection between magic and death among the Australians that when a man believes he has been "pointed at" or run through with a magic spear that has been "sung" he is likely to die. Well-authenticated cases are on record in which the slightest ailment or wound has resulted fatally because the victim was convinced that the instrument had been charmed by magic. For many forms of conjuring there is no remedy. In others a cure is possible by the aid of a magician belonging to the totem of the person who "pointed" at the sick man. The practices of the medicine men are almost universally the same. They make the same passes, suck the wound, and mutter incantations, and the imagination of the patient often effects a cure.

Treatment of the Corpse. No sooner has life become extinct than the preparation of the body begins. For economy's sake most primitive tribes double the corpse into the smallest compass, the chin resting on the knees. Even among such an advanced people as the ancient Peruvians this custom of packing the body into the smallest compass prevailed, a strong rope being used to draw the limbs into place and bind them fast. It has been said that the motive in this is to imitate the posture of the unborn infant, but aside from the fact that crouching is a common position in life among savages, economy of space in the grave or tomb has much to do with the custom.

Embalming the dead was at first only a natural process. There are regions where the arid climate desiccates all flesh, as on the western plains of the United States and in Peru, Egypt, and Arabia. The drying up of the body suggested to the primitive mind religious ceremonies which found their culmination in the all-absorbing mortuary cult of Egypt. The Polynesians when first discovered had an elaborate ceremony of embalming their dead priests. The brains and intestines were removed, and all moisture was carefully wiped from the body, which was anointed with fragrant oils and dried in the sun. It was then clothed and seated in a little house erected for the purpose, where a table was set before it for food, fruits, and flowers. Here also belong such ceremonies as calling the dead, anointing, closing the eyes and lips, bathing, kissing, placing coin in the mouth, all of which have symbolical meanings with reference to the future well-being of the dead, as well as to the immediate relations of the ghost with the living.

Clothing or Wrappings of the Corpse. Scarcely any people consigns its dead to the last resting place naked. The corpse is clad either

with the clothing worn in life, or the best attire, or special grave cloths, shrouds, or winding sheets. Furthermore, masks are frequently placed over the whole body or over the face. Among the very lowest peoples the corpse may be put away naked, but this takes place only among those tribes that wear no clothing. The preparation of a special shroud has its prototype even among very primitive races, and begins with the chiefs or leading men, who in life wear an official or professional dress. The order of the development of ceremonies seems to have been: first, the disposal of the body naked; second, dressing the corpse as in life in order to take up the new life in the spirit world at once; third, arraying it in its best clothing, to make a good impression on the ghosts among whom it goes; fourth, wrapping it in a shroud for sentimental reasons. Among the Egyptians the corpse was wrapped with narrow strips of linen. In Turkestan a similar practice is now in vogue, in Kimbondo leather is used, and in Mashonaland the toes and fingers are tied up each in a separate piece of cloth.

Incasement of the Corpse. The receptacles for the dead body are of many sorts. Among the ancient Aleuts the corpse was doubled up and fully clothed. It was then crated, hung on the wall of a cave, or set in a safe place on the floor. The Eskimo employ tough walrus hide as a case for the dead. The Pacific coast tribes, wherever the giant cedar grows, make boxes or hollow logs for the corpse. The plains Indians crated the bodies of the dead and all their belongings before placing them on the platforms, and the old cave people of Utah packed them in burden baskets.

The southern Indians made hurdles of cane and rolled them about the corpse. Farther south no coffin was needed, for the bodies were exposed in *quibogoms*, or dead houses, until the flesh was gone, after which the bones were buried in the earth or in jars. Some of the ancient mound builders made a stone box or coffin in the grave for the bones.

A common motive among primitive tribes in using the coffin was to hold the bones together for burial. Custom demanded it and the ever-watchful and jealous ghost required it. Again, the coffin or its substitute guarded the corpse from ravenous beasts and birds of prey, and it may also be possible that among some tribes the dead are boxed up to prevent them from escaping or being spirited away by unfriendly ghosts. In many tribes the habitation motive prevails; the coffin or tomb is regarded as the house of the dead.

Watching the Corpse. Between death and burial the spirit or the double of the dead hovers around the body and expects the most rigid adherence to custom. This belief is the origin of the widespread custom of lykewake, or watching the corpse. Among many primitive tribes the dead are not hurried to burial, but the ceremonies of mourning begin around the corpse. The Polynesians placed the body of the dead on a bierlike frame covered with white tapa, which was decorated with flowers, or upon a bed of fragrant leaves. Relatives sat around lamenting and cutting themselves with sharks' teeth. Vigils about the dead are widespread among the white races. The folklore of the civilized world abounds in customs during the day or two that intervene between death and burial. The watch feast, or wake, has dwindled to a company of a

few friends. Salt is placed on the breast of the dead, a candle burns night and day at the head of the coffin. The sin eater takes bread and publicly devours it for the misdeeds of the deceased.

Removing the Corpse to the Place Intended for it. The funeral proper is one of the most solemn of rites the world over. Among many tribes the corpse must be taken out of the dwelling through the roof or by some roundabout way, in order that the ghost may get bewildered and not return. The procession to the grave, among savages, has changed little in the course of centuries. Usually, mutilations of a more or less cruel character are then observed by certain persons, while among other tribes only a small number carry the dead away and are thereafter unclean.

Disposal of the Corpse. The disposal of the corpse does not necessarily mean interment. We may distinguish five methods which have undergone countless modifications as outgrowths of race, climate, soil, and grade of culture. 1 *Exposure*—The bodies are not sealed up, but are left to destruction on the ground (rare), or are hidden in clefts, caves, or grottoes; in the hut where the death took place; on trees, posts, scaffolds, or platforms; in boxes or canoes; in log pens, or dead houses; or in towers of silence. 2 *Aquatic Burial*—The corpse is placed on the water or under the water, as among the Hindus, who consign dead bodies to the Ganges. 3 *Inhumation*—The corpse is buried in a single grave, which is often shelved or recessed, in pits or golgothas, in cairns, or under mounds or tumuli; under the floor of the home or in consecrated structures. 4 *Encystment*—The body is inclosed in rude boxes of wood, stone, or other materials, which are placed in dolmens, vaults, sepulchres, house tombs, cistvaens, or mausoleums. 5 *Cremation*—The corpse is burned and the ashes are abandoned, scattered, buried, boxed, or inurned.

In this connection belongs the custom of making deposits with the dead. No other part of this complicated series of customs comes so near to the world of shades. Thus, in Dahomey the bodies of wives and slaves were sacrificed without number, and in the days of knighthood the horse and armor accompanied the warrior. It is through these relics found with the dead that archaeology is to a large extent possible. Most extinct peoples were without the art of writing, but stone implements, pottery, objects in bone and metal, and even textile fabrics reveal enough to enable the archaeologist to reconstruct ancient society. Among some American tribes articles of use were punctured or broken before being placed in the grave. One of the tribe who robbed a grave would not be tolerated, but an mimical tribe might be tempted. The Polynesians would rob sacred enclosures of the enemies' dead in time of war and steal the bones of distinguished men to make tools, fish hooks, and other degrading implements. To avoid this, bones were carried to the caverns far away and hidden in clefts of rocks. In the Fiji Islands favorite wives as well as slaves were strangled on the death of a chief in order that they might wait upon him and be happy with him in the spirit world. To this they gladly submitted, not only in the prospect of greater happiness, but to avoid unspeakable miseries in after life. See BURIAL; CREMATION OF THE DEAD.

Post-Mortem Ceremonies. These may be

grouped together under the general head of mourning, including both what is done and what is left undone in dress, conduct, etiquette, and rites. As soon as a burial takes place among the Australians and other savage races the camp is burned down, everything in it is destroyed, and the people move to another place. During the mourning period no person may mention the name of the dead except in case of necessity, when it must be done in a whisper for fear of annoying the ghost. If the ghost should hear the name mentioned it would come to the conclusion that the relatives were not properly mourning, and they would be in consequence liable to his vengeance, for, if their grief were genuine, it would cause them too much pain to hear his name mentioned to allow them to speak it.

Many seemingly absurd customs about the graves or tombs of the dead are easily explained when it is kept in mind that the dead are not regarded as really dead. Putting rags or parts of torn clothing about the tombs, or on trees near by, as a notice to the ghost that the appropriate rendering of garments had taken place, is one of these customs. A complete list of them would fill a volume. It is enough to mention the tolling of bells, choice and fashions of mourning, cutting one's flesh, calling the dead, turning pictures towards the wall, feeding the dead, scrupulous care of the grave, hired mourners, and the imperative customs as to who shall mourn, when, how long, and how, sacrifices at the grave, naming the dead, and the widow's lot.

Cult of and for the Dead. The ghostly world of savages is never far away. The anthropomorphism of nature does not end with this life. The dead go at once to some place on the earth or under the earth where the most congenial occupations are renewed. When the ghost of the Polynesian leaves the body it is drawn out through the head as the sword is pulled out from the scabbard. Evil powers also lie in wait for the ghost to seize it when it is drawn out. Arriving safely at the place of the blessed, it is devoured by the gods, cannibalism being in full vogue above.

Not in savagery only, but in all races, ages, and grades of culture, this belief in the nearness of lost ones is held. More than this, reincarnation and metempsychosis are believed to be possible. The savage woman complacently murders her babe, thinking that the same one will enter into the mother's womb and be born again. As the dead are not considered dead, but are even more powerful as ghosts than they were as men, a complex and wide-reaching cult of almost universal extent has been evolved, which has for its object the propitiation and gratification of the spirits of the dead. See DEMONOLOGY; GHOSTS.

Memorials for the Dead. Combined with the fear of the dead is a desire, primarily, perhaps, based on anxiety to propitiate the ghost by a proof of suitable mourning and later founded on real affection, to preserve the memory of the departed. The Andamanese widow carefully dries the skull of her deceased husband, paints it with ochre, decorates it with rude lacework, and wears it for a memorial about the neck. Analogous synecdochic preservation of the dead is almost universal among primitive peoples. The Eskimo place by the side of the grave the huge jaw of a whale. The northern Pacific tribes set up great posts of cedar. The ancient people of the Mississippi valley built mounds of earth and stone. In Easter Island images cut in lava

were memorials. The Tahitians set up little models of their houses about 6 feet high, where the body of a chief clothed and rubbed with aromatic substances was laid while offerings were made. These all tell the same story. As culture advanced monuments (see MONUMENT) became more elaborate, and the modern cemetery differs from the primitive memorials in degree rather than in kind.

Ascriptions to the Dead. The custom of eulogizing the dead is extremely primitive and ancient. The Polynesians had professional bards who composed elegies which were committed to memory and preserved. These were recited on special occasions when the dead were mentioned. The American Indians had a solemn style of speech for such occasions quite above the grasp of the ordinary man, while the great epics of Greece and Rome abound in passages over the dead of deepest pathos. Here, too, belongs the entire body of epitaphs, or memorial inscriptions placed on tombs in honor of the dead who are laid in them. See EPIGRAPH.

A summary of the ethnographic data has been begun by Frazer in *The Belief in Immortality, and the Worship of the Dead*, of which vol. i (New York, 1913) deals with Australia, the Torres Straits, New Guinea, and Melanesia. For North America, consult Yarrow, "Mortuary Customs of the North American Indians," in *Bureau of American Ethnology, First Annual Report* (Washington, 1881).

MORÜNGEN, HEINRICH VON. See HEINRICH VON MORÜNGEN.

MORVEAU, LOUIS BERNARD GUYTON DE. See GUYTON DE MORVEAU, L. B., BARON.

MORVI, mōr-vē'. A native Gujarat state of Bombay, India, on the north side of the Kathiawar Peninsula. Area, 822 square miles (Map India, B 4). Two-fifths of the land is under cultivation, producing grain, sugar cane, and cotton. Salt and cotton textiles are manufactured. The chief port is on the Gulf of Cutch. Pop., 1911, 14,962. Capital, Morvi.

MORYSON, mōr'i-sōn, FYNES (1566-1630). An English traveler, remembered for the partial account of his travels—he sojourned in Ireland, Scotland, several countries of Europe, and in the Holy Land—entitled *An Itinerary* (1617), planned to be in five parts, only three of which were originally printed, the fourth part being preserved in manuscript in the library of Corpus Christi College, Oxford, and a portion of it getting into print in Charles Hughes's *Shakespeare's Europe* (1903). The value of the work to social historians led to the reprinting of other portions of the *Itinerary*—in *History of Ireland 1599-1603* (1735) and in the *Carisbrooke Library* volume (edited by Henry Morley), *Ireland under Elizabeth and James I, Described by Spenser, Sir John Davies, and Fynes Moryson* (1890).

MOSAIC, mō-zā'ik (ML. *mosaicus*, Gk. *μουσαϊος*, *mousaios*, mosaic, artistic, relating to the Muses, from *μοῦσα*, *mousa*, Muse). A branch of fine art which was especially prominent during the Middle Ages, though not unknown to antiquity, and is still practiced to a limited extent. Mosaic work, when it attained full growth, had various branches. It was used: (1) on floors; (2) on walls. (3) on detached objects, monuments or furniture. It consisted of the grouping of pieces of marble, glass, or enamel so as to form ornamental or figured compositions. In the *opus sectile* the thin marble plates

were cut so as to follow the outlines of the design, and it is not properly a branch of mosaic. *Opus tessellatum* is the technical term usually applied to mosaic of small cubes (tessellæ) of marble or stone in simple patterns, usually used for pavements. For wall compositions, architectural details, and furniture, though marbles were at first used almost exclusively, the possibility of producing a greater variety of shades in artificial enamels led to their exclusive use on walls as early as the fifth century and in furniture after the eleventh century. The term *opus musivum* is usually applied to such work on wall and ceiling. The cubes used for figures were usually smaller than those used for decorative work. Some are as small as 3 millimeters, more than 100,000 being contained in a square meter. Gilt cubes were made by inclosing the gold leaf between two pieces of white glass. The cubes were colored with metallic oxides. Colored glass was first cut into long narrow sticks and these again broken into the cubes, which were sorted into their separate cases, according to colors and shades, like printers' type. To execute a wall composition the mosaicist prepared his cartoons, the mason plastered as large a section of the wall as could be covered in a day, the mosaicist stenciled or dotted his cartoon on the wet plaster and then rapidly fastened to it the mosaic cubes. The surfaces were flattened, washed, and burnished. In the best work the cubes are not absolutely even or adjacent, so that mechanical effects are avoided.

Early History. Both the Egyptians and Assyrians used mosaic in jewelry and furniture, particularly on ivory grounds. Mosaic designs were used by the Egyptians and also by the Greeks to embellish columns, tiles, and various architectural members. The earliest survivals of Greek mosaics at Delos and Olympia date from the Roman period. They came into prominence for the reproductions in permanent form of famous paintings on the floors of public and private buildings, a practice which the Romans learned from the Greeks. We even hear that scenes from the Trojan War were represented on floors of the great ship of Hiero of Syracuse. A famous floor at Pompeii represents in a grand composition a scene of Alexander's victory at Issus, full of action and variety. Even larger and more complicated is the Nile scene of a floor found at Palestina, with its inundated city, its fishing and other genre scenes.

Roman. Although the Romans were not ignorant of the use of glass cubes on walls, they never developed this branch of mosaic work; the fountains and niches at Pompeii and Ostia are almost the only surviving examples. But in their pavements they showed the greatest variety, from the simple crude geometric designs in black and white to the exquisite gradations of color and form in such works as the Capitoline doves, the landscapes from Hadrian's villa in Rome and Berlin, the Pompeian actors by Dioscorides in Naples, the portraits of poets and philosophers at Cologne, and many more. Midway between stand such colossal works as the gladiator pavement of the Baths of Caracalla. Roman mosaic pavements of artistic value have been found not only throughout Italy, but in France, Spain, Germany, Hungary, north Africa, Syria, and Asia Minor.

Early Christian. In the fourth century Christian artists perceived the value for church interiors of the rich coloring and permanency of

mosaic. No form of painting harmonizes so well with architecture. Mosaics were placed nearly always in the apses and on the triumphal arches of the early Christian basilicas, and in important cases upon the walls of the nave, and sometimes both on the inside and outside walls of the façades. The interiors of mausoleums and baptisteries were covered with them on dome, walls, and apse. While the upper part of the walls was decorated in this way with figured mosaic composition, the geometric mosaics or *opus sectile* were used on the dadoes below, and the marble geometric mosaics covered the floors. In the later Middle Ages the twisted columns, sepulchral monuments, altar canopies, pulpits, choir screens, and other details were entirely inlaid in geometric designs, in the East and in Italy. The wealth of works is concentrated in Italy and in the purely Hellenic world. Rome and Ravenna had special schools with offshoots at Naples, Milan, Grado, and Parenzo. Constantinople and Thessalonica, also, were independent centres, radiating over Greek lands.

Rome preserves the earliest Christian works at Santa Costanza, similar to catacomb frescoes, and at Santa Pudenziana the counterpart of the Christian sarcophagi with Christ and the Apostles. The earliest series where mosaic painting attempts a great scheme of subjects taken from the Old and New Testaments is in Santa Maria Maggiore in Rome, on apse, triumphal arch, and nave. The mosaics over the chancel arch of St Paul's, representing subjects from the Apocalypse, date from the fifth century. In both cases the composition is still confused; the art has not yet found itself. It was from Greek artists that the solution came, in the introduction of the uniform gold background, against which the figures stood out clearly, as compared with the old white ground. At Ravenna we see this style in its earliest glory in the two baptisteries (fifth century), and especially in the mausoleum of Galla Placidia (440) and later in the church of Sant' Apollinare Nuovo (c.500-550). The latter monument has its entire main walls covered with a triple row of mosaics. Thoroughly Greek also is the culminating work of the sixth century, the decoration of San Vitale, also at Ravenna, with its two great historic panels of Justinian and Theodora, the Byzantine court and the ecclesiastical grandees.

Meanwhile the Roman school had somewhat fallen from its supremacy, for the only great work after St. Paul's was the mosaic of saints Cosmas and Damianus (530), after which Rome suffered from the wars between the Goths and Byzantines and the attacks of the Lombards. The decline reached Ravenna in the seventh century, as is shown at Sant' Apollinare in Classe, and continued in Rome, with Italo-Byzantine stiffness, as in the works at San Lorenzo, Sant' Agnese, and San Venanzio. The coloring is still superb, but the figures are rigid and staring.

Mediæval. The Carolingian era saw a revival in both East and West about the year 800, which lasted for less than a century in Italy, but continued in the East from Basil the Macedonian to the capture of Constantinople by the Crusaders in 1204. In Rome the mosaics of the church of Santa Prassede, especially the scenes from the Apocalypse, are a masterpiece, while Santi Nereo ed Achilleo and San Marco are of secondary importance. The art did not then spread beyond Rome, as in the earlier period. Only in the Orient was it still supreme. The

real revival of the art in the West came in the eleventh century and was due to Byzantine influence and imported Byzantine artists. The two great schools were that of Sicily and Campania, with its masterpieces of Cefalù, Palermo, and Monreale, and that of Venice, represented at San Marco, Torcello, and Murano. In variety of subject, in splendor of color, and in sheer amount, these works surpass the mosaics of the fifth and sixth centuries.

The Roman school took part in this revival, but mingled antique traditions with Byzantinism, and retained a freedom and beauty of decoration and detail foreign to the other schools. It can best be studied at San Clemente, Santa Maria in Trastevere, Santa Maria Maggiore, and St. John Lateran. In some of these works we can trace the first steps in the great revival of painting usually connected with the names of Cimabue and Giotto.

Meanwhile the mediæval mosaicists had been executing pavements far more beautiful than any geometric floors of antiquity. The Byzantine school, as usual, took the lead, and the exquisite designs and coloring of the pavements of San Marco and the Torcello Cathedral at Venice are but repetitions of the pavements of the churches of Constantinople, Saloniki, Mount Athos, Chios, and elsewhere. The Italian school, though centering at Rome, did similar work in Campania and Sicily. The small marble cubes were worked in patterns around large circular, square, long, or polygonal slabs of porphyry, serpentine, verde antico, rosso antico, or other rich marbles which formed the centre of each design.

It was not long before the geometric designs of the floors were transferred to the various details and objects in the church interiors, thus forming a perfectly harmonious whole. The altar fronts and canopies at Ferentino, the canopies at Santa Cecilia and San Paolo at Rome, the choir seats at Civitella Castellana and San Lorenzo at Rome, the pulpits at Alba Fucense, San Lorenzo, Palermo, Salerno, and Ravello, the choir screens at the two latter cathedrals and at Alba, the Paschal candlesticks at Anagni, Ferentino, Santa Cecilia, and Salerno, the episcopal thrones at San Lorenzo and Fondi, the sepulchral monuments at San Francesco in Viterbo, at the cathedral of Perugia, at Orvieto, at Assisi, Rome (Santa Maria Maggiore, Sopra Minerva, Ara Cœli, etc.), are a few among hundreds which made the interiors of churches wonderfully rich in this part of Italy.

The mosaic in geometrical patterns even invaded the field of architecture. The portals were surrounded by it; it formed the main decoration of the colonnaded porticoes, and even of the cloisters. The cloisters of San Paolo and of the Lateran at Rome would lose all their beauty if their columns and friezes were divested of the color and design given them by mosaics. Even Tuscan church architecture felt this influence to the extent of obtaining a faintly similar effect by *opus sectile* with broader design—as at Pisa (baptistery) and San Miniato, near Florence.

None of the European countries besides Italy and Greece used mosaics. An occasional work is found in Germany, France, or England; but, as at Westminster Abbey, it is the work of an Italian or a Greek. Only in Russia, as at Kiev and Novgorod, can we trace the existence of a regular branch of the art.

Mohammedan. The art passed from the Byzantine Greeks in the East to the Mohammedans

and was used by them for pavements and the revetments of walls in nearly all the schools, especially in Egypt, Spain, and Syria. Figured mosaics were substantially forbidden by the law of the Prophet, so that decorative, and especially geometric, patterns were alone used. Mosques, fountains, palaces, baths, and other buildings, between the tenth and fifteenth centuries, had them in profusion. The mosques of Cairo (see MOSQUE) contain an unbroken series which is paralleled in the old Coptic churches of the city. It is probable, in fact, that most of the mosaicists of the mosques were Christian Copts. The Alhambra at Granada contains dados of this geometric ornament, though here and in Syria, and especially in Persia, it was less used than the enameled tiles.

Renaissance and Modern. With the rise of the Giottesque school early in the fourteenth century the golden age of mosaic painting ended, frescoes taking its place. Such works as appear on the façades of Orvieto and Siena cathedrals by Orcagna and his contemporaries in the fourteenth century are purely decorative. Henceforth mosaic loses its individuality and seeks to imitate the delicate soft tones of fresco and then of oil. Great artists like Raphael (Santa Maria del Popolo, Rome), Titian, and Tintoretto (San Marco, Venice) furnished cartoons to be carried out by mosaicists, who are no longer artists, but mechanics. The atelier of the Vatican, busy producing altarpieces for St. Peter in exact imitation of masterpieces in oils, multiplying shades and minimizing the size of the mosaic cubes, has perfected this mechanical method. The atelier at Venice is the only other modern centre of importance. These modern artisans, in their restorations of mediæval mosaics, have done immense damage by trying to improve the originals. They no longer apply the cubes directly to the wall, but set them up in portable compartments, transferring the whole design to the walls by mechanical means.

During recent years the art has experienced a revival of a more independent character, especially in the United States. The improvements in the manufacture of glass, especially of the iridescent varieties, and the possibility of cutting glass into the exact forms of the design, have changed the character of the art, making it possible to follow exactly the design and the colors of nature. The Tiffany studios in New York have been chiefly instrumental in making these improvements. Among the best examples of American mosaic are the chancel of the crypt of the cathedral of St. John the Divine in New York, designed by Louis Tiffany; several designs in the Wade Memorial Chapel and the Huntington Mortuary Chapel, both in Cleveland, Ohio, and elsewhere, by Frederick Wilson, and the colossal mosaic curtain, 2500 square feet, of the National Theatre, Mexico—all products of the Tiffany studios.

It is interesting to note that the ancient Americans, especially the Incas and Mexicans, practiced mosaic. The Aztecs, who learned from their predecessors, the Toltecs, thus adorned their ceremonial masques of the gods, knife handles, and objects of adornment, substituting turquoises and shell for cubes of glass, which they did not possess. The best collection of ancient American mosaics is in the British Museum.

Bibliography. The subject of mosaics is well treated in Woltmann and Woermann, *History of Painting* (Eng. trans., New York, 1880);

a good general monograph is Edouard Gerspach, *La mosaïque* (Paris, 1885). The technique is carefully described by Eugène Muntz in *La mosaïque chrétienne* (Paris, 1893). All the mosaics of the Roman churches are reproduced in large colored plates and described by G. B. De Rossi, *Mosaici cristiani di Roma* (Rome, 1876-96). The same has been done for those of St Mark's in Venice by Organa in *La basilica di S. Marco* (Venice, 1881-88); for Monreale by Gravina, *Il duomo di Monreale* (Palermo, 1859). All the figured mosaics earlier than 900 A.D. are outlined and described in Raffaele Garrucci, *Storia dell' arte cristiana* (Prato, 1873-81). Consult also: Otto Pohl, *Die altchristliche Fresko- und Mosaikmalerei* (Leipzig, 1888), and Julius Kurth, *Die Mosaiken der christlichen Aera* (ib, 1902 et seq.); W. J. Furnival, *Leadless Decorative Tiles, Faience, and Mosaic* (Philadelphia, 1904); Barwell and Druitt, *Mosaics and Stained Glass* (New York, 1909). See CHRISTIAN ART.

MOSAIC GOLD. See GOLD.

MOSAIC WOOL. See RUGS.

MOSASAU'RIA (Neo-Lat., from Lat. *Mosa*, the river Meuse + Gk. *σαυρος*, *sauros*, lizard). An order of extinct marine reptiles—the Pythonomorpha of Cope. The reptiles possessed the slenderness of a snake combined with strong paddles, such as those of the whale, together with many lizard-like characters. The first specimen of a nearly perfect head skeleton was discovered in 1780 in the upper chalk of St. Pietersberg in Holland, on the Meuse River. A few other specimens have been found in the Cretaceous of England and Europe. In North America this reptile seems to have attained its most flourishing existence, for over 50 species, included in several genera, have been found. The Cretaceous of New Jersey has yielded 15 species. The Yale College collection contains a great number of specimens. *Mosasaaurus princeps* from New Jersey is estimated to have been 40 feet long, and *Tylosaurus dyspeltor* from Kansas was about 30 feet in length. Consult: A. C. Marsh, "Cretaceous Vertebrates of the West," in *United States Geological Survey Reports* (Washington, 1875), F. A. Lucas, "Animals of the Past," in *American Museum of Natural History, Handbook Series*, No. 4 (New York, 1913), S. W. Wiliston, *Water Reptiles of the Past and Present* (Chicago, 1914).

MOSBY, mōz'bi, JOHN SINGLETON (1833-1916). An American soldier in the Confederate service, born at Edgemont, Powhatan Co., Va. He was educated at the University of Virginia, studied law, and was practicing his profession at Bristol, Washington County, Va., at the outbreak of the Civil War. After serving under Joseph E. Johnston in the Shenandoah valley in the winter of 1861-62, he was appointed by Gen. J. E. B. Stuart an independent scout, and guided that officer's cavalry in a bold raid in the rear of McClellan's army on the Chickahominy in June, 1862. Returning to Richmond after a short captivity early in 1863, Mosby recruited an independent body of cavalry for scouting and raiding purposes, and he then began his remarkable career as a leader of an irregular force of cavalry known as rangers, which frequently disbanded when hard pressed, only to reassemble at a signal and renew operations, practically guerrilla in character. The force was subsequently organized as a regular branch of the Confederate service as the Forty-third Battalion of Virginia Cavalry.

His most brilliant exploit was the capture, in March, 1863, of Brigadier General Stoughton, U.S.A., at that officer's headquarters at Fairfax Courthouse, which he accomplished by a raid inside the Federal lines. Promoted to be major as a reward for this capture, he followed Lee's army into Pennsylvania in June, 1863, and worried the flanks of the Federal army as it moved southward after Gettysburg. In January, 1864, he was repulsed with considerable loss in a night attack on Harper's Ferry. In May he harassed the rear of Grant's army as it advanced on Fredericksburg, and later made a long raid in Maryland. In August he made one of the most important captures of his career, consisting of Sheridan's entire supply train, which he surprised near Berryville. In September he was wounded at Falls Church, but in the following month was again in the saddle, captured two Federal paymasters with \$168,000 in greenbacks, tore up the Baltimore and Ohio Railway tracks, destroyed rolling stock, and made a prisoner of Brigadier General Duffié. In December, 1864, he was promoted to be colonel. After being disabled for a short time by a wound, he continued his operations until Lee's surrender, when he disbanded his troops and surrendered. On account of his methods there was much feeling against him, but through General Grant's intercession he was paroled. After the war he opened a law office at Warrenton, Va., and became a member of the Republican party, which he thought could best settle the question of reconstruction satisfactorily. From 1878 to 1885 he was United States Consul at Hongkong. On his return to America he established himself in law practice for a while in San Francisco. From 1904 to 1910 he was assistant attorney in the Department of Justice, Washington. He published an account of his exploits entitled *War Reminiscences and Stuart's Cavalry Campaign* (1887) and *Stuart's Cavalry in the Gettysburg Campaign* (1911). Consult: John Scott, *Partisan Life with Mosby* (New York, 1867), J. H. Alexander, *Mosby's Men* (New York, 1907), J. J. Williamson, *Mosby's Rangers* (ib, 1909).

MOSCHELES, mō'she-lēs, FELIX (1833-) An English painter and author, son of Ignaz Moscheles. He was born in London and studied art in Paris and under Van Lerius in Antwerp. Afterward he exhibited in Antwerp, at the Paris Salon, and at the Academy and Grosvenor and New galleries in London. His works include genre scenes and portraits of Mazzini, Gounod, Browning, Rubinstein, Stanley, and Grover Cleveland. His publications include *Felix Mendelssohn's Letters to Ignaz and Charlotte Moscheles* (1888); *In Bohemia with Du Maurier* (1897), *Fragments of an Autobiography* (1902). Active in the cause of international arbitration and peace, he wrote and lectured concerning it, and he became president of the International Arbitration and Peace Association.

MOSCHELES, IGNAZ (1794-1870). An Austrian piano virtuoso and composer, born in Prague, of Jewish parentage. After a course of study at the Prague Conservatory he went to Vienna, where he became a pupil of Albrechtsberger and Salieri. He was a remarkable improvisator and won his greatest successes as much by that gift as by the more important discovery of the "singing tone" by which he secured modifications of tone and variations in tone color by means of touch—an art subse-

quently developed by Liszt and his school. Although he was very successful in his tours of Russia, Holland, Germany, and France, his greatest fame was won in London, in which city he took up his residence in 1821. He did not, however, sever his connection with the Continent, for in 1824 he was giving lessons in Berlin, where he numbered Mendelssohn among his pupils, and formed a friendship with him that was of great mutual profit. He was of much assistance to Mendelssohn when that master first visited England, and was in turn persuaded to join Mendelssohn in the management of the newly formed Leipzig Conservatory (1843). In 1846 he settled permanently in Leipzig, where he taught at the conservatory until his death. With the exception of a collection of studies which are still highly esteemed, his compositions are forgotten. His works include piano concertos, arrangements, instrumental chamber music, sonatas, and numerous études, about 140 opus numbers altogether. He died in Leipzig. Consult *Aus Moscheles' Leben: Nach Briefen und Tagebuchern herausgegeben* (Leipzig, 1872), English translation by A. D. Coleridge.

MOSCHEROSCH, mō'she-rōsh, JOHANN MICHAEL (1601-69). A German satirist of the seventeenth century. He came of an old Spanish family and was born at Willstett, near Strassburg, and wrote under the name Philander von Sittewald. He studied in Strassburg, and held various diplomatic positions. He was admitted to the Fruchtbringende Gesellschaft in 1645 with the name of "Dreamer," and about 1640 published his "Book of Visions," *Wunderliche und wahrhaftige Geschichte Philanders von Sittewald*, a sharp satire of the times, apparently patterned after Quevedo's *Sueños*. Consult: Nickels, *Moscherosch als Padagog* (Leipzig, 1883); Pariser, *Beiträge zu einer Biographie von Moscherosch* (Munich, 1891); Erich Schmidt, *Charakteristiken*, vol. i (2d ed., Berlin, 1902); Kürschner, *Deutsche Nationalliteratur*, vol. xxxii.

MOSCHI, mōs'ki (Lat., from Gk. Μόσχοι, *Moschoi*). An ancient people of Asia Minor, living south of the Caucasus. According to Herodotus (ii, 94; vii, 78) they dwelt between the sources of the Phasis and the Cyrus, east of the Euxine. Under the appellation of the Mushkaia, or Mushki, they appear in the Assyrian inscriptions as carrying on war against Tiglath-pileser I (c 1140-1105 B.C.), who defeated their forces and overthrew their five kings, and as paying tribute to Asurnasirpal III (885-860 B.C.). Mita, King of Mushki (possibly Midas of Phrygia), was in alliance with the kings of Urartu (see CHALDIANS) and Tabal. Mushku is also mentioned in the inscriptions of Sargon II (722-705 B.C.). According to Sayce most of the Hittite hieroglyphic inscriptions come from the Hittite Empire established by the Moschi about 1200 B.C., of which Tyana was the capital. The name of the Moschi is often coupled with that of Tabal or the Tabareni. In the Bible they are spoken of as Meshech and Tubal. Consult Friedrich Delitzsch, *Wo lag das Paradies?* (Leipzig, 1881), and A. H. Sayce, in *Expository Times* (London, November, 1914).

MOSCHINÆ, mōs-ki'nē. See CERVIDÆ

MOSCHUS, mōs'kūs (Lat., from Gk. Μόσχος, *Moschos*). A Greek bucolic poet of the middle of the second century B.C., a native of Syracuse

in Sicily. He was a pupil at Alexandria of Aristarchus of Samothrace (q.v.), and himself wrote a prose work on Greek grammar. We possess his "Rape of Europa" (Εὐρώπη) and his epigram "Cupid the Runaway" (Ἔρως Δραπετής). To him also was long ascribed the "Lament for Bion" (Ἐπιτάφιος Βίωνος), a poem in hexameter verse; this Bion was Bion of Smyrna (q.v.), whom some wrongly regarded as teacher of Moschus. But modern scholars have held that the poem was written rather in the time of Sulla. His poems were united in antiquity with those of Theocritus and Bion, and appear with them in modern editions also (cf., e.g., that of Wilamowitz-Moellendorf, Oxford, 1905). His extant poems were translated by Lang (London, 1896) and by J. M. Edmonds, *The Greek Bucolic Poets* (London, 1912). Consult Christ-Schmid, *Geschichte der griechischen Literatur*, vol. II (5th ed., Munich, 1913).

MOSCOSO DE ALVARADO, mōs-kō'sō dā il'va-ra'bō, LUÍS DE (1505-c.61). A Spanish soldier and explorer in America. He was born in Badajoz, and was a kinsman of Pedro de Alvarado, whom he followed to Peru (1534). Four years afterward, with De Soto, he started for Florida, and succeeded him in command in 1542. After terrible privations and with decimated forces he reached Mexico in 1543. There Mendoza received him kindly. In 1551 Moscoso accompanied Mendoza to Peru, where he died.

MOSCOW, mōs'kō (Russ. *Moskva*). A government of central Russia, bounded by the Government of Tver on the northwest, Vladimir on the northeast, Riazan on the east, Tula and Kaluga on the south, and Smolensk on the west (Map: Russia, E 3). Area, 12,859 square miles. It occupies a portion of the central plateau of Russia, and slopes eastward towards the Oka. It belongs to the basin of the Volga and is watered by that river and the Oka on the boundaries, and by the Kljama, Moskva, and other rivers in the interior. Geologically the government belongs to the Moscow coal basin, the carboniferous formation being covered up with various clays, sandstone, and marble. The soil is loamy and not very fertile. About 40 per cent of the area is clothed in forests, mostly belonging to private persons.

Agriculture is highly developed and the farm products are of great diversity. Rye, potatoes, and oats are the staples. Gardening is carried on extensively, and vegetables are raised in quantities sufficient to be exported to St. Petersburg and Kronstadt. Stock raising is also important.

Moscow is the leading manufacturing government of Russia. In 1913 its manufacturing establishments exceeded 2400, employing over 200,000 hands. The value of the output of that year was approximately \$200,000,000. The chief products are textiles (especially cotton and silk), of cotton factories alone there were in that year some 350, with more than 100,000 workers, and an output valued at about \$55,000,000. Other important products are machinery, brick, chemicals, knit goods, etc. The house industry is still very important and has reached here a higher degree of development than in any other part of Russia. It exists throughout the government, groups of villages being engaged in the manufacturing of one product. The articles manufactured in this way are of a very wide range, including leather and leather products, hats, pins, brushes, cheap

chromos, carriages and wagons, lace, gloves, etc. It is estimated that agriculture furnishes on the average only about 40 per cent of the income of a peasant family in the government.

The commerce in the products of the house industry is of great extent and is centred chiefly in the city of Moscow. The government is well supplied with transportation facilities, being traversed by six of the most important railway lines of the Empire. Education is poorly provided for. The proportion of illiterate is estimated at 80 per cent. Pop., 1912, 3,303,400, chiefly Great Russians (99.6 per cent in rural districts). Capital, Moscow.

MOSCOW. The second capital and historically the most famous city of the Russian Empire, capital of the military district and government of the same name, and the second largest city of Russia. It is situated on the river Moskva (a tributary of the Oka) in lat. 55° 45' N. and long 37° 37' E., 400 miles southeast of St. Petersburg, at an altitude of from 500 to 850 feet above the level of the sea (Map: Russia, E 3). It has a rather cold climate, the annual temperature being 40.1° F., ranging from a mean of 14° in January to 66.5° in July. The summers are quite warm (in July temperature reaches 100° F.), and the winters dry and cold, snow remaining on the ground most of the season.

The city is irregularly built. On the north bank of the river rises the Kremlin, the acropolis of old Moscow, for many centuries the centre of the political and religious life of Russia and still the most venerated place in the heart of every Russian. It was the nucleus of the modern city and contained in the early periods of the history of Moscow the palace of the Czar, the chief churches and monasteries, and the palaces of the nobility. As the city developed, the merchants and the numerous artisans began to settle outside of the walls. Thus grew up the commercial quarter east of the Kremlin, known as the Kitai Gorod (Chinatown), still constituting the commercial centre of Moscow, and numerous small communities independent in their internal administration and composed mostly of members of the same trade. These divisions are still retained to a large extent in the parishes into which the city is divided. They were subsequently grouped together and surrounded by walls, and now form the Byely Gorod (white town), surrounding the Kremlin and the Kitai Gorod, and the Zemliany Gorod (earthen town), inclosing all the above-mentioned quarters as well as Zamokvoretchye, on the southern bank of the river. There is also a fourth inclosure, Kramer-Kollezh (earthen wall), surrounding the outer parts of the city and forming the limits of Moscow proper. Only the walls of the Kremlin and of the Kitai Gorod have been preserved, all others having been converted into boulevards and avenues. See KREMLIN for illustration.

Although one of the oldest cities of Russia, Moscow has preserved comparatively few architectural monuments outside of its churches and monasteries, most of the old buildings having perished in the destructive conflagrations which figure so prominently in the history of the city. With the introduction of Western civilization into Russia by Peter the Great and his successors, the Russian style of architecture gradually disappeared in practically all the secular and private buildings, and the application of West-

ern standards not infrequently produced very peculiar effects. Under Alexander II a revival of Russian architecture was inaugurated and a number of successful restorations have since been made. The chief interest of Moscow, as already stated, is centred in the Kremlin, both for its historical associations and for its churches and monasteries, with their semibarbaric splendor and curious architecture. The Kremlin is nearly triangular in shape and surrounded by a wall about a mile and a half long. The wall is surmounted by 18 towers and pierced by five gates, among which is the Spasskiya Vorota (Gate of the Redeemer), one of the most revered historical places of Russia, and associated with many of the chief events of national history. Within the walls of the Kremlin the most famous edifice is the Uspensky Sobor (Cathedral of the Assumption), in which all the Russian monarchs since Ivan IV have been crowned. The present building was erected by Aristotelo Fioraventi in the fifteenth century on the site of an older church founded in 1326. It is Lombardo-Byzantine in style, with Indian cupolas. The semidark interior is adorned with numerous icons, covered with gems and precious metals. They are of great antiquity, one of them being attributed to St. Luke. The treasury of the cathedral, one of the richest in Russia, contains many valuable Bibles, manuscripts, and sacred vessels, as well as numerous relics of saints. The cathedral of St. Michael the Archangel is the former burial place of the Russian monarchs. It dates, in its present form, from the beginning of the sixteenth century and is surmounted by five domes, the central one being of gilt. The interior is richly decorated and its walls are covered with the portraits of the Russian monarchs interred there. In the partly Gothic Cathedral of the Ascension, founded in 1307, the walls and the thick pillars are covered with portraits of saints and Greek philosophers, and the floor is made of semiprecious stones of various colors.

One of the sights of the Kremlin is the tower of Ivan the Great, 322 feet high and crowned by a gilt dome, it contains 34 bells, weighing altogether about 580,000 pounds. In former times the Kremlin contained numerous monasteries and convents, of which only a few have been retained. The most interesting of these are the Maiden Convent, for centuries the burial place of the Russian princesses, and the Tchudov Monastery, an institution of great historical importance as well as a great factor in the development of ecclesiastical learning in Russia. Near the tower of Ivan the Great stand two objects very famous in Russia. One is the Czar Bell, cast in 1735 and now resting on a stone pedestal. Part of the bell, broken off during the fire of 1737, lies near by. It is over 60 feet in circumference around the rim, 19 feet high, and weighs about 200 tons. The other, near the Museum of Arms, is the Czar Cannon, cast in 1586, and weighing nearly 40 tons. The palaces of the Kremlin are mostly modern, and only a few portions of the old abode of the Russian monarchs have survived. The great palace, completed in 1849, is a vast building of white stone with a gilt cupola, and possessing numerous magnificent halls devoted to the different orders of Russia. Attached to it are the living rooms of the old Russian rulers, known as the Terem and dating from the seventeenth century. They are of great architectural value.

and well preserved. Connected with the palace are the old banquet hall known as Granovitaya Palata, with its red stoop, from which Russian monarchs used to address the populace, and the Oruzhaynaya Palata (hall of arms), containing immense treasures, such as crowns, sceptres, thrones, costumes, banners, armor, gold and silver plate, carriages. The palace of the patriarch, built by Nikon in 1655, has one of the most valuable libraries in Russia and a treasury of fabulous wealth. The arsenal of the Kremlin is one of the largest in the world.

The Kitai Gorod, adjoining the Kremlin, also has many historical associations. Especially noteworthy is the Red Square, used repeatedly as a camp by the besieging Mongols, as a forum by the Russian monarchs, and as a place of execution. Facing the Red Square is the cathedral of Vasil the Beatified, which for mixture of styles, colors, and architectural lines has few equals in the civilized world. It was built by an Italian architect at the command of Ivan the Terrible in 1554 to commemorate the conquest of Kazan, and consists of a number of separate buildings under separate cupolas, differing from each other in form, dimension, and glaring colorings. The interior does not differ essentially from those of the other great churches of Moscow, being dark, close, and covered with paintings, gold, and gems in great profusion. Contrasting favorably with the cathedral of Vasil the Beatified is the modern church of the Saviour, consecrated in 1881 in commemoration of the destruction of Napoleon's Grand Army in 1812. It is Lombardo-Byzantine in style, cruciform, and well proportioned, built of white marble and surmounted with five cupolas. The paintings and the marble reliefs of the interior have been executed by the best artists of Russia.

In the centre of the Red Square stands the monument to Minin and Pozharsky, who liberated Moscow from the Poles in 1612. The Greek Monastery of St. Nicholas in the Kitai Gorod deserves special mention for its influence on education in Russia. It was under the auspices of the monks of St. Nicholas that the first Russian academy for classical education was established in the seventeenth century. It numbered among its pupils Lomonosov and others prominent in the literary and the political life of the country. The Kitai Gorod possesses a number of old residences of the boyars (see BOYAR), of which the most interesting is the family house of the Romanovs, faithfully restored in 1859. The Gostiny Dvor, the centre of the retail trade of Moscow, is architecturally also very interesting. Other noteworthy secular buildings and monuments are the Petrovsky Palace, occupied by Napoleon during his stay at Moscow, the town hall (duma), the Sukharev Tower (1692-95) with the reservoir, the triumphal arch, etc. Moscow has extensive markets, of which probably the most interesting is the Tolkuchy, where second-hand clothes are sold. In the most northern quarter of the Zemliany Gorod are still found many stately, though somewhat decayed, mansions of the old nobility, while Zamoskvorechye, on the opposite side of the river, is the stronghold of the wealthy merchant class.

Economically, Moscow is exceedingly important, both with regard to industries and commerce. The manufacturing industries date from the time when the city was the residence of the court and attracted skilled artisans from all

over Russia as well as from foreign countries. At present Moscow is the second-largest manufacturing city of the Empire and the centre of the textile industries, furnishing a considerable portion of the cotton goods for the Asiatic trade. The textile industry ranks first, with over 200 factories, 50,000 workers, and an output exceeding \$100,000,000. Next to textiles are foodstuffs, metal products, paper, leather and wood products, and machinery. As early as the fourteenth century Moscow was an important commercial centre. Its trade grew up with the political power of the Principality of Moscow, and received a great stimulus from the settlement of the Novgorod merchants. The advantageous position of the city at the convergence of six railway lines, which connect it with every part of European Russia as well as with Siberia, has played an important part in its commercial development. Manufactures, agricultural products from the southern and the central provinces of Russia, minerals from the coast, and tea from Asia, all find their way to Moscow and go partly to supply the local demand and partly to supply the trade with the interior or with foreign countries. The rise of St. Petersburg had at first a detrimental effect on the foreign trade of Moscow, but the development of the Asiatic trade, of which Moscow is the natural centre, has more than compensated for the loss in any other direction. The trade by water is important. About 338,000 tons of goods are imported annually, other chief imports being tea, iron and steel products, raw silk, indigo, cotton yarn, etc.

Moscow is administered by a governor general, who is also at the head of the military district of Moscow. The municipal council of 160 members is elected by owners of real estate and merchants of the first class, and has an executive committee of six members. Both the municipal council and the executive committee are presided over by the mayor (*golová*), who, unlike the mayors of all other Russian towns save St. Petersburg, is appointed by the government from two candidates suggested by the council.

The budget of the city for 1914 exceeded \$21,000,000, more than half of which was derived from municipal undertakings, whose number is rapidly increasing in Moscow. The chief items of revenue are real estate and internal taxes, which yield about one-quarter of the revenue, subvention from the Imperial government, the zemstvo, and returns from municipal property and enterprises. About one-third of the revenue is spent on sanitation, while the amount expended on education has greatly increased since 1913, due to the passage of a universal education bill. In 1913 this approximated \$2,500,000. The municipality owns the water works, slaughterhouses (with cold-storage facilities), baths, and a number of lodging houses, while municipal bakeries and market places are under consideration. In regard to facilities for local transportation Moscow is far behind most European cities of equal size and importance, but is making rapid progress in this direction as in many others. Moscow has many prominent educational establishments. Besides the university (see MOSCOW, UNIVERSITY OF) there are a theological seminary, a technical school, an agricultural institute, an institute for the study of Oriental languages, schools of art, painting, and architecture, a school of engineering, two

MOSCOW

1. CATHEDRAL OF VASILI THE BEATIFIED
2. CHURCH OF THE SAVIOUR

seminaries for teachers, a number of dramatic schools, a commercial institute, 21 Gymnasias, five Realschulen, a school of Church music, and numerous other special schools. Libraries are numerous. The most important museums and collections are the Rumiantzev Museum, consisting of a fine library and collections of paintings, sculptures, ethnography, etc., the historical museum, and the Tretyakov Gallery of modern paintings, now belonging to the city. A number of prominent scientific organizations have their home at Moscow, including the society of naturalists and the society of Russian history and antiquities. The numerous archives of Moscow are also noteworthy. The benevolent institutions, especially the founding asylum, are among the largest in Russia. The theatres of Moscow, especially the "small theatre," have played a prominent part in the development of Russian drama. The periodical publications of Moscow are numerous, and the book trade of the city, especially that handling popular publications, is very extensive.

The population of Moscow has increased from 602,000 in 1871 to 1,635,000 in 1913. The predominance of males is very marked. About 50 per cent of the population belong to the peasantry. The Greek Orthodox inhabitants constitute about 94 per cent of the total population of Moscow, as compared with 84 per cent in St. Petersburg. There are 2 per cent of Lutherans and 1 per cent Roman Catholics. The environs of the city are replete with historical interest and contain many estates of the old nobility and royal favorites, among which may be mentioned the Petrovsko-Razumovskoye, with its extensive park and academy of agriculture. There are also many large, picturesque parks and groves, where the masses amuse themselves on holidays. Of these the Petrovsky Park, northwest of the city, is one of the most frequented. No city is so typically Russian, so expressive of the character and peculiarities of its inhabitants, and so dear to the heart of every Russian, as this old city, affectionately known as "Little Mother Moscow."

History. The site of the city was probably inhabited long before the twelfth century, but the first mention of Moscow dates from 1147, when it was the estate of the Suzdal Prince Yuri Dolgoruki. The city began to rise with the Principality of Moscow under Daniel, the son of Alexander Nevski, in the thirteenth century, and especially under Ivan Kalita (1328-40), who with the aid of the Mongols succeeded in annexing many of the minor principalities to Moscow, and greatly embellished the capital. In 1325 the Metropolitan Peter transferred his seat to Moscow from Vladimir-on-the-Khasma, thereby laying the foundation of its future position as the religious capital of Russia. In 1363 the city was besieged by Olghierd, the Grand Duke of Lithuania, and in 1382 it was burned by the Khan Tokhtamish. With the union of the Russian principalities under Ivan III (1462-1505) Moscow became the capital of Russia and began to assume the proportions and appearance of a large city. In 1520, during the reign of Vassili Ivanovitch (1505-33), the city is said to have had 45,000 dwelling houses. But the growth of the city was often interrupted by the invasions of the Tatars, conflagrations, and pests. It also suffered from internal dissensions and revolts during the seventeenth century, notably the Polish

occupation in 1610-12, the revolt of the people against the corrupt favorites of the Czar, the riots following the introduction of religious reforms by Nikon, and the rise of the Streltsi (q.v.) against the reforms of Peter the Great. Peter found Moscow unfavorable for the introduction of his reforms, and transferred the court to St. Petersburg. The University of Moscow was founded in 1755. On Sept. 14, 1812, Moscow, almost entirely deserted and with its treasures and archives removed to Vladimir, was occupied by the army of Napoleon, seven days after his disastrous victory at Borodino (q.v.). On the following day the Emperor made his entry into the city. On the night of the 15th to the 16th, in accordance with a pre-arranged plan, fires were started in several parts of the city, and soon the entire place was in flames, so that on September 16 Napoleon was compelled to remove his headquarters from the Kremlin. On October 19 the French began their fatal retreat from the city. On May 18, 1896, Moscow was the scene of a fearful disaster, brought about by the distribution of gifts at a popular festival arranged in honor of the coronation of Nicholas II. Over 2000 people were crushed to death and many more wounded. The city was a centre of revolutionary disturbances in 1905-06. On Feb. 17, 1905, Grand Duke Sergius was assassinated in the Kremlin. Zemstvo congresses assembled in September and November. On December 21 the revolutionaries rose in armed revolt, and there was fighting for a week before the insurrection was suppressed. Five thousand are supposed to have perished.

Bibliography. M. P. Fabricius, *Le Kremlin de Moscou* (Moscow, 1883); Eugen Zabel, *Moskau* (Leipzig, 1902); Ivan Zabyelin, *History of Moscow* (Moscow, 1902); H. M. Grove, *Moscow* (New York, 1912); Wirt Gerrare, *Story of Moscow*, in "Medieval Towns Series" (ib., 1912); J. J. Hartmann, *Moskau* (Zürich, 1913).

MOSCOW. A city and the county seat of Latah Co., Idaho, 94 miles south-southeast of Spokane, Wash., on the Northern Pacific and the Oregon-Washington Railroad and Navigation Company lines (Map Idaho, A 3). It is the seat of the agricultural and mining schools of the University of Idaho (q.v.), and has a Carnegie library and fine high-school and Federal buildings. Mining, farming, fruit growing, stock raising, and lumbering are the leading industries, and there are some manufactures. The water works are owned by the city. Pop., 1900, 2484. 1910, 3670.

MOSCOW, UNIVERSITY OF. The oldest and largest institution of higher learning in Russia, organized in 1755. At its inception it consisted of three faculties—law, medicine, and philosophy—with a total staff of 10 professors, mostly brought from western Europe. The curriculum was very limited in its scope until 1807, when it was reorganized by Alexander I. At the burning of Moscow in 1812 the university buildings were destroyed. The most valuable collections, however, had been previously removed. Instruction, suspended for a while, was resumed in 1813, and new buildings were erected in 1816-19. In 1835 the number of chairs was increased to 35 and a uniform four years' course established for all departments. In 1841 the Medico-surgical Academy was united with the University. The liberal University Act of 1863

gave the professors and students a certain amount of self-government, which was abolished during the reactionary régime of Alexander III in 1884. In 1902 Moscow University consisted of the following faculties: (1) medicine, (2) law, (3) physical and natural sciences, (4) historico-philological faculties. It offers four-year courses leading to the degree of candidate. In the medical school, however, the course covers five years, the regular degree being physician. The degrees of master, doctor of the various sciences, and M.D. are conferred for special investigation. The university library contains nearly 400,000 volumes and 29,000 pamphlets. The departmental libraries, laboratories, observatories, museums, etc., number altogether 33. The medical department has 25 special institutes, clinics, and hospitals. The number of students in 1913 was 9760. The expenditures of the university amounted to 2,595,075 rubles. As the majority of the students come from the poorer classes, the number of scholarships is very large, and they provide for about one-tenth of the students. The university is under direct supervision of the Minister of Public Instruction, who appoints the rector. There is a university council, but its powers are limited.

MOSEILIMA, mō-si'lē-mā (Ar. *Musailimah*, from the proper name *Muslimah*, from *salima*, to be safe). One of the most important of the rival prophets who came forward in Arabia when Mohammed had stirred the religious thought of the people. He belonged to the tribe of the Beni Henifah, of Yamama in Nejd. The traditions about his life and age are extremely contradictory and legendary. It appears, however, tolerably certain that he had risen to a certain eminence in his tribe, probably at first only as a religious teacher, before Mohammed assumed his prophetic office. He seems to have proposed to divide the religious leadership with Mohammed, a suggestion which the latter contemptuously refused. He never undertook to supplant Mohammed. After the death of the Prophet, Moseilima set up the standard of open opposition and was defeated and killed in a desperate battle by Khalid, who had been sent against him by Abu Bekr. His "heresy" was stamped out, and only a few scattered supporters escaped to El Hasa and Basra, where they may have laid the foundation of the later Karmathian creed. See MOHAMMEDAN SECTS.

MOSELEY, mōz'li, EDWARD AUGUSTUS (1846-1911). An American economist and authority on railroads, born at Newburyport, Mass. After 1862 he made several voyages on vessels engaged in East Indian trade. Later he studied law, was admitted to practice before the Supreme Court of the United States, and served in the Massachusetts Legislature. When the Interstate Commerce Law was passed in 1887, Moseley became secretary of the Interstate Commerce Commission, which he helped to organize. During the American occupation of Cuba he assisted in drafting railroad laws for that island. In 1902 he was one of the assistant recorders of the Anthracite Coal Strike Commission. His publications include: *Integration as Applied to Railway Corporations and their Employees* (1893), *Federal Supremacy* (1907), and various pamphlets.

MOSELEY, HENRY (1801-72). An English mathematician, born at Newcastle-under-Lyme. He graduated at St. John's College, Cambridge, studied theology and was ordained a priest of

the Church of England in 1828, and in 1831-44 was professor of natural and experimental philosophy and astronomy at King's College, London. In the latter year he was made an inspector of normal schools. In 1853 he was appointed canon of Bristol Cathedral and two years afterward became chaplain to the Queen. Moseley, in a paper published in the *Philosophical Transactions of the Royal Society* in 1850, announced the formulae for the dynamical stability of warships, which have come into common use. His works include: *A Treatise on Mechanics, Applied to the Arts* (1834), *Astro-Theology* (1838, 3d ed., 1860), *Lectures on Astronomy* (1839, 4th ed., 1854), *The Mechanical Principles of Engineering and Architecture* (1843, 2d ed., 1855), his most important book, edited by Prof. Dennis Hart Mahan (q.v.), for the use of students at West Point, and translated into German by Professor Schesler, of Brunswick, *Theoretical and Practical Papers on Bridges* (1843).

MOSEL/LA. The name of a Latin poem, by Ausonius (q.v.).

MOSELLE, mō-zēl', Ger. MOSEL, mō'zel. One of the principal affluents of the Rhine. It rises on the west slope of the Vosges Mountains in the northeast corner of France, flows northward to the French boundary, then northward past Metz and Thionville, after which it turns to the northeast, and with many windings through the Prussian Rhine Province, being for a time the boundary between the Grand Duchy of Luxemburg and Germany, enters the Rhine at Coblenz (Map Germany, B 3). Throughout the greater part of its length the Moselle runs through a narrow valley occupied by fertile fields and meadows and inclosed by steep hills and mountains, in many places becoming rocky cliffs. In the lower valley the hills are vine-clad, producing the celebrated Moselle wines, noted for their delicate aromatic flavor. Numerous ruins and historic landmarks also make the valley notable. The total length of the river is 314 miles, it is navigable downward from Frouard for small vessels. From Metz to the frontier it is canalized. Two lines of steamers ply regularly between Coblenz and Treves. The steam was followed in the fall of 1914 by the Army of the Moselle in the attempt of the Germans to reach Paris. See WAR IN EUROPE. Consult W. M. Davis, *Geographical Essays: The Seine, the Meuse, and the Moselle* (Boston, 1909), and Charles Tower, *Along Germany's River of Romance: The Moselle* (New York, 1913).

MOSEN, mō'zen, JULIUS (1803-67). A German author, born at Marney in the Vogtland, Saxony. He attended the University of Jena, where Goethe awarded him the first prize for his competitive anniversary poem on Karl August's fiftieth birthday; completed his studies at Leipzig in 1826-28, and from 1828 to 1831 was in the office of an advocate at Markneukirchen. In 1834 he settled in Dresden as a lawyer and became prominent in literature. He went to Oldenburg in 1844 under appointment from Grand Duke Paul Frederick August as dramaturgist of the Hoftheater with title of counselor. His activity in that post was interrupted by illness, and from 1850 he was pensioned. His first public success was achieved by the epic *Laed vom Ritter Wahn* (1831), based on the Italian legend of *Il cavaliere Senso*, and his reputation was much increased by *Ahasver*

(1838), a second poem in that kind, whose large, historical action is somewhat impeded by its philosophy. The *Gedichte* of 1836 (2d ed., 1843) include the well-known ballads, long since established as Volkslieder, "Andreas Hofer," "Der Trompeter an der Katzbach," and "Die letzten Zehn vom vierten Regiment," descriptive of an episode in the Polish contest for independence. Of his works of fiction the best, perhaps, are the *Bilder im Moose* (2 vols., 1846), short stories, finished in workmanship. His dramas were overweighed with the rhetorical exposition of his ideas on politics and history. *Otto III.* (appeared with three others as *Theater*, 1842) was the most important. As dramaturgist, he did much to further German drama, especially Shakespearean presentations. An excellent collective edition of his works is that issued by his son in 1880 (6 vols., Leipzig). Consult the anonymous biography, *Julius Moser* (Oldenburg, 1878), *Allgemeine deutsche Biographie*, vol. xvii (Leipzig, 1885); Julius Moser, *Erinnerungen* (Plauen, 1893).

MOSENTHAL, mō'zen-tal, JOSEPH (1834-96). A German-American musician, born at Cassel. He studied under his father and Spohr and in 1853 came to America, where he played the organ in Calvary Church, New York City, from 1860 to 1887. He was conductor of the Mendelssohn Glee Club in New York City from 1867 to 1896, played a first violin in the Philharmonic Orchestra for 40 years, a second violin in the Mason and Thomas Quartet for 12, and composed much Church music, such as the psalm "The Earth is the Lord's," and part songs for male voices, *Thanatopsis*, *Blest Pair of Sirens*, and *Music of the Sea*.

MOSENTHAL, SALOMON HERMANN VON (1821-77). A German dramatist. He was born at Cassel, studied at Marburg, and in 1850 became an official in the Ministry of Public Instruction at Vienna and was soon afterward appointed ministerial archivist. His investiture with the Order of the Iron Crown in 1871 conferred knighthood upon him. He is chiefly known by the dramas *Deborah* (1850, numerous later editions known in English as *Leah the Forsaken*) and *Der Sonnenwendhof* (1856), which have been represented with success and translated into several languages. His plays show mastery of stage technique and effective situations, but are somewhat hollow and rhetorical. He also wrote the libretti for a number of well-known operas, notably Nicolai's *Die lustigen Weiber von Windsor* (1849) and Goldmark's *Die Königin von Saba* (1875). His collected works were published in six volumes in 1877-78. Consult *Allgemeine deutsche Biographie*, vol. xvii (Leipzig, 1885); Keller, *Nachgelassene Schriften* (Berlin, 1893); Hebbel, *Litteraturbriefe* (ib., 1901).

MÖSER, mō'zēr, ALBERT (1835-1900). A German lyric poet. He was born at Göttingen and, after studying there, became a teacher of the classical languages in Dresden. His odes, sonnets, and songs attained great popularity, especially a ballad, *Die Rose von Mais la Tour*, and are marked by much melody, by a dreamy reflective manner, and occasionally by great skill in the reproduction of classical metres. His *Gedichte* were published in 1865. Consult article by M. Schneidewin, in the *Preussische Jahrbücher*, vol. cxxi (Berlin, 1905).

MOSER, mō'zēr, GUSTAV VON (1825-1903). A popular German dramatist, born at Spandau,

May 11, 1825. Trained for the army, he entered it in 1843, and served till 1856, when he married the daughter of a wealthy landed proprietor. After an unfortunate venture in comedy, *Der weibliche Hussar*, he devoted himself to agriculture till a happy meeting with the Berlin stage director Wallner brought him back to the stage in 1861 for a career of almost unbroken popular success. Of about 100 comedies and farces, written some alone and some in coöperation with L'Arronge, Heiden, Schönthan, and others, the most noteworthy are: *Das Stiftungsfest* (1873); *Ultimo* (1873); *Der Veilchenfresser* (1876); *Der Bibliothekar* (1878); *Krieg im Frieden* (1880). He also wrote a number of plays in collaboration with others. A uniform edition of Moser's works in 22 volumes was published in 1872-94. Consult Hans von Moser, *Gustav von Moser: Vom Lieutenant zum Lustspiel-dichter* (Wismar, 1908).

MOSER, JOHANN JAKOB (1701-85). A German publicist, born in Stuttgart. He studied at the University of Tübingen, where in 1720 he became extraordinary professor of law. In consequence of some difficulties with the censor he resigned this position in 1732 and in 1736 answered a call to the University of Frankfurt-on-the-Oder. Here he incurred the displeasure of Frederick William I and in 1739 was again compelled to resign. In 1747 he became Privy Councilor and chief of the chancery in the service of the Landgrave of Hesse-Homburg, but two years later he went to Hanau and in 1751 returned to his native city, where he entered the service of the Duke of Württemberg. In 1759, being held responsible for certain manifestoes directed against the Duke, he was imprisoned in the fortress of Hohentwiel, where he remained for five years. After his release his offices were restored to him. Among his works are: *Deutsches Staatsrecht* (53 vols., 1737-54), *Neues deutsches Staatsrecht* (21 vols., 1766-75, 2 more vols. and index, 1781-82), *Deutsches Staatsarchiv* (13 vols., 1751-57), *Lebensgeschichte* (3d ed., 4 vols., 1777-83). Consult Wächter, *J. J. Moser* (Stuttgart, 1885).

MÖSER, mō'zēr, JUSTUS (1720-94). A German historian and publicist, born at Osnabrück. He studied law at Jena and Göttingen and in 1747 was chosen *advocatus patriæ*. He was sent to England in 1763 on financial business of the allies. During the minority of the Duke Frederick of York, who afterward became Bishop of Osnabrück, Moser was the principal adviser of the Regent. He founded in 1766 the weekly *Die Osnabrückischen Intelligenzblätter*, from which he republished *Patriotische Phantasien* (in 4 vols., 1774-76), a series of brilliant and valuable essays. His *Osnabrückische Geschichte* (1768, 3d ed., 1819) is an anticipation of the best results of the modern German historical methods. His collected works, edited by Abeken (Berlin, 1842-44), include a biography by Nicolai and Moser's poetry. Consult: Kreyssig, *Justus Moser* (Berlin, 1857); *Allgemeine deutsche Biographie*, vol. xvii (Leipzig, 1885); Rupprecht, *J. Mosers soziale und volkswirtschaftliche Anschauungen* (Stuttgart, 1892). K. Mollenbauer, *Mosers Anteil an der Wiederbelebung des deutschen Geistes* (Brunswick, 1896).

MOSES (Heb. *Mosheh*, Aram. *Musheh*, Ar. *Musa*, Gk. *Μωσῆς*, *Mōsēs*, or *Μωϋσῆς*, *Mōsēs*). The deliverer of Israel from Egyptian bondage. Recipient of the Law, and author of the Pen-

tateuch, according to Hebrew tradition. If the name is Hebrew, it comes from the root *mashah* and means 'deliverer,' 'one who draws out', cf. *yamshenu*, 'let him deliver me' (Ps. xviii. 17). Pharaoh's daughter, who is supposed to speak Hebrew, calls the child *Mosheh*, 'because I have drawn him out of the water' (Ex. ii. 10), though it might seem that *mashuy*, 'drawn out,' 'delivered,' would have been more appropriate. It is possible that the rendering of the Greek version, *Moses*, followed by Philo, New Testament writers, and Josephus, represents an attempt to find an Egyptian etymology, and Josephus suggests a derivation from *mou*, 'water,' and *ses*, 'taken'; but the order and the construction in Egyptian would be different. More recently it has been conjectured that *Mosheh* corresponds to an Egyptian '*mes*' or '*möse*,' meaning 'child,' 'offspring'; but the sibilant is different, as is also the length of the first vowel. There seems to be no adequate reason for abandoning the Hebrew etymology.

The leading events in the life of Moses, as set forth in Exodus-Deuteronomy, are the following. He was born in Goshen (q.v.) at a time when an Egyptian king whose name is not mentioned was oppressing the Hebrews, forcing them to hard labor in the building of the cities Pithom (q.v.) and Ramses, ordering their two midwives, Shiphrah and Puah, to slay all male infants, and, when they disobeyed, commanding the Egyptians to kill the children. His father was Amram, a grandson of Levi, who had come with Jacob into Goshen 430 years before the Exodus, and his mother was Amram's aunt (*dodah*), Levi's daughter, Jochebed (Yah is glory). The date of his birth is not given, but, according to the chronological system adopted in the Old Testament, it occurred 990 years before the destruction of the temple by Nebuchadnezzar, which took place in 586 B.C. (80 years to the Exodus, 480 from the Exodus to the building of the temple, 430 the duration of Solomon's temple); consequently in 1576 B.C. To save her child from the massacre, Jochebed put the infant in an ark of bulrushes, i.e., a papyrus box, and set it out in the river. Rescued by the daughter of Pharaoh, Moses was brought up as her own child. When he was grown up, he murdered an Egyptian who had killed one of the Hebrews and fled to Midian, where he married Zipporah, the daughter of a priest Jethro (or Reuel), whose flocks he tended until he was 80 years of age. Then the god of his fathers appeared to him in a bush that was burning without being consumed, commanded him to go to Egypt to deliver his people, attested his mission by giving miraculous power to his rod and his arm, and hinted at His divine name without making it fully known. Later He revealed to Moses His real name, Yahwe (see JEHOVAH), by which He had not been known to his fathers and evidently not to his father-in-law either, and on account of his infirmity of speech gave him Aaron (q.v.) as his prophet, while he himself was to be a god to Pharaoh. Moses then started for Egypt with his wife and his son Gershom (q.v.). On the way Yahwe met him and sought to kill him, but was pacified when Zipporah circumcised her son and cast the foreskin at His feet.

In Egypt Moses demanded of Pharaoh that he let his people go into the wilderness to celebrate a festival to Yahwe. But in spite of the miracles he wrought, which were in part successfully

imitated by the Egyptian magicians, Pharaoh's heart was hardened, and he would not accede to the request. Moses therefore performed with his rod or his outstretched arm a series of miracles, including the change of the water in the river into blood, plagues of frogs, lice, flies (probably a duplicate of the lice), murrain, boils (probably a duplicate of the murrain), hail, locusts, and darkness, and culminating in the slaying of the first-born of man and beast. None of these blows affected the Hebrews in Goshen. (See PLAQUES OF EGYPT; PASSOVER.) Pharaoh at last yielded, and Moses led the people, consisting of 600,000 armed men, besides women, children, and a mixed multitude joining them, by way of Succoth (q.v.), Etham, and Pi-hahiroth to the Sea of Sedges, probably a branch of the Red Sea (q.v.). Pursued by the Egyptian army, the Hebrews seemed to be caught in a cul de sac; but Moses stretched out his arm over the sea, and Yahwe made the sea dry land, the waters standing up as a wall on the right and the left, while the people crossed over. The Egyptians were drowned by the returning waters. Having thus delivered his people, he led them by way of Shur, Marah, and Elim to the wilderness of Sin, providing them miraculously with quail and manna (q.v.) to eat and water from the rock which he struck with his rod. At Rephidim (q.v.), Amalek (q.v.) was defeated. As Moses and the people approached Sinai, they met Jethro, who had with him Zipporah and her sons, Gershom and Eliezer. Jethro rejoiced with Moses over the deliverance that had been wrought and offered sacrifices to God.

From the top of Mount Sinai, Yahwe spoke to Israel amidst lightning, thunder, and smoke. As the people could not endure this, Moses went up into the mountain and was alone with Yahwe 40 days and 40 nights, receiving the tablets of stone on which Yahwe wrote the Ten Commandments (see DECALOGUE), as well as many other laws, and directions as to the construction of the tabernacle (q.v.). Meanwhile Aaron made a golden calf (q.v.), which the people worshiped. When Moses descended from the mountain and saw this, his indignation was such that he broke the tablets of stone, but he afterward interceded for the people, who were spared after 3000 had been slain by the Levites. Moses then went up again into the mountain, where he spent 40 days and 40 nights with Yahwe, neither eating bread nor drinking water during this time. As he descended with new tablets on which he had written the Ten Commandments his skin emitted rays, so that he must henceforth put on a veil when he spoke to Israel. While Yahwe did not allow him to see His face, He graciously permitted him to see His back. The tabernacle was constructed by Bezalel, a sacrificial code was given, Aaron and his sons were installed in the priesthood, dietary laws and a holiness code were promulgated, a census of the holy people was taken, and Moses led the people from Mount Sinai towards the promised land. On the way Eldad and Medad prophesied, and Moses refused to censure them for it. At Hazeroth, Miriam and Aaron opposed Moses because of the Cushite woman whom he had married. Miriam was therefore stricken with leprosy, but recovered when Moses interceded on her behalf.

Israel then settled at Kadesh Barnea (q.v.). From there Moses sent forth spies, whose re-

ports discouraged the people. A rebellion started by the Levite Korah and the Reubenites Dathan, Abiram, and On was severely punished; the earth opened itself and swallowed up these men, with their families and their supporters, 250 men were consumed by a fire that went out from Yahwe, and on the following day 14,700 were stricken by a plague because they murmured. When the people requested Moses to give them water, he did indeed strike the rock and produce water, but acted so proudly and failed so completely to glorify Yahwe in the matter that he was severely rebuked for it. Miriam died and was buried at Kadesh Barnea, and Aaron died at Mount Hor, or at Moserah. Since Edom refused to let the people pass through its land, it was necessary to go around by the Sea of Sedges, clearly the Gulf of Akabah (q.v.), in order to invade the land of Moab, then largely in the hands of Sihon, King of Heshbon. On the way the people suffered from the bites of serpents, until Moses set up a brazen serpent (q.v.), which brought healing to those who looked up to it. The Arnon was crossed, Beer was captured, Sihon was conquered, and Heshbon fell into the hands of Israel, as well as somewhat later the Kingdom of Og in Bashan. Nothing could check the progress of Moses and his people. Balaam (q.v.), who was called by Balak to curse, was obliged to bless Israel, and the Midianites who seduced Israel to worship Baal Peor were utterly routed. In the land of Moab, Moses gave his farewell address, proclaimed some additional laws, saw the promised land of Canaan from the top of Pisgah, was buried in the valley at the foot of Mount Nebo by Yahwe Himself, so that no man knew his grave, and was mourned by Israel 30 days. As he reached the age of 120 years, his death, according to the biblical chronology, occurred c 1456 B.C.

Further details are added in later writings. Thus, the name of the Egyptian Princess is given as Meris by Artapanus (in Eusebius, *Præp. Ev.*, ix, 27), who says that she was the childless wife of Chenephres, King of Upper Egypt, and also declares that Moses invented the alphabet, the various arts and sciences, philosophy, and certain forms of Egyptian worship, and won great victories as a military commander in Ethiopia. Josephus (*Ant.*, ii, ix, 2 ff.) gives the name of his foster mother as Thermutis and that of the Cushite wife as Therbis, the daughter of the Ethiopian King. Two of the Egyptian magicians who withstood Moses are mentioned in 2 Tim. iii 8 as Jannes and Jambres (q.v.), and his acquaintance with all the wisdom of the Egyptians is recorded in Acts vi. 22. According to Paul (Gal. iii. 19), the Law was given by the hand of angels. Josephus declares in reference to his end that "a cloud suddenly stood over him, and he disappeared, though he wrote in Scripture that he died, which was done from fear lest people might say that because of his extraordinary virtue he had been turned into a divinity" (*Ant.*, iv, viii, 48). According to Jude (vs 9), the archangel Michael disputed with the devil about the body of Moses; this statement was regarded by Clement of Alexandria, Origen, and Didymus as a quotation from *The Assumption of Moses*. Our Latin text of this work calls him "the great angel" (cf. Ecclus. xlv. 2: "he made him glorious as a god") and announced that "all the world is his sepulchre" (xi. 8).

The conception of his translation into heaven seems to underlie his appearance with Elijah in Matt. xvii. 3 ff., and possibly also the description of the two witnesses in Rev. xi. 6. Numerous episodes in his career are described in rabbinical literature.

Besides the Pentateuch, many other works are ascribed to Moses, such as Psalm xc, the Book of Job (so *Baba bathra*, 15 a), the Book of Jubilees (see APOCALYPTIC LITERATURE), the Assumption of Moses (see APOCRYPHA), the Testament of Moses, probably preserved in the part of the Assumption of Moses now extant in a Latin version, and the Sacred Apocryphal Book of Moses called the Eighth or Holy Book, preserved in a Leyden papyrus. It has also been maintained in the Jewish synagogue that part of the revelation of God to Moses was not written down by him, but handed to posterity by way of tradition, and that this "oral law from Sinai," having been faithfully transmitted, was committed to writing in Mishna and Talmud (qq.v.). In regard to most of these works scholars are practically agreed to-day in rejecting their claims to Mosaic authorship. Concerning the Pentateuch there is no absolute consensus of opinion. Though the Roman Catholic church has officially affirmed the essential Mosaic authorship of the Pentateuch, it may be held, and is maintained, by many eminent Catholic scholars that there is not only pre-Mosaic, but also post-Mosaic, material in this work. Not a few Protestant and Jewish scholars believe that there are certain sections that were actually written by Moses, and there is an inclination on the part of some of these scholars to assume that Moses wrote on clay tablets in the Babylonian language and the cuneiform script, known at the Egyptian court in the fifteenth century, as the Tel el Amarna letters show, and that his accounts were some centuries later translated into Hebrew and copied in the North Semitic alphabet. A very large number of investigators, however, find this improbable and reject wholly the Mosaic authorship of the Pentateuch. The vast majority of these scholars, as well as some belonging to the former class, believe that the work is made up of four literary strata, consisting of documents, designated as Yahwistic, Elohist, Deuteronomic, and Priestly, and conceived of as gradually expanding in successive editions until they were united in the work we now possess. The difference of the divine names in the Masoretic text, to which Astruc called attention in 1753, is still largely, though by no means exclusively, used as a criterion in separating these documents. According to a very generally held view, the Yahwistic document was originally written c 850 B.C. and expanded c. 750, the Elohist in its earliest form c. 750 and in a later edition c. 650, Deuteronomy in 620, and the Priests' Code after the exile, possibly not before Ezra (q.v.).

Assuming the correctness of the analysis and the tentative dates, the earliest biography of Moses, not yet containing the infancy story, the distinct Egyptian coloring of the plagues, and the emphasis on the miraculous, would have been written about 600 years after the traditional date of his death. The attempt to place the Exodus in the time of Mer-en-Ptah (1244-1232 B.C.), abandoning the biblical chronology, which might be supposed to be artificial, promised for a while a reduction of the distance to 300 years; but the discovery of an inscription

by this King representing Israel as settled in Canaan and suffering from an invasion of Palestine, which seems to have occurred in the reign of Ramses II (1310-1244), and the light thrown upon the advance of the Hebrews already in the Amarna period, have tended to render this late date wholly improbable. (See *Jews*.) In spite of the absence of any written sources, the silence concerning Moses in early prophetic oracles, and the contrast between the Mosaic laws and the practice of even pious Yahwe worshipers, many students have leaned upon the assumed oral tradition and endeavored to present on the basis of it a picture of the life and work of Moses. Scholars like Gressmann and Gunkel have recently urged as arguments in favor of the historical character of Moses the Song of Miriam, the still-remembered volcanic nature of Sinai, the pillar of fire and cloud which seems to them likewise to betray the memory of the volcanic character of Sinai, the knowledge of the fact that Israel was not indigenous in Palestine, the references to Ramses and Pithom, the Egyptian names of Moses and Phinehas, the friendly relations to the Midianites, the struggles with Amalek, the conquests of the Amorites in the East Jordan country, and the difficulty of accounting for the union of Israel and the close relation between Yahwe and Israel without such a founder as Moses may be supposed to have been.

Against the validity of these arguments various objections have been raised, especially by Cheyne, Winckler, Eduard Meyer, and N. Schmidt. The Song of Miriam seems to be only a repetition of the first two lines of the Song of Moses, which is generally regarded as late. Even if the volcanic nature of Sinai were more unmistakably indicated than it is, the knowledge of its character would not be strange, seeing that pilgrimages were apparently made to it even in the time of Elijah. As the pillar of fire appears long before the arrival at Sinai, it does not seem to be connected with the nature of this mountain. Living for centuries among the gradually subdued Amorites, Canaanites, and Hittites, Israel must have been conscious of being invaders, but the historic character of Moses does not appear to follow from a recognition of this fact. Since the cities of Pithom and Ramses were built by Ramses II, these names point to a period much later than that which the biblical date and historic considerations alike suggest for the Hebrew invasion. There is no convincing evidence that either Moses or Phinehas is an Egyptian name. Memories of early relations with Midian and Amalek may have existed without involving the character of Moses. The Songs of the Conquest, which may be among the oldest poems in Israel, seem to mention the crossing of the Sea of Sedges as well as the Arnon, and the capture of Beer and Heshbon, but there is no reference to Moses. The historian Eduard Meyer complains that "among those who treat him [Moses] as an historical figure none has been able to give him any content, to present him as a concrete individuality, or to indicate anything he did, or wherein his historic work consisted; since to say that he made the statement that Yahwe was Israel's god is only to use an empty and meaningless phrase"; he regards Moses as the mythical ancestor of the priests of Kadesh, "a figure of the genealogical saga, connected with the cult, and not an historical personality."

(*Die Israeliten*, p. 451, Halle, 1906.) The references to Moses as a god (Ex. iv. 16, vii. 1), his face as emitting rays (or "having horns," so the Vulgate and, according to Jerome, Aquila; hence the representation of Moses by Michelangelo as horned), and his wearing a veil to hide his face, having even been interpreted as surviving signs of an originally divine figure, to which the name Deliverer would be altogether suitable.

In recent years a reaction has set in against the prevalent system of Pentateuchal analysis on the ground of the inadmissibility of the divine names as a documentary criterion, the inadequacy of other marks of distinction, the indications of a diaskeuastic activity in ways not hitherto considered, and the independence and higher age of numerous songs and sagas. Concerning this latest phase of criticism, represented by Eerdmans, Wiener, Dahse, and Schmidt, as well as the history of critical study in general of the books ascribed to Moses, and the division of the material among the currently assumed documents, see *PENTATEUCH*. The more searching textual and historical criticism now demanded may incidentally produce great uncertainty as to stratum of tradition and relative date where for some time everything has seemed to be definitively settled, and impose suspense of judgment, but it is by no means impossible that it may ultimately lead not only to a more correct view of the growth of a wonderful literature, but also to an actual increase of knowledge and a more accurate appreciation of the figure of Moses.

There is as yet no external evidence of any kind that is of real importance. The number of Greek and Roman historians who mention Moses and the expulsion of the Jews from Egypt is indeed considerable. Among them are Hecataeus of Abdera, Manetho, Posidonius, Lysimachus, Chæremon, Trogus, Strabo, Diodorus, Tacitus, and Plutarch, but even their combined testimony has little weight. The later writers depend on the earlier, and some of these may easily have picked their crumbs of learning in the Jewish ghetto at Alexandria. Hecataeus and Manetho are the most important. It cannot be said to be impossible that the former was told by Jews that their fathers were driven out of Egypt because the gods were angry with them, and that the common mass of the expelled became their ancestors, while the flower of the people went to Hellas (fragment in Diodorus, xl. 3); but nothing of historic importance can be extracted from it. Manetho evidently identified the Hebrews with the Hyksos, and some personality called Osarsiph of the Hyksos period with Moses. Whether he found this name in his story, which is genuinely Egyptian and may have been of considerable age, we have no means of knowing. In itself it is not at all improbable that Habiri-Hebrews came into Goshen while the Hyksos occupied Egypt, and that they were driven out of their dwelling places in consequence of the expulsion of the Hyksos. (See *Jews*.) But Manetho's statement is too late and comes to us through channels that are too dubious to inspire confidence.

Bibliography. Consult the histories of Ewald, Renan, Stade, Kittel (2d ed., Göttingen, 1909-12), Guthe, Buhl, Köhler, Winckler, Piepenbring, Kent, Klostermann, Wellhausen (7th ed., Berlin, 1914), also the commentaries on Exodus, Leviticus, Numbers, and Deuteronomy enumerated in the articles on these books; the biblical

theologies by Schultz, Dillmann, Stade, Smend, Marti, and others; the introductions to the Hexateuch by Kuenen, Wellhausen, Westphal, Holzinger, and Carpenter-Battersby; the general introductions to the Old Testament by Cornely, Kaulen, Baudissin, Cornill, Driver, Sellin, and others; Nathaniel Schmidt, "The External Evidence of the Exodus," in *Hebraica* (Chicago, 1894), Karl Budde, *Religion of Israel to the Exile* (New York, 1899); S. R. Driver, in *Authority and Archaeology* (London, 1899), T. K. Cheyne, "Moses," in *Encyclopædia Biblica* (ib., 1902); Wilhelm Spiegelberg, *Aufenthalt Israels in Aegypten* (Leipzig, 1904), Eduard Meyer, *Die Israeliten und ihre Nachbarstämme* (Halle, 1906); Paul Volz, *Moses* (Berlin, 1907); Nathaniel Schmidt, "Jerahmeel and the Negeb," in *The Hibbert Journal* (London, 1908); Eerdman, *Alttestamentliche Studien*, vol. II (Gießen, 1910); C. F. Lehmann-Haupt, *Israel* (Berlin, 1911), Hugo Gressmann, *Moses* (ib., 1913); J. F. H. Gunkel, "Moses," in *Die Religion in Geschichte und Gegenwart* (Tübingen, 1913). For the mass of legends that gathered around Moses, see Gustav Weil, *Biblische Legenden der Muselmänner* (Frankfurt, 1845), Beer, "Das Leben Moses nach Auffassung der jüdischen Sage," in *Jahrbuch für die Geschichte der Juden und des Judenthums*, vol. II (Leipzig, 1863); Lauterbach and Kohler, "Moses," in *The Jewish Encyclopædia* (New York, 1905).

MOSES. A colossal statue in the church of San Pietro in Vincoli, Rome, one of the most famous works of Michelangelo. The gigantic figure is seated in the attitude of one about to spring to his feet. The left hand is pressed to the body to restrain his indignation at the worship of the golden calf, at which he appears to gaze with flashing eyes and frowning face, while the right hand grasps the tables of the law. The head shows two short horns, based on a mistaken interpretation of Ex xxxiv 21. The "Moses" was one of 30 proposed statues for the tomb of Pope Julius II in St. Peter's, which was not completed. See Plate under MICHELANGELO.

MOSES, ASSUMPTION OF, and REVELATION OF. See APOCRYPHA, *Old Testament*, also ASSUMPTION OF MOSES.

MOSES, BELLE (?-). An American author. She was born at Savannah, Ga., graduated from Home College at Montgomery, Ala.; and became a contributor to newspapers and magazines. She is author of *Louisa M. Alcott, Dreamer and Worker* (1909), *Lewis Carroll in Wonderland and at Home* (1910), *Charles Dickens and his Gul Heroines* (1911), *Helen Ormsby* (1912).

MOSES, BERNARD (1846-). An American writer on political science, born at Burlington, Conn. He graduated at the University of Michigan in 1870, studied at Heidelberg (Ph.D., 1873), and was professor of history at Albion College in 1875. In 1876 he was appointed professor of history and political science at the University of California. He served as a member of the United States Philippine Commission in 1900-02. He is author of *Politics* (1884), with W. W. Crane, *The Federal Government in Switzerland* (1889), *The Railway Revolution in Mexico* (1896), *Democracy and Social Growth in America* (1898), *The Establishment of Spanish Rule in America* (1898), *Government of the United States* (1906), *South America on the Eve of Emancipation* (1908), *Spanish Dependencies in South America* (1915).

MOSES, MONTROSE JONAS (1878-). American author, born in New York, where he graduated from the City College in 1899. He early took up editorial and literary work, the drama and literature for children being his special interests. Between 1900 and 1910 he was connected editorially with, or was a contributor to, various periodicals: the *Literary Digest*, the *Reader*, the *Independent*, the *Book News Monthly*. Besides editing the *Green Room Book* and the *Anglo-American Dramatic Register* and making some translations from the French, he wrote *Famous Actor Families in America* (1906), *Children's Books and Reading* (1907); *Henrik Ibsen* (1908); *The Literature of the South* (1909), *The American Dramatist* (1911); *Maurice Maeterlinck: A Study* (1911).

MOSES BEN MAIMON BEN JOSEPH. See MAIMONIDES.

MOSES OF CHORENE, kô-râ'nê. An Armenian author of the fifth century. Of the works ascribed to him the most important are *A History or Genealogical Account of Armenia Major* (to 442 A.D.), a small *Geography of Armenia*, and a *Rhetoric*. Their authorship, however, is uncertain, most critics assigning the *Geography* to the seventh century, while the *History* is by some (Gutschmid, Khalatiants, Carrière) held to be a work of the seventh or eighth century and by others (Gutschmid at one time, Baumgarten, Conybeare) to have originated in the fifth century, being largely interpolated in later ages. The style of the *Rhetoric* differs from that of the other two works, and Conybeare thinks it is a genuine work of Moses of Chorene. From the *History* it appears that the author was born at Khornî, in the Tarom district, and was a pupil of the Patriarch Sahak the Great and of Mesrob, the inventor of the Armenian alphabet. After 431 he was sent by them to Alexandria to study Greek literature and visited Palestine, Italy, Athens, and Constantinople. He later became Archbishop of Pakrevant and died about 492 A.D. Later tradition added to his fame, and numerous works came to be ascribed to him. The *History*, which at one time stood high in the opinion of critics, is now little trusted. It is important for the light it throws on the religious history and folklore of early Armenia. It was published, along with the *Geography*, at Venice (1843, 1865) and, with Latin translation, by the brothers Whiston (London, 1736). The *History* has been translated into French by De Florival (Venice, 1841) and Langlois (Paris, 1869), German by Lauer (1869), Italian by the Mechitarist Brothers at Venice (1841), and Russian by Emin (Moscow, 1858). The *Geography* is available in French (trans. by Vivien Saint-Martin, 1818, and Soukry, 1881), the best edition, however, is that of Patkanov (St. Petersburg, 1877, with Russian translation). Consult: Khalatiants, *Armenskie Epos Moiseva Khorenskago* (Moscow, 1869); Von Gutschmid, *Ueber die Glaubwürdigkeit der armenischen Geschichte des Moses von Khoren* (Leipzig, 1876); Carrière, *Moïse de Khoren* (Paris, 1891), id., *Nouvelles sources de Moïse de Khoren* (Vienna, 1893; supp., 1894); the articles of F. C. Conybeare, in *Byzantinische Zeitschrift*, vols. x, xi (Leipzig, 1901-02); the works enumerated by Chevalier, *Répertoire des sources historiques du moyen-âge*; *Bio-Bibliographie*, vol. II, col. 3271 et seq. (Paris, 1907).

MOSETENAN, mō'sā-tā'nān. The language

of the Indians of northwestern Bolivia, South America, living on the Río Beni and its tributaries, between the fourteenth and sixteenth parallels of south latitude. Consult: N. Armentia, *Los Indios Mosetenes y su lengua* (Buenos Aires, 1903), and A. F. Chamberlain, in *Journal de la Société des Américanistes de Paris*, vol. vii (N. S., Paris, 1910).

MOSGU, mós'koo, or **MUSGU**. Pagan negroes in the Chad basin, Sudan, south of the lake, between the Shari and Logone rivers. Their number is estimated at 35,000. Together with the Logonese and other tribes, related to them but politically independent, they form the Masa family. Their habitations are highly distinctive conical clay structures studded at regular intervals with curious protuberances which enable the natives to climb to the top. The Mosgu are both fishermen and cultivators of the soil; their agricultural implement is the hoe, and they are acquainted with the use of manure. The women are deformed by immense wooden disks inserted into both lips. Unlike neighboring Mohammedan peoples, the Mosgu have a rather imperfect political organization: each individual is more or less independent of his neighbors, and the chiefs have little influence. Thus they have fallen prey to the slave raiders from Bornu. Consult: Henry Barth, *Travels and Discoveries in North and Central Africa*, vol. iii (New York, 1857). H. K. W. Kumm, *From Hausaland to Egypt* (London, 1910); Mohn, "Das deutsche Tschadseegebiet, Land und Leute," in *Jahrbuch des städtischen Museums für Völkerkunde zu Leipzig* (Leipzig, 1911); Adolf Friedrich, Herzog zu Mecklenburg, *Vom Kongo zum Niger und Nil* (ib., 1912).

MOSHEIM, mós'hím, JOHANN LORENZ VON (1694-1755). A distinguished German Church historian and theologian. He was born at Lübeck, Oct. 9, 1694, and studied at Kiel. In 1723 he became ordinary professor of theology at Helmstedt and in 1747 at Göttingen, where he died as chancellor of the university, Sept. 9, 1755. His theological works are numerous, among them a work on Bible morality, *Sittenlehre der heiligen Schrift* (1735-53; 4th ed., 1753-61; continued by J. P. Miller, 1770-78), and discourses, *Heilige Reden* (1732; 4th ed., 1765). But his contributions to theological literature in the department of ecclesiastical history are most important, by reason of their great learning, fullness, and accuracy. The following have been translated from the original Latin: *Christian Church in China* (London, 1862). *Commentaries on the Affairs of Christians before the Time of Constantine the Great* (ib., 1813-15). *Institutes of Ecclesiastical History* (Murdock's trans., ed. by W. Stubbs, 1862; new ed., Boston, 1892); his valuable *Versuch einer unparteiischen Ketzergeschichte* (1746-48) is untranslated.

MOSHER, mö'zhër, HARRIS PEYTON (1867-). An American laryngologist, born at Woodfords, Me. He received his education at Harvard University (A. B., 1892; M. D., 1896). Opening an office in Boston, he became connected with several hospitals. He joined the staff of his alma mater as instructor in anatomy and was later appointed professor of laryngology. At Harvard he founded a museum illustrating the normal anatomy of the nose and throat and accessory sinuses and their variations. He also conducted annually a graduate

course on these subjects. Mosher became successful as an operator and devised the exenteration of the ethmoidal labyrinth, the approach to the cavernous sinus by the orbital route; an intranasal operation for drainage of the lachrymal sac and the tear duct, etc. He also originated instruments for direct intubation, an adjustable speculum for direct inspection of the larynx, a spiral wire papilloma extractor, a ballooning œsophagoscope, a tube for closing safety pins in the trachea or œsophagus. Mosher contributed numerous articles to professional journals.

MOSKVA, mós'kvá'. A river of European Russia, a left affluent of the Oka, which is itself an affluent of the Volga. It rises in the Government of Smolensk, flows eastward through the city of Moscow, and joins the Oka near Kolomna, in the Government of Moscow, after a course of 285 miles. It is navigable for small vessels between Moscow and the Oka, a distance of 112 miles, and is an important commercial route. On its banks, Sept. 7, 1812, occurred the famous battle of the Moskva or Borodino between the Russians and Napoleon.

MOSKVA, PRINCE OF THE. See NEY, MICHEL.
MOSLEM, möz'lēm, or **MUSLIM**, mütz'lim. A common designation in the West for a Mohammedan. It comes from the Arabic *muslim*, a derivative of *salima*, 'to be safe,' which is often used by Mohammed in the sense of 'self-resigned,' 'submissive,' 'a follower of Islam,' generally in contrast to *kāfir*, an unbeliever, infidel. The name Mussulman, often used in the same sense, is derived from the Persian plural of *muslim* (*muslimān*). See ISLAM, MOHAMMEDANISM.

MOSLEM ART. See MOHAMMEDAN ART.

MOSLER, möz'lër, HENRY (1841-). An American genre painter, born in New York City. He studied in Cincinnati under J. H. Beard, in Paris under Hébert, at the Munich Academy under Wagner, and in Düsseldorf. He became especially well known in Paris, where he lived many years and exhibited much. Though appealing to popular taste, his work is frequently deficient in draftsmanship and color. He won various awards, including gold medals at the International Exposition at Nice (1884), at Atlanta (1895), and at Charleston (1902), and the cross of the Legion of Honor. His more notable works include: "The Return" (1879), the first painting by an American to be bought by the French government for the Luxembourg. "Wedding Feast in Brittany" (Metropolitan Museum, New York). "Saying Grace" (Corcoran Gallery, Washington). "Rainy Day" (Pennsylvania Academy); "Wedding Morning" (Sydney Museum, Australia).

MOSQUE, mösk (Fr. *mosquée*, from Sp. *mezquita*, from Ar. *masjud*, temple, from *sajada*, to prostrate one's self, to pray). A Mohammedan house of prayer and worship. Examples of these buildings are found wherever the Mohammedan faith has prevailed, from Spain to India and Turkestan. There is no fixed form of structure for them, in poor communities a bare room provided with a *mihrāb* (prayer niche) to mark the *kiblah* (q. v.) often serves the purpose. In general the earliest type of mosque was an open court, surrounded on three sides by an arcaded portico, of a single or rarely a double row of arches on columns or piers, and having at the side of the court towards Mecca the open prayer hall composed of similar arcades, with more

rows of supports; it contains the *mihrab* and to the right of it the *minbar* (pulpit), and, in front, generally a platform and reading desk. In the open court (*sahn*) is the fountain for ablutions, an indispensable feature of every mosque inclosure, often of large size and covered with a dome. This is the typical mosque plan until the fourteenth century. All the early mosques of Cairo and the great mosques of Kairwan, Mecca, Medina, Damascus, etc., were of this type.

The mosques of India and Central Asia are also generally constructed after this plan. The Mohammedans, however, have always been influenced by the native forms of architecture in the different countries which they have entered. The Spanish mosques, e.g., closely resembled churches, having many parallel aisles supported on a forest of columns like the old Cordova mosque, or fewer aisles, like the mosque at Toledo, now San Cristo de la Luz. The dome was not used to any extent till the thirteenth century, when the new type of the mausoleum mosque, derived perhaps from Persian domical tombs, made its appearance. Already as early as 1201 the dome had appeared in the Bibars and Imam Shaffei mosques at Cairo. But the masterpiece of the type is the Hasan mosque at Cairo (1356), followed by those of Barkuk, Khawand al Baraka, and others. In the fifteenth century appeared the second or Turkish type, based on Hagia Sophia (see Plate of St SOPHIA), of which there are several superb examples at Constantinople (Mehmet II, Suleiman, Ahmet, and others): at Adrianople (of Selim I), an earlier one at Isnik, and the model spread even to Egypt, as in the Sinan mosque at Bulak. Still another type of dome appeared in certain mosques of India of the Mogul period (after 1496), based on Persian models, as in the Jumma Masjid at Delhi, the Muti Masjid at Agra, and the stupendous mosque at Bijapur. Among the most famous and sacred of the early mosques were the Masjid al Harim at Mecca (q.v.), the Masjid al Nabi at Medina (q.v.), the Masjid al Aksa, the Mosque of Omar at Jerusalem (see Plate of JERUSALEM), and the great Mosque of Walid at Damascus. All of these have been rebuilt, so that their early form is no longer recognizable. The old mosque at Kairwan (q.v.) is a well-preserved early example (eighth century), as is also the Mosque of Tulun at Cairo; the Mosque of Amru at Cairo is of even earlier foundation, and still retains portions of old work. The Mosque of Omar represents the concentric mausoleum type. It is now two or three centuries since mosques of any architectural importance have been erected. The poorer mosques have bare whitewashed walls with no decoration of any kind. The larger and more pretentious are often elaborately and artistically decorated with carvings, arabesques, and passages from the Koran in the most involved style of ornamental calligraphy. Hundreds of oil lamps and sometimes ostrich eggs, elephants' tusks, and the like hang from the ceiling. The floor is usually covered with matting. A striking feature of mosque architecture is the minaret (q.v.).

The five prayers are said in the mosque daily. (See MOHAMMEDANISM.) The worshiper before entering performs the necessary ablutions, removes his shoes, carries them in his left hand, sole to sole, puts his right foot first over the

threshold, and takes his place in the congregation facing the *mihrab*. The attendance is more general on Friday, when some special prayers are said and a sermon (*khutbah*) is often added. A mosque which has this service is called *masjid al jami'* (mosque of the general assembling) or simply *jami'*. The *khutbah*, as well as religious proclamations, is generally pronounced on or from the *minbar*, a narrow and lofty pulpit, with a steeple-like cap, it stands at the right of the *mihrab* and is reached by a steep flight of steps. Women are not forbidden to enter the mosque, but their presence is not considered seemly during the time of prayer, sometimes a special place, secluded by a screen, is provided for them. There are few mosques to which unbelievers do not now have access. The utmost decorum and solemnity are observed during services, and the mosques are deeply revered by the faithful, yet when services are not going on they serve as general gathering and lounging places and as resting places for travelers and wanderers. It has been the custom from the beginning for teachers and professors to give lectures and hold classes in the larger mosques, which thus serve as college buildings. The teacher takes his place at a pier or column at stated hours, his favorite pupil holds his books or notes, and the audience sit around on mats. Several such courses are carried on simultaneously in different parts of the covered arcades. Until *madrassahs* (see MADRASAH) were built in the eleventh century, the mosques were probably the only regular seats of advanced teaching. In recent times the advanced education in the mosques has been largely confined to the preparation of candidates for the position of imam, but there are still notable exceptions. The Azhar mosque in Cairo, the only survivor of many fine mediæval institutions, has long been the main centre of advanced instruction in Mohammedan countries, and its courses are attended by between 5000 and 10,000 students. Minor buildings, such as schoolrooms, academies, libraries, hospitals, dormitories, public kitchens, and almshouses, are often connected with the mosques. Attached to the Imperial mosques at Constantinople and at Brusa are also *turbeh*, or mausoleums of sultans, some of them (e.g., that of Soliman) are of great magnificence.

The revenues of the mosques are derived not only from the contributions of the faithful, but also from investments in landed property (*ukūf*), often from gifts made centuries ago, this property is in the hands of trustees. The income serves to keep the buildings in repair and to pay necessary expenses. The mosque officials and attendants include the imam, who leads the prayers, the learned men, who teach (*maulawi*, *ulamā*); the *khatib*, or preacher (in a *jami'*), the *muezzins* (see MUEZZIN), who call to prayers, doorkeepers, lamp-lighters, etc. Their number depends entirely upon the revenues, sometimes a single imam combines in his person the functions of all the others. The imam has a salary from the revenues, but the teachers are dependent entirely upon the gifts of their pupils. See MOHAMMEDANISM. Consult: Marcel Dieulafoy, *L'Eglise et la mosquée* (Paris, 1909); S. H. Leeder, *Veiled Mysteries of Egypt and the Religion of Islam* (London, 1912); G. L. Bell, *Palace and Mosque at Ukhaider* (Oxford, 1914). Cf. MOHAMMEDAN ART, *Bibliography*.

MOSQUERA, mós-ká-rá, TOMÁS CIPRIANO DE (1798-1878) A Colombian soldier, statesman,

and scientist, born in Popayán. He served with distinction in the wars of independence; at 31 was a general; was sent as Ambassador Extraordinary to Peru; and in 1833 was made Senator. As President from 1845 to 1849 he promoted the country's development, fostered science and education, encouraged public improvements, and maintained the credit and finances of the nation on a sound basis. A tolerant conservative, he became the leader of the Liberal party and headed a successful revolt against the government in 1859. He assumed the dictatorship in 1861 and called a congress which formed a new federal constitution. Mosquera was then reelected President and continued the policy of his earlier administration. He was deposed and banished in 1867 for arrogating to himself the power of adjourning Congress. He returned to Colombia two years later and became Governor of Cauca and a Congressman. His writings include *Memorias sobre la vida del libertador Simón Bolívar* (1853); *Memoir on the Political and Physical Geography of New Granada* (1853); *Compendio de geografía de Colombia* (1866).

MOSQUE (mōsk) SWALLOW. One of a group of related Asiatic and North African swallows within the genus *Hirundo*, whose prevailing colors are blue, with chestnut on the rump and side of the head and buff or brownish streaked breasts. They are familiar town swallows wherever they occur, and take their English name from the habit of placing their nests commonly on the walls and minarets of mosques. These nests and their eggs are much like those of the American caves swallow. The commonest Oriental species are *Hirundo daurica* and *Hirundo nepalensis*, and a conspicuous African one of large size is *Hirundo senegalensis*. Consult Sharpe and Wyatt, *Monograph of the Hirundinæ* (London, 1885-94), and authorities upon East Indian birds cited under BIRD.

MOSQUITÍA, mōs'kê-tē'ā. A strip of territory on the east coast of Central America. See MOSQUITO COAST.

MOSQUITO, mos-kē'tō (Sp., Portug. *mosquito*, dim. of *mosca*, fly, from Lat. *musca*, fly). A biting fly of the family Culicidæ. These flies belong to the group of nematocerous Diptera, and their nearest allies are the crane flies, the midges of the families Dixidæ, Stenoxenidæ, and Chironomidæ, the fungus gnats, gall gnats, and moth flies, from all of which true mosquitoes are distinguished by the fact that the veins of the wing and the body itself bear flattened scales, readily perceived under a low power of the microscope. The family is a large one and the number of described species has doubled

A FEMALE MOSQUITO (*Culex*).

within the last few years, since especial attention has begun to be paid to this group, and activity in research is now so great that it is probable that the number of species may again be doubled before the mosquito fauna of the globe is fairly well known.

Geographic Distribution. The mosquitoes form a cosmopolitan group and extend practically to all known portions of the globe. Certain species are excessively abundant in the Arctic regions, while the greatest number of species is to be found in the tropical and subtropical life zones. Certain of the genera are very widely distributed, the typical genus, *Culex*, being found practically everywhere. *Anopheles* is represented in all regions except the Boreal and the Arctic, *Stegomyia* occurs in southern Europe, North, South, and Central America, West Indies, Africa, India, Malay Archipelago, eastern Asia, and Australasia. A similar distribution is found with others of the less conspicuous genera. Certain species are also of almost world-wide distribution, and this is doubtless largely due to the ease and frequency with which mosquitoes are transported

MOSQUITO OF MALARIA (*Anopheles maculipennis*)

by seagoing vessels and by railway trains, and to the extraordinary facility with which they accommodate themselves to a novel environment. It is a well-substantiated fact, e.g., that there were no mosquitoes in the Hawaiian Islands until they were brought there by sailing vessels. Certain species have a remarkable range through different life zones, and the group as a whole has only a slight faunistic value. For example, *Culex pygmaeus*, the "rain-barrel" mosquito, occurs throughout Europe from Scandinavia to Malta, all over North and Central America and the West Indies, and is also found in Oriental regions.

Classification. The family has been divided by Theobald into six subfamilies: Anopheles, Megarhinus, Culex, Edeomyia, Trichoprosopon, and Corethra being the typical genera of these subfamilies. The last named, however, has a short proboscis not formed for piercing, and does not belong to the biting mosquitoes proper. The characters which have been relied upon mainly in the differentiation of the genera have been the comparative length of the palpi in the different sexes, the character of the terminal joints of the palpi, the relative proportions of certain of the cells of the wings, the characters of the scales of the legs and head, the bristles upon the metanotum, and certain other points connected with the relations of the veins of the wings. The species for the most part have been separated upon colorational characters, although certain characteristics of the wing venation are specific rather than generic, and the study of the body scales reveals specific characters. There are also some interesting characters

MOSQUITO OF YELLOW FEVER (*Aedes calopus*)

connected with the teeth of the foot claws which are both specific and generic.

Life History. Mosquitoes in their early stages are all aquatic. The larvæ need a certain amount of standing water for their development. The eggs are laid by the adult insects, in the majority of cases upon the surface of

EGG OF ANOPHELES.

a, upper surface, b, under surface. These eggs float in disconnected masses (Greatly magnified)

standing water. They may be laid upon end, attached side by side in raft-shaped masses, as in *Culex pipiens* and as in the genus *Uranotania*, or they may be laid singly on their sides, as in *Anopheles* and *Aedes*. They may also be laid upon moist earth in swampy places, as with *Aedes sollicitans*, or upon the leaves of pitcher plants, as with *Wyeomyia smithii*, hatching in these cases when water eventually reaches them. The eggs of some species, as those last named and *Aedes calopus*, will bear desiccation, but the vitality of others, as those of *Anopheles*, is destroyed when they are removed from the water for any length of time. The egg stage is short with perhaps the majority of species, but with others it is much longer, and may be the hibernating stage with certain forms. The larva is an active and voracious little creature, and is commonly known as a wiggler or wriggler. Its life as a rule is short, and with the great majority of the species it is a true air breather, coming to the surface of the water at frequent intervals and extruding its respiratory tube in order to suck air into its tracheæ. The

EGGS AND LARVÆ.

a, a raft of eggs of the common mosquito (*Culex*), b, a single larva (wiggler) taking breath at the surface, c, a larva (enlarged).

anal locomotory flaps of many species have an abundantly branched tracheal supply, and at least during part of the larval life these flaps function as air gills, rendering it possible for the larva to remain below the surface of the water for a prolonged period of time. The food of mosquito larvæ is most variable. They swallow all sorts of minute organisms which float upon the surface or are held in suspension in the water. The larvæ of *Anopheles* feed for the greater part of their life at the surface, and

consequently devour mainly the spores of algae which float there. Later in life in shallow water they descend to the bottom and feed upon heavier objects. The larvæ of *Culex* and *Aedes* feed below the surface upon small organisms, animal and vegetable, and mineral as well, which are held in suspension. The larvæ of *Psorophora* seem largely carnivorous, and, on account of their large size, are able to overpower and to devour other mosquito larvæ and other aquatic insects. They are even cannibals, and will feed upon small individuals of their own kind. All mosquito larvæ are very active, wriggling quickly through the water by abrupt and rapid bendings of the body, aided in some cases by long lateral hairs, and especially by a well-developed group of flaps at the anal end of the body. Food is brought into the mouth by the active movement of long oral cilia. In many forms the jaws are undeveloped, but in some, as in *Psorophora*, they are well formed and adapted for piercing and tearing.

The pupa is also active, but does not feed, and possesses no mouth parts. As a rule it floats at the surface of the water, breathing through two respiratory tubes which issue from the thorax—a curious change from the respiratory tube of the larva, which is single and issues from the anal end of the abdomen. Although generally floating at the surface, the pupa when disturbed rapidly vanishes below the surface by energetic movements of the abdomen and of the anal flaps, and is thus enabled to a certain extent to avoid the attacks of fish and other enemies. The pupal stage is usually of short duration, and the adult issues through the cracking of the skin of the thorax. With many mosquitoes there are several generations annually. With *Culex pipiens*, e.g., there may be from eight to twelve such generations in a long summer, but other species, probably including *Anopheles maculipennis*, have but one. With other species it seems reasonably certain that the life duration of the individual is much greater and that in some cases there may be but a single generation each year. Some mosquitoes hibernate as adults, stowing themselves away in protected places at the beginning of cold weather, others hibernate in the egg stage, and still others as larvæ, readily standing extremes of temperature, and even emerging in good condition with the warm weather of spring from blocks of ice in which they have been solidly frozen.

Agency of Mosquitoes in Carriage of Disease. Since 1898 mosquitoes have been known to be of vital importance to the human race, following the discovery that certain of them are agents in the carriage of several diseases of human beings, notably malaria and yellow fever. Malaria is carried by *Anopheles maculipennis* (also known as *A. quadrimaculatus*) and yellow fever by *Aedes calopus* (formerly known as *Stegomyia fasciata*). See INSECTS, PROPAGATION OF DISEASE BY.

Riddance of Mosquitoes. The most effective way of relieving a neighborhood of mosquitoes consists in abolishing the breeding places. All accumulations of stagnant water—and these are of the most varied and frequently inaccessible character—must be removed wherever it is possible. Swampy lands should be drained; hollows in old trees and stumps should be filled up; old cans and bottles should be removed; cess-pools should be hermetically sealed; rain-water

barrels should be covered with fine wire gauze; the roof troughs of houses should be frequently cleaned out. No possible supply of standing water should be overlooked, and this will in many cases require a most careful and ingenious search. Where mosquitoes are breeding in troughs, fountains, or similar places, fish, such as sunfish, goldfish, or top minnows (qqv), should be introduced. Where ponds exist which it is not possible to drain, the water margins should be kept clean and sharp, and superabundant vegetation should be removed and the pond stocked with fish. Moreover, if the fish supply of such ponds cannot be made satisfactory, a certain amount of kerosene placed upon the surface of the water will quickly destroy mosquito larvæ. This kerosening of swamp lands, where drainage is impossible or very expensive, is often a temporary remedy of great value. In malarial regions persons may be protected from the bite of the dangerous and annoying mosquitoes by the careful screening of houses and by wearing mosquito veils and gloves at night when obliged to be out of doors. *Anopheles*, as a rule, bites only at night. By protecting healthy persons and malarial patients as well, and by the free use of quinine with the patients, the general health of the population of the Roman Campagna has greatly improved. The Germans in East Africa made efforts to wipe out malaria by simply destroying the disease with medicine. Malaria once abolished in human beings, there will be none for the mosquitoes to carry. In the United States extensive work has been done in destroying breeding places. Under such conditions malaria will die out. In Cuba, aside from protecting the early yellow-fever patients and the constant use of mosquito bars in hospitals, yellow fever has been exterminated by house-to-house work against the breeding places of *Aedes*, this work being carried on first by the medical officers of the United States army and later by the health authorities of the Cuban government. Mosquitoes, as a rule, may be stupefied by burning pyrethrum powder (Persian insect powder). They may also be deterred from biting by anointing the skin with oil of citronella. See GORGAS, W. C.; INSECTS, PROPAGATION OF DISEASE BY; PANAMA CANAL; YELLOW FEVER.

Bibliography. L. O. Howard, *Mosquitoes* (New York, 1901); Ronald Ross, *Mosquito Brigades* (London, 1902); Theobald, *A Monograph of the Culicidae of the World* (ib., 1901-10); G. M. J. Giles, *Gnats and Mosquitoes* (New York, 1905); E. G. Mitchell, *Mosquito Life* (ib., 1907); E. H. Ross, *Reduction of Domestic Mosquitoes* (Philadelphia, 1911); Howard, Dyar, and Knab, *Mosquitoes of North and Central America and the West Indies* (4 vols., Washington, 1913).

MOSQUITO, mōs-kē'tō (corruption of the native name *Misskito*). A tribe which occupies the eastern coast of Nicaragua, known from them as the Mosquito Coast (q.v.). They are an intelligent people, short in stature and usually very dark in color. This latter trait is said to be due in part to admixture with negro blood from the slavers wrecked upon their coast. They number about 6000 souls. Tehmunn connects their language with the Sumo group. Consult C. De Kalb, "A Bibliography of the Mosquito Coast of Nicaragua," in *Journal of the American Geographical Society*, vol. xxvi, pp. 241-248 (New York, 1894), and W. Teh-

mann, "Ergebnisse einer Forschungsreise in Mittelamerika und Mexico, 1907-1909," in *Zeitschrift für Ethnologie*, vol. xlii, pp. 687-749 (Berlin, 1910).

MOSQUITO BEE. Any one of several of the very small, stingless, tropical honeybees of the genus *Melipona*, which form communities, consisting at times of countless numbers. They are among the smallest of the bees, and although they do not sting, all the essential elements of the sting are present, the pointed or penetrating part of the apparatus being stunted. One species (*Trigona*, or *Melipona, mosquito*) sends off swarms after the manner of the common hive bee. The nests abound in honey, and have many enemies, since the bees cannot defend themselves by stinging. The nests, however, are rich in devices for protection and for the exclusion of intruders. Some species of them build their nests in completely with clay. See BEE.

MOSQUITO BLIGHT. A disease of the tea plant in India and Ceylon, caused by the punctures of several of the species of the genus *Helopeltis* of the plant-bug family Capsidae. The young bugs as well as the adults feed upon the leaves and young twigs of the plant, causing them to wilt.

MOSQUITO COAST, or *Mosquitia*. The strip of territory inhabited by the Mosquito Indians on the east coast of Central America, stretching along the Caribbean Sea from about lat. 10° 30' N. to 13° N and extending about 40 miles inland (Map: Central America, F 4). It is notable chiefly for the fact that it was for a time the subject of diplomatic controversy between the United States and Great Britain. From about 1655 to 1850 it constituted a protectorate under the nominal control of Great Britain, during which time various attempts were made to plant colonies there, but only with partial success. Both the Central American republics and the United States denied the claim of Great Britain to a protectorate over the Mosquito Coast, the latter particularly on account of the contiguity of the territory to the proposed interoceanic canal which the United States wished to construct or cause to be constructed. The seizure in 1848 of Greytown (San Juan del Norte), an important commercial port at the mouth of the San Juan River, in Nicaragua, by the Mosquito Indians with the aid of England, caused great excitement in the United States, and for a time war seemed possible. To avert this danger, however, and to obtain a basis for a uniform policy of abstention from interference in the region by both England and the United States with a view to securing the neutrality of the proposed canal, the Clayton-Bulwer Treaty of 1850 was concluded between the two countries, by which it was agreed that neither party would occupy, fortify, colonize, or exercise dominion over the Mosquito Coast or any part of Central America. By a treaty of Nov. 28, 1859, with Honduras, Great Britain ceded to that Republic its claim to the protectorate hitherto exercised over the Mosquito Indians and agreed to recognize as belonging to and under the sovereignty of Honduras all territory occupied by the said Indians. This arrangement was very unsatisfactory to the Indians and led to a revolt among them. The difficulty was finally adjusted by the Treaty of Managua between Great Britain and Nicaragua of Jan. 28, 1860, by which it was stipulated that Great Britain would recognize the sovereignty of

Nicaragua over the Mosquito territory lying within its bounds; that a certain district should be assigned to the Indians, and that the British protectorate should cease within three months after the exchange of ratification. A dispute having arisen between Nicaragua and the Mosquito nation in regard to the interpretation of the treaty, the Emperor of Austria was requested to decide upon the true meaning of the clauses in dispute, which he did in 1880, holding that the sovereignty of Nicaragua over the Indians was limited by the right of self-government conceded to them by the treaty. From that time onward the natives enjoyed almost complete self-government. By an agreement entered into between Nicaragua and the Mosquito Indians in 1894 they were formally and voluntarily incorporated into the Republic of Nicaragua, their country becoming the Department of Zelaya. This led to difficulties with Great Britain, which were adjusted by a treaty ratified in 1906 in which the sovereignty of Nicaragua was recognized. Pop. (est.), 15,000. Consult Travis, *Clayton-Bulwer Treaty* (Ann Arbor, 1893), and C. N. Bell, *Tangweera: Life and Adventures among Gentle Savages* (London, 1899).

MOSQUITO HAWK. The name of several animals which dart about after small flying insects, as (1) a nightjar or nighthawk, (2) a dragon fly (q.v.).

MOSQUITO LAGOON, or INDIAN RIVER NORTH. A salt-water lagoon on the eastern coast of Florida (Map: Florida, F 3). It lies eastward of the northern end of Indian River, and extends along the coast for a distance of about 17 miles. It is shallow (from 1 to 10 feet deep), has an average width of about 2 miles, and is connected with Indian River by the Haulover Canal and with Hillsborough River (to the northward) by several shallow and narrow channels, through which boats of not more than 3 feet draught may pass by Indian River to Mosquito Inlet and Halifax River. A strip of land from ½ mile to 5 miles wide separates the lagoon from the Atlantic Ocean.

MOSS, mōss. A town of southeast Norway, situated on the east shore of the Christiania Fiord, 33 miles south of Christiania, on the railroad between the capital and Fredrikstad. It has a good harbor visited by steamers, and trades in wood and preserves. Pop., 1900, 8941; 1910, 8648. On Aug. 14, 1814, the treaty was signed at Moss by which Norway consented to a union with Sweden.

MOSS (MDutch, Dutch, OHG *mos*, Ger. *Moos*, moss, connected with Lat. *muscus*, moss). The common name of plants belonging to the Musci (q.v.), one of the two groups of Bryophytes (q.v.).

MOSS, FLOWERING. See PYXIE.

MOSS, SIR CHARLES (1840-1912). A Canadian jurist, brother of Thomas Moss. He was born at Cobourg, was educated at the Ontario Law School, and was called to the bar in 1869. He was lecturer and examiner to the Ontario Law Society (1872-79), a bencher of that society (1880-97), and vice chancellor of Toronto University (1900-06). In 1894 he was an unsuccessful Liberal candidate for the Ontario Legislature. In 1901 he was made a member of the royal commission for the revision of the Imperial statutes affecting Canada. He was appointed a judge of the Court of Appeal (1897) and was Chief Justice of Ontario in 1902-12.

MOSS, FRANK (1860-). An American

lawyer, born at Cold Spring, N. Y. He studied at the College of the City of New York and became a member of the law firm of Moss, Lamberger, Marcus, and Wels. He was president of the board of police of New York in 1897, and served as assistant counsel to the Lexow Investigating Committee and as chief counsel to the Mazet Investigating Committee in 1899. He became professor of medical jurisprudence at the New York College and Hospital for Women and president of the New York Ophthalmic Hospital. While assistant district attorney of New York (1910-14) he figured prominently in the prosecution of Lieut. Charles Becker for the murder of Herman Rosenthal. Moss is author of a history of New York, *The American Metropolis* (3 vols., 1897).

MOSS, RICHARD WADDY (1850-). An English Wesleyan Methodist clergyman, born at Shirley, near Southampton. He was educated at the New Kingswood School, entered the ministry in 1869, and was elected a member of the Legal Hundred in 1899. From 1888 to 1902 he was classical and mathematical tutor in Didsbury College, then tutor in systematic theology, and after 1913 principal. He represented his church as fraternal delegate to the General Conference of the Methodist Episcopal church in 1904 and in 1915 was president of the Wesleyan Methodist Conference. Moss is the author of *From Malachi to Matthew* (1893); *The Discipline of the Soul* (1894); *The Range of Christian Experience*, the Fernley lecture for 1898, *The Scene of our Lord's Life* (1911); *The Life of W. B. Pope, Theologian and Saint* (1912).

MOSS, THOMAS (1836-81). A Canadian jurist, born in Cobourg, Ontario, and educated at Upper Canada College and at Toronto University, where he graduated in 1858 with the highest honors ever won by a student in that institution. He was called to the bar in 1861 and rapidly rose to the highest rank in his profession, especially as an equity pleader. He was made queen's counsel in 1872, and was elected in 1873, and reelected in 1874, for West Toronto as a Liberal member of the House of Commons. In 1875 he was appointed a judge of the Court of Appeal, in 1877 Chief Justice of that court, and in 1878 Chief Justice of Ontario. Moss became a member of the Law Reform Commission (1875) and was vice chancellor of Toronto University in 1874-81. His brief career on the bench was remarkable for the learning, mental grasp, and finished style of his decisions. Failing health compelled him to seek a change of climate, and he died at Nice, France. Consult J. C. Dent, *Canadian Portrait Gallery* (Toronto, 1880), and D. B. Read, *Lives of the Judges* (Toronto, 1888).

MOSS AGATE. See MOCHA STONE.

MOSSÁMEDES, mōs-sā'mā-dēs. The chief town of the District of Mossamedes, Portuguese West Africa, situated on the Atlantic coast 150 miles north of the mouth of the Kunene (Map: Africa, F 6). It is a well-built and regularly laid out town, with a fine government building, church, hospital, and a fort. It is the terminus of a railroad which runs for 125 miles into the interior. The harbor is excellent and equipped with an iron pier, and the trade is considerable. The chief exports are rubber, cattle, and dried fish. Pop., 4500.

MOSS ANIMALS. See POLYZOA.

MOSSBUNK'EE (from Dutch *marssbanker*,

probably from *mars*, peddler's pack, or possibly from *mas*, crowd + *bank*, bank; so called in allusion to the appearance of the fish in shoals¹. A name (heard about New York and New Jersey) for the menhaden (q.v.). It is said by Goode (*Fishery Industries*, Sec. I, Washington, 1884) that the word is a relic of the early Dutch, who took it from their name for the horse mackerel of Europe, which was "marshbanker." It has survived in some localities in New Jersey in its original form, but is more usually cut down and changed to "bunker" about New York and Long Island Sound.

MOSES, WILLIAM (1858-) An English labor leader. He was born in Newcastle-on-Tyne and worked as a pattern maker at the Elswick Engine Works until 1884. In that year he became general secretary of the United Pattern Makers Association. From 1885 on he was a delegate to the Trade Union Congress, and after 1907 was a member of the parliamentary committee. In 1905 he represented the Trade Union Congress at the Pittsburgh Convention of the American Federation of Labor. Moses was also a member of the advisory committee of the National Insurance Act, and (after September, 1913, when it was first instituted) of the sickness claims committee of the Industrial Council.

MOSESSES FROM AN OLD MANSE. A collection of tales by Nathaniel Hawthorne (1846). Many of his famous sketches are contained in it.

MOSSLEY, mós'li. A municipal borough in Lancashire, England, on the Tame, 3 miles southeast of Oldham. Its importance dates from 1840, when there were established cotton and woolen factories and foundries. The town hall is a handsome structure. The municipality owns its markets and its gas works and maintains recreation grounds. It became a municipal borough in 1885. Pop., 1901, 13,452; 1911, 13,205.

MOSSO, mós'só, ANGELO (1846-1910). An Italian physiologist. He was born at Turin, studied medicine there and at Florence, Leipzig, and Paris, and was appointed professor of pharmacology (1876) and professor of physiology (1879) at Turin. He invented various instruments to measure the pulse and experimented and wrote upon the variation in the volume of the pulse during sleep, mental activity, or emotion. In 1900-01 he visited the United States and embodied the results of his observations in *Democrazia nella religione e nella scienza: studi sull' America* (1901). In 1882 he founded with Emery the *Archives Italiennes de Biologie*, in which journal most of his essays appeared. Among his other works are: *Die Diagnostik des Pulses* (1879); *Sulla paura* (1884); *La paura* (1891; Eng. trans. by E. Lough and F. Kiesow, *Fear*, London, 1896); *La fatica* (1891; Eng. trans. by M. A. and W. B. Drummond, *Fatigue*, New York, 1904); *La temperatura del cervello* (1894); *Fisiologia dell' uomo sulle Alpi* (1897; 3d ed., 1909); *Mens Sana in Corpore Sano* (1903); *Vita moderna degli Italiani* (1905); *Escursioni nel mediterraneo e gli scavi di Creta* (1907; 2d ed., 1910; Eng. trans., *The Palaces of Crete and their Builders*, New York, 1908); *La preistoria: origini della civiltà mediterranea* (1910; Eng. trans. by M. C. Harrison, *The Dawn of Mediterranean Civilization*, New York, 1911). Mossso was also a collaborator on the *Nuovo Antologia*.

MOSS PINK. A flowering plant. See **PHILOX.**

MOSS POINT. A city in Jackson Co., Miss., 40 miles southwest of Mobile, Ala., on the Pascagoula and Escatawpa rivers and on the Pascagoula-Moss Point Northern Railroad (Map: Mississippi, H 9). There are extensive lumber mills and a large paper mill manufacturing wrapping paper from pine slabs. Pop., 1910, 3054.

MOSS SIDE. A manufacturing town in Lancashire, England, 1½ miles southwest of Manchester. It is provided with gas, electric lighting, and water by the Manchester corporation. The town owns its tramways and slaughterhouses, maintains a free library, and provides for technical education. Pop., 1901, 26,700; 1911, 33,100.

MOST, JOHANN JOSEPH (1846-1906). A German-American anarchist, born at Augsburg in Bavaria. He learned the trade of bookbinding and in 1863-68 traveled as an apprentice through Germany, Austria, Italy, and Switzerland. On his return to Germany he was first a Socialist writer at Mainz and afterward editor of the *Freie Presse* in Berlin. He was several times arrested and imprisoned because of the violence of his writings. From 1874 to 1878 he was a representative of Chemnitz in the Imperial Reichstag, but in the latter year, having been expelled from the Socialist organization, he went to London, where in 1879 he founded the anarchist organ *Die Freiheit*. In 1881 he was there arrested for printing editorials approving the assassination of Czar Alexander II and sentenced to 18 months' imprisonment. Upon his release he emigrated to New York, where he resumed the publication of his paper. In 1886, and again in 1887, he was imprisoned for inciting to violence. During the following years he continued to publish his paper, lectured, and wrote frequently in the interests of anarchy. After President McKinley's assassination, in 1901, he was arrested for publishing a seditious editorial in *Die Freiheit* and was sentenced to one year's imprisonment. He was sent to the New York penitentiary in June, 1902. Among Most's publications are: *Der Klemburger und die Socialdemokratie* (1876); *Die Lösung der sozialen Frage* (1876); *Mosts Proletarier-Liederbuch* (1875); *Why I Am a Communist* (1890); *Down with the Anarchists!* (1901), a pamphlet published in order to prove that the aims of anarchy are pacific.

MOSTAGANEM, mós'tà-gà-nēm'. A fortified seaport of western Algeria, in the Department of Oran, situated on a steep cliff 280 feet above the Mediterranean coast, 45 miles east of Oran. It has flour mills and tanneries and an active trade in wool, skins, and horses. It is connected by a branch road with the railroad from Oran to Algiers. Pop., 1901, 17,485, of commune, 18,090; 1911, 21,087, of commune, 23,166. Mostaganem, which occupies the site of a flourishing Roman city, was a large and important trade centre in the sixteenth century, but later fell into decay. It has again prospered since its capture by the French in 1833.

MOSTAR, mós'tär. The largest town and capital of Herzegovina (q.v.), situated on the Narenta 33 miles southwest of Serajevo, with which it is connected by rail (Map: Austria-Hungary, E 5). It has a number of modern Italian buildings, but is essentially Oriental in appearance, with numerous mosques, bazars, and Turkish shops. There are a fine Greek cathedral, a higher Gymnasium, a vintner's

ALL NATURAL SIZE

and a trade school. Tobacco and arms are the chief products. Mostar is the seat of a Roman Catholic and a Greek bishop, as well as of a mufti, and has a strong garrison. Mostar was occupied by the Montenegrin army in the European War which broke out in 1914. See WAR IN EUROPE. Pop., 1910, 16,369, including over 7000 Mohammedans.

MOSTELLA'RIA (Lat., ghost). An entertaining comedy of a haunted house, by Plautus, which appears to have been adapted from the *Phasma* of Philemon.

MOSUL, mò-sòol'. The capital of the Vilayet of Mosul, Asiatic Turkey, on the right bank of the Tigris, opposite the ruins of ancient Nineveh (q.v.), and 220 miles by river northwest of Bagdad (Map Turkey in Asia, E 3). It is surrounded by walls now almost in ruins. Of the ancient buildings only the Great Mosque remains. Mosul is the seat of a Roman Catholic mission, Dominican schools, a British political agency, and French and Russian consuls. It is an important military station. Its trade, formerly much greater, is now confined to cotton, hides, wax, gallnuts, gum, and wool, all carried chiefly by caravans. The principal causes of its diminished importance were the rise of Abushahr (q.v.) as an emporium of trade and the diversion of traffic by the Suez Canal. Pop., about 75,000, chiefly Arabs, but comprising also Kurds, Turks, Armenians and others aggregating about 7000 Christians, and 1500 Jews. Mosul was an old Arabic town, taken by the Moslems in 636. It was besieged by Saladin in 1182, and was successively under Mongol, Persian, and Turkish sway until finally annexed to the Turkish Empire by Murad IV in 1638. In the twelfth century it was very important, and for a time supplied Europe with its manufactures, especially muslins, which probably got their name from this town. At present Mosul has acquired importance in the eyes of archaeologists, as the sites of the principal cities of Assyria can be easily reached from its precincts.

MOSYR. See MOZYR.

MOSZKOWSKI, mòsh-kòf'skà, MORITZ (1854-). A Polish composer and pianist, born at Breslau. He studied at the Dresden Conservatory and in Berlin. At 19 years of age he made his debut as a piano virtuoso, and after successful tours throughout the principal European countries settled in Berlin, in which city he subsequently made his headquarters, although after 1897 he became almost entirely identified with the musical life of Paris. The best known of his works is *Spanish Dances*, which nowhere met with greater success than in America, and which may be said to have introduced him to the world at large; he also wrote many pieces for pianoforte, chamber music, concert studies, and waltzes. Among the larger works are *Boabdil der Maurenkönig* (1892); incidental music to Grabbe's *Don Juan und Faust* (1896), a symphonic poem, *Jeanne d'Arc*; overtures, concert suites, a concerto for violin and one for piano.

MOTAZILITES, mò-tà'zi-lits. See MUTAZILITES, MOHAMMEDAN SECTS.

MOTECUHZOMA. See MONTEZUMA.

MOTET' (from It. *motetto*, dim of *motto*, word, from ML. *muttum*, word, grunt, from Lat. *muttire*, *mutire*, to mutter). A sacred vocal composition without instrumental accompaniment, in polyphonic style. As a rule the text of motets is Latin, but there are also motets with German, Italian, and English words. Al-

though the *a cappella* style is the rule, it was not always followed. Especially during the first half of the seventeenth century, which witnessed the beginnings of instrumental music, it was not unusual to add a *basso continuo*, or even a number of violin parts. In some instances we find even motets for a solo voice with instrumental accompaniment. The motet must not be confounded with the *anthem* (q.v.), in which latter form *homophony* (q.v.) is always employed. The form of the motet is very old and has undergone many changes with the various styles of music. The oldest motets were constructed on a *cantus firmus* (q.v.). From the *Ars Cantus Mensurabilis* of Franko of Cologne we learn that a motet had two different texts in the alto and tenor parts. J. S. Bach, in his motets, substitutes the Protestant chorale for the *cantus firmus*. Consult Hugo Leichtentritt, *Geschichte der Motette* (Leipzig, 1908).

MOTH (AS *moþe*, Ger. *Motte*, moth; perhaps connected with Goth. *mapa*, OHG. *mado*, Ger. *Made*, AS. *mappu*, *mapa*, Eng. *mad*, *made*, maggot, grub). An insect of an indefinable section of the Lepidoptera (q.v.), separated from butterflies by superficial features and habits. No scientific distinction exists between these two, and the terms Rhopalocera for the former and Heterocera for the moths have been abandoned in taxonomy. Moths as a rule are nocturnal, while butterflies as a rule fly by day. Moths rest in most cases with the wings horizontally disposed, while butterflies hold them erect, displaying the undersurface. The antennæ of moths are likely to be feathery in shape, while those of butterflies are threadlike, swollen towards the end into a club head. The nearest to a structural division is made by the fact that all so-called moths have a jugum, or hook and eye, by which the fore and hind wings are held together in flight, while such a structure is absent from the butterflies. (See BUTTERFLIES AND MOTHS.) All but four families of Lepidoptera, and by far the greater number of species and individuals, are moths. They are, however, less conspicuous than their relatives, on account of their generally smaller size and inconspicuous hues, but mainly because of their nocturnal habits. They are of more importance, too, in their relations with mankind than the ornamental butterflies, which do comparatively little either of harm or good beyond the delight their beauty affords. The moths, on the contrary, supply the useful product silk, on the one hand, and on the other furnish a great variety of species which, especially in the larval stage, do enormous damage to growing crops and fruit, as well as to stored grain and food-stuffs, and to a long list of materials, in both their raw and manufactured states. The accompanying colored plate represents moths of various families, and exhibits the form and style of coloration assumed. The species figured are described elsewhere. Consult: I. M. Eliot, *Caterpillars and their Moths* (New York, 1902); W. J. Holland, *Moth Book* (ib., 1903); M. C. Dickerson, *Moths and Butterflies* (Boston, 1905); W. F. Kirby, *Butterflies and Moths in Romance and Reality* (New York, 1914). See BUTTERFLIES AND MOTHS.

MOTH, BROWN-TAILED. A name given in England and New England to the European moth, *Euproctis chrysorrhæa*. The moth is white in color, with a brown tip to the abdomen. Its larva feeds on a great variety of trees, and is

gradually spreading in New England. The best remedy is to burn the larvæ cases during the winter. See INSECT, *Economic Importance of Insects*.

MOTHER ANN. A name given to Ann Lee (q.v.), the founder of the Shakers.

MOTHER BUNCH. A nickname given by Tucca to Mistress Miniver, the alewife, in Dekker's *Satromastix* (1602). The name was applied later to makers of jokes, as in *Pasquill's Jestes, Mixed with Mother Bunch's Merriments* (1604) and in *Mother Bunch's Closet Newly Broke Open* (1760).

MOTHER CAREY'S CHICKEN (possibly corrupted from Lat. *mater casa*, dear mother, in allusion to the Virgin Mary). A name familiarly given by sailors to the stormy petrel (*Thalassidroma pelagica*) and other small black-and-white species of petrel. The name Mother Carey's goose, or hen, is in like manner given to the great black petrel, or bone breaker (*Ossifraga gigantea*) of the Pacific Ocean, which is a ravenous feeder on dead whales and other animal garbage and also preys upon other sea birds. See PETREL.

MOTHER CLOVES. See CLOVES.

MOTHER GOOSE. The supposed author of the familiar nursery rhymes known as *Mother Goose's Melodies*. A baseless claim that the name originated in Boston was made on behalf of Elizabeth Goose, whose rhymes were printed by her son-in-law, Thomas Fleet, as *Songs for the Nursery, or, Mother Goose's Melodies* (Boston, 1719). The title appears to have come from France, where Queen Goosefoot, or Bertha au Grand Pied, the mother of Charlemagne, was regarded as the special patron of children, and her festival, January 2, is celebrated. The most definite source is Charles Perrault's *Contes de ma mère l'Oye* (1697), containing 10 stories, seven of which are from the *Pentamerone*. It was translated by Robert Samber in 1729. *Mother Goose's Melodies* were printed in London by John Newbery in 1760. Though the title is probably of French origin, the songs are English, some belonging to the time of Shakespeare and earlier. Consult "Berta de li gran pie," in *Romana*, vols. iii, iv (Paris, 1874-75).

MOTHER GOOSE TALES. See NURSERY LORE.

MOTHER HUBBARD'S TALE, or PROSOPOPIA. A metrical composition in couplets by Edmund Spenser (1591), abounding in satire.

MOTHER MARY OF SAINT ANGELA. See GILLESPIE, E. M.

MOTHER-OF-PEARL. The shells of the large marine bivalve mollusks *Avicula* (*Meleagrina*) *margaritifera*, *Avicula macroptera*, and *Avicula fuenta*, which also produce the precious pearls (See PEARL). These shells are collected in the tropical seas, chiefly on the coast of Ceylon, Manila, Cuba, Panama, the Gulf of California, and the South Sea islands. In 1865 extensive fishing grounds were found on the northwest coast of Australia. The shells from Panama are small and thick and are known in commerce as bullock shells. Those from Manila and Australia are finest in quality; they are disk-shaped and often as much as a foot in diameter. There are two varieties, the white, or silver-lipped, and the black-lipped. The mother-of-pearl or nacre of commerce is really the inner portion or lining of the shell, which the oyster secretes in successive layers of filmy thinness and marvelous smoothness of surface.

Some fine mother-of-pearl is also produced in inland waters, chiefly in the rivers of China, Germany, and Russia. The shells of Mississippi River mollusks have been used extensively in the manufacture of pearl buttons. See BUTTON; PEARL OYSTER. Consult G. F. Kunz, *Fresh-Water Pearls and Pearl Fisheries of the United States* (Washington, 1898), "Mother-of-Pearl Shell Industry," in *United States Consular Reports*, vol. lxxi (ib., 1903) W. A. Herdman, *Pearl Fisheries of Ceylon* (ib., 1905), Kunz and Stevenson, *Book of the Pearl* (New York, 1908), Maurice de Kéghel, *Les perles fines, les nacrés et leurs imitations* (Paris, 1913).

MOTHER OF PRESIDENTS. A name frequently given to the State of Virginia, which has furnished more presidents to the Union than any other State. The following eight were born there: George Washington, Thomas Jefferson, James Madison, James Monroe, William H. Harrison, Zachary Taylor, John Tyler, and Woodrow Wilson. See STATES, POPULAR NAMES OF.

MOTHER OF STATES. A name given to Virginia as the oldest of the 13 American Colonies and because its original territory was formed into a number of States—West Virginia, Kentucky, Ohio, Illinois, and Indiana.

MOTHER SHIPTON'S PROPHECIES. See SHIPTON, MOTHER.

MOTHER'S MARK. See NAAUS.

MOTHERWELL, mūth'ér-wēl. A municipal and police hugh and manufacturing town in Lanarkshire, Scotland, 12 miles southeast of Glasgow (Map. Scotland, E 4). Its growth and importance are due to its iron and steel works and its neighboring collieries. Its specialties are cranes, boilers, and bridge material. It has fine municipal buildings, owns its water works, and maintains a public park, etc. Pop., 1901, 30,418; 1911, 40,380.

MOTHERWELL, WILLIAM (1797-1835). A Scottish poet, born in Glasgow and educated at Edinburgh and at Paisley. His first appearance in print was as editor of a volume of local poems (1810). His *Minstrelsy Ancient and Modern* (1827) won him the acquaintance of Scott. With Hogg, too, Motherwell was on friendly terms, and in 1835 the two prepared an edition of Burns's poems. Motherwell died of apoplexy in the same year, overcome by the strain of testifying before a parliamentary committee on Orangeism. In his *Poems, Narrative and Lyrical* (1832) he utilizes Scottish and Norse mythology and occasionally shows lyric power, as in the familiar "Jeanie Morrison," which it is said was planned at the age of 14.

MOTH FLY. Any one of the true flies of the family Psychodidae—very small, weak flies which look like little moths and are frequently found upon windows and upon the undersurfaces of leaves. They have broad wings, rather thick antennæ, and are densely clothed with hairs, even the surface of the wings being hairy. These are the only true flies, except true mosquitoes, which have hairs or scales on the wings. In the arrangement of the wing veins these flies differ from all other Diptera and probably represent the most generalized type in this order of insects. They differ greatly in larval habits: some live in rapidly running water, others on fallen leaves in small pools, others are found in rotten potatoes, while some live in dry cow dung. The larvæ have both tracheal gills and open spiracles, so that theoretically they can

breathe both air and the oxygen of the water. The family has a wide distribution, but only about 20 species are known in the United States.

MOTH HUNTER. A bird, the nightjar (q.v.).

MOTILÓN, mō'té-lón' (Sp., Cut-haired). A fierce tribe of Cariban stock (q.v.), inhabiting the mountains known as the Painted Andes, about Ocaña, in northeastern Colombia. They were conquered in the early Spanish period and colonized in the lowlands under supervision of missionaries, but on the outbreak of a smallpox epidemic they were compelled to cut their hair to cool the fever and were otherwise subjected to such sanitary regimen that they rebelled and fled to the mountains. They were fugitives for half a year, but returned on the subsidence of the epidemic. On a recurrence of the epidemic some years later the Indians again fled to the mountains, where they have since remained. For nearly two centuries they have been distinguished for their aggressive and untamable hostility to the whites, so that very little is definitely known of them. See YAMEO.

MOTION. See MECHANICS.

MOTION (Lat. *motio*, from *movere*, to move, Skt. *mū*, to push). In law, an application to a court to obtain a direction, or order, in relation to some question or matter incidental or collateral to the main issues of the action. Generally, motions raise questions of both law and fact, and it often becomes a serious question whether a matter can be decided by the court on motion or whether it is of such a nature as to entitle the party against whom the relief is sought to a trial. A motion differs from a trial in that the latter is the judicial method of determining the substantive rights of the parties to an action on the main issues raised by the pleadings, whereas a motion is usually made to expedite the progress of the cause, or for summary relief preliminary to the trial of an action, and cannot be employed to bring up the entire merits of the action. It may, however, be made at any stage in legal proceedings, from a motion to strike out pleadings or to quash or dismiss an indictment, to the motion to set aside a judgment or for a new trial. A motion is regularly based on affidavits or other written statements of the facts upon which the mover relies.

Where there is a question to be decided by the court on which the parties may reasonably differ, the motion can be made only after due notice to the opposite party. Generally any person interested in the subject matter of an action is entitled to make a motion to protect his interests therein, whether or not he is party to it. See AFFIDAVIT; DECREE; JUDGMENT; TRIAL.

MOTION. In music, the progression of the various voices or parts in a composition. Two voices proceed in *contrary motion* when one ascends, the other descends, in *parallel motion* when both ascend or descend, in *oblique motion* when one remains on the same tone while the other proceeds either ascending or descending. In compositions for three or more voices all three kinds of motion may appear simultaneously. Progression of voices in *parallel motion* requires the greatest care because it is here that faulty progressions (fifths, octaves) appear. For this reason the beginner would do well to lead the soprano and bass in *contrary motion* whenever possible. For examples of the different kinds of motion, see Ex. 13, under HARMONY.

VOL. XVI.—22

In respect to the tones of a single part a distinction is made between *conjunct* and *disjunct* motion. In the former case the notes proceed either by steps or semisteps; in the latter by intervals greater than a whole step. The following two examples from Beethoven illustrate this:

MOTION OF PROJECTILES. See PROJECTILES, MOTION OF.

MOTION PICTURES. See MOVING PICTURES.

MOTIONS. A name given to a kind of puppet show, especially illustrating scriptural stories. Motions thrived in England in the fifteenth century.

MOTION STUDY. The analytical observation of workers, usually craft workers at repetitive tasks, to determine the sequence of muscular movements they make. The further purpose is to establish the best and simplest sequence and by instruction make that standard for all workers at that task, thus raising their efficiency. Motion study requires both special aptitude and training on the part of the observer and the highest skill in using the stop watch. Of late the moving-picture camera, including in its field both the worker and a clock with a second hand revolving over a large dial, has been employed by Frank B. Gilbreth, to whom indeed motion study owes most of its literature and its scientific practice. It is a long step towards further refinement of the analysis undertaken in time study (q.v.) and is one of the most actively discussed of the methods advocated by the teachers of scientific management (q.v.).

MOTIVE (ML. *motivus*, moving, from *movere*, to move). In psychology, a general term for the conscious conditions of action (q.v.). As these conditions include always processes of two kinds, sensory and affective, the motive falls into two parts: the inducement, the sensory or intellectual process, the reason for action, and the incentive, the affective process which prompts to it. Thus, a thief is induced to steal by the sight of the unguarded loaf, the incentive to his theft is the unpleasant feeling of hunger. The typical motive to action is the impulse (q.v.). See ACTION.

MOTIVE. In music, the original germ from which all musical form is evolved. A motive generally fills one measure, and two motives constitute the *section*. (See FORM.) The simplest form of motive is the *rhythmic* motive considered apart from the melodic and harmonic progressions, in conjunction with which it generally occurs. Thus, the *rhythmic* motive underlying the principal subject of Beethoven's Symphony in A major is:

and the *complete* (rhythmic, melodic, harmonic combined) motive is:

However, there are also purely rhythmical motives which are set against other complete motives. A famous example is furnished in Beethoven's C minor Symphony, where the rhythmic motive of the principal subject is sounded on the basses against the secondary subject of the violins. In a wider sense the term "motive" is used almost synonymously with "theme." In the use of this term musical terminology is very careless, for "motive" more frequently is applied when "theme" or "subject" should be used. Hence, in theoretical works the term "measure motive" is adopted to denote the simplest form as explained above. The leading motives in Wagner's works should properly be called leading themes. See LEITMOTIV.

MOTLEY, JOHN LOTHROP (1814-77). An eminent American historian, born in Dorchester, Mass., April 15, 1814. He entered Harvard College at the age of 13 and was graduated in the class of 1831. The two years following he spent in Germany at the universities of Göttingen and Berlin, and here he formed an intimate personal friendship with Bismarck which continued till his death. On his return he studied law. He was married, in 1837, to Miss Mary Benjamin, of Boston. Motley's first venture in literature was a story entitled *Morton's Hope* (1839), a very unsuccessful historical-romantic novel. In 1841 he was made Secretary of the American Legation at St. Petersburg, but, owing to the severity of the climate and his regret at being separated from his family, he soon resigned. His first work revealing his real power was a review of a memoir of Peter the Great, which he wrote for the *North American Review* in 1845. Two years later he published in the same periodical a scholarly article on Balzac and in 1849, for the same organ, a review of Talvi's *Geschichte der Colonisation von Neu England*, a paper showing accurate knowledge of the history of New England and of the Puritan movement and displaying philosophical insight. The same year saw the appearance of his *Merry Mount*, an historical novel dealing with an episode in the early life of the Massachusetts Colony.

With this novel, and with an unsuccessful term in the Massachusetts Legislature, ended what may be called Motley's experimental period. He saw the true path for his genius to follow, and he was seized with the desire to write, to cite his own words, "one particular history," that of the Dutch. Having obtained the approbation of the historian W. H. Prescott, on whose territory he feared he might be trespassing, he began to gather material in America, and in 1851 he set sail for Holland to continue his researches. In 1856 appeared the *History of the Rise of the Dutch Republic*, a work in three volumes, published at his own expense. The same year Motley returned to Boston, where he remained about a year; then he went to England in 1858. Here he received the degree of D.C.L. from Oxford, and in 1860 he published the first two volumes of his *History of the United Netherlands*. In England he did his country good service by sending (1861) to the *London Times* two letters on the causes of the American Civil War, which helped to dissipate the British misunderstanding of American affairs. In 1861 he was appointed Minister to Austria, and in Vienna he served the United States faithfully and with tact, until misunderstanding and calumny caused him to resign in 1867. In 1868 appeared the last two volumes

of the *History of the United Netherlands*, a book which sustained the high reputation of his earlier work and its own earlier volumes.

President Grant, on his election, appointed Motley Minister to England, but he recalled him in November of the following year (1870), for what appear to have been unsatisfactory reasons. Motley then retired to private life and began work on the last of his histories. This was *The Life and Death of John of Barneveld, Advocate of Holland; with a View of the Primary Causes and Movements of the Thirty Years' War* (1874), which, in two volumes, virtually completed his plan of the history of Holland and the Dutch. It was his last work. He had suffered an incapacitating paralytic stroke in 1873, and the death of his wife in 1874 was a heavy blow. He himself lingered three years longer and died in Dorchester, England, May 29, 1877.

Motley takes rank with the most distinguished of American historians. His work presents a finished and often brilliantly colored picture of the times and the country with which it deals. It was written only after a thorough examination and analysis of all available documents and is philosophical as well as pictorial in its treatment. It is full of an inspiring love of freedom, has the advantage of dealing with an heroic movement, displays marked skill at characterization, and often flashes with wit. His *Correspondence* is scarcely less brilliant and affords many glimpses of interesting personages, both American and European.

The histories are in print in good English and American editions. Consult: *Correspondence of John Lothrop Motley*, edited by G. W. Curtis (New York, 1889); O. W. Holmes, *John Lothrop Motley. A Memoir* (Boston, 1898). *John Lothrop Motley and his Family. Further Letters and Records*, edited by his daughter, Mrs. S. St. J. Mildmay (New York, 1910).

MOTMOT, mōt'mōt (onomatopoeic, in imitation of the bird's note). A bird of the family Momotidae, related to the coraciiform bee eaters, todies, and kingfishers. The motmots are peculiar to tropical America, and only one (*Momotus caeruleiceps*) of the 20-odd species reaches as far north as the Mexican boundary of the United States. They are birds of very brilliant plumage

TAILS OF MOTMOTS.

a, Lesson's motmot, central rectrices perfect; b, the same, rectrices denuded; c, Mexican motmot, central rectrices affected while yet growing; d, blue-headed motmot showing rackets resulting from complete denudation of a part of the feather.

and about the size of a blue jay, but more slender in form, are solitary in habits, and live on insects, reptiles, and fruits. Their most peculiar feature is the long tail, in which the

middle pair of feathers are longer than the rest and have a peculiar shape which has caused them to be called racket feathers. The cause of the peculiarity has been greatly discussed, and for years it has been supposed that the birds intentionally mutilated their plumage, biting away the vanes from the denuded part. Beebe has recently proved from observation of living birds in captivity, and from macroscopical and microscopical examination of the feather, that a median area of the vane of the central tail feathers is congenitally weak. When these feathers reach full length, shed their sheaths, and become dry, the normal preening, or passing of the feather between the mandibles of the bird, is sufficient to break off the weakened barbs, and in a short time all disappear and the racket is formed. Consult: Belt, *Naturalist in Nicaragua* (London, 1888). *Munio*, in *Ibis* (ib., 1892); G. K. Cherrie, *The Auk* (New York, 1892); C. W. Beebe, "Racket Formation in Tail-Feathers of the Motmots," in *Zoologica*, vol. 1, no. 5 (ib., 1910). See Plate of KINGFISHERS, MOTMOTS, ETC.

MOTONO, mōtō-nō, ICHIRO, BARON (1862–) A Japanese diplomat, born in the Ken of Saga. He graduated from the University of Lyons, France, and was made translator in the Japanese Foreign Office in 1890. He became a counselor in 1893, private secretary to the Foreign Minister in 1895, and First Secretary of the Legation at St. Petersburg in 1896. In 1898 he was appointed Minister to Belgium and in 1901 Minister to France. He became Japanese Ambassador to Russia in 1906 and in the following year was created Baron. He became also a member of the Permanent Court of Arbitration at The Hague.

MOTOORI NORINAYA, mōtō-ō'ri nō'i-ni'ya (1730–1801). A Japanese scholar and poet, the greatest authority, until the era of modern research, upon the customs, history, poetry, and religion of ancient Japan. He wrote many books, his most important being a commentary on the *Kojiki* (Records of Ancient Matters, the oldest extant Japanese book). The commentary is in 44 volumes. It was begun in 1764 and finished in 1796. Upon the publication of the first part students came to Motoori from all parts of Japan. In 1801 he lectured in Kyoto to crowds, princes and nobles being among his auditors. His influence increased after his death, and his writings are thought to have aided in bringing about recent changes in the Empire. He is regarded as a master of literary style and *tanka* or short poetry.

MOTOR BOAT. A generic term applied to small vessels propelled by internal-combustion motors or engines and, sometimes, by electric motors, but never to steam-driven craft. As the word "boat" has come to be used only when referring to a relatively small craft, as distinct from a vessel or ship, so the term "motor boat" is applied only to small vessels. Those over a length of approximately 65 feet are usually designated by their type, rig, or the kind of service for which they are employed—such as motor yacht, motor schooner, motor tug, or motor barge. The name is never applied to craft where the power is used as auxiliary to sails, in which case the name of the rig is used as a distinguishing appellation—as, e.g., auxiliary sloop, auxiliary schooner, and the like.

Though the internal-combustion gas motor was first put into practical operation by Dr N. A.

Otto in 1876 (credit for its conception belonging to M. Beau de Rochas), it was some years later before the principle was used for marine purposes, and it remained for others to develop it for propulsive power for boats. (See INTERNAL-COMBUSTION ENGINE.) The history of the marine gasoline engine proper may be said to date from 1885, when the first successful gasoline engine for any purpose was placed on the market, though experiments had been made along these lines both in the United States and in Europe. Until the early nineties the marine gasoline-engine industry remained almost at a standstill, but by 1893 a number of small gasoline marine engines were in successful use and several boats driven by this power were exhibited at the World's Fair in Chicago. Boats driven by electric motors run by current furnished by storage batteries were successfully operated about 1890, but made their first practical appearance at the World's Fair. These boats have usually been called electric launches, to distinguish them from boats driven by internal-combustion motors, and as the latter type developed in such a satisfactory manner, electric launches have fallen into disuse and are a negligible quantity in the field to-day.

At first one of the chief drawbacks to the use in small boats of engines built on the Otto-cycle principle was their weight, and in the efforts to produce a two-cycle motor, built on similar lines but receiving an impulse at every revolution instead of every other, thereby allowing reduction in weight, the names of Day and Nash in England and Sintz in the United States stand out prominently.

Before the internal-combustion engines were sufficiently developed for satisfactory marine use, various types of hot-vapor engines were developed to take the place of steam for power in small boats, and of these the naphtha, the alco-vapor, and the Daimler were the most successful and were placed on the market between the years 1885 and 1890. Naphtha and vapor engines differ from internal-combustion motors in that they are pressure engines, similar in general principle to steam engines, but in which the vapor of the more volatile liquids is used instead of steam. In the naphtha engines the heat for the boiler was generated by a portion of the vapor from the boiler flowing to the burner, the remainder passing to the engine and furnishing the power. The power in the alco-vapor types was furnished by the evaporation of alcohol, using gasoline as fuel. These vapor engines were vastly superior to steam for small-boat use, weighed less than a steam outfit, and were reliable. They were in great demand for pleasure-boat use up to about 1896 or 1897, and while the boats they were in were usually called naphtha or alco-vapor launches, they were in reality motor boats. As the gas engine became perfected, however, it offered so many advantages over the vapor engines that the development of the motor boat since those years has been along lines recognizing only some form of gas engine for power.

The coming of this new type of power for small-boat use brought with it a new problem in boat design. The small steam launches that up to that time had been in use had, as a rule, been evolved without much thought as to design or fitness for the work expected of them. Not much attention was given to stability, seaworthy qualities, or ease of propulsion. It was

natural when the smaller, internal-combustion engines began to make a claim for recognition for boat use that they should be tried first in the same type of craft used for steam. They were put into open boats of the steam-launch model, and at first all the efforts of builders were towards developing the *power* rather than the boats.

Under the influence of naval architecture the old hybrids of steamboat, rowboat, and steamship models were abandoned; overhanging clipper bows, cutaway underbodies, and ocean-steamship sterns in boats under 35 feet long began to disappear, and in their places came properly designed hulls, with fair curves, making them easy to drive, good sections with plenty of flare forward, proper sheer, etc. The old counterstern, which gave no bearing aft, was discarded, and in its place came the torpedo stern, the pointed or canoe stern, and, lastly, the straight transom stern.

At first most of the boats that had cabins were given a high glass-windowed house that was

hydroplane had been experimented with for some time, but with no very practical results, the theory being to decrease the displacement and wetted surface of the hull by lifting it above the water, as the boat ran, by means of planes, adjustable or stationary, working on the water and projecting in various ways from the hull itself. In 1876 M. de Sanderall worked out a craft in France that embodied these principles but proved a failure, and in 1897 Count de Lambert (France) built his first gliding boat that achieved any measure of success. Like his predecessors he was working with steam for power, and, as in the case of the aeroplane, no marked measure of success was obtained until the perfection of the internal-combustion motors allowed of their use, light and powerful engines being essential in boats that must lift out of the water as they run.

Dr Peter Cooper Hewitt experimented with a boat in which the lifting planes were not on the bottom, but were carried by a rectangular framework around the hull, the planes themselves projecting outward several feet from this framework and below the bottom of the boat so that the hull could be lifted entirely out of the water while the planes would still be immersed. The propeller, of course, worked in the water. He obtained a speed of about 30 miles an hour with this craft, but it had the drawback of not being able to run in any but the smoothest water. Another pioneer who developed boats of this type, whose supporting planes pass through the water, was Signor Enrico Forlanini.

Later W. H. Fauber, an American, conducted many tests in France of a hydroplane with a series of six or seven steps and short planes of a V section on its bottom that really marked the beginning of the present type. In this craft the accepted form of boat hull above the water was retained, and a much more seaworthy craft was produced which could still maintain very high speed. It was the remarkable speed of *Pioneer*, a Fauber hydroplane that raced in the United States in 1910 for the British International Trophy, that was largely responsible for the discarding of the displacement type of boat in America and the development of the hydroplane for high-speed purposes.

In hydroplane construction it is known that, theoretically, the lifting power increases with the size of the planes, and it has been the aim of naval architects to find just the proper size and angle of planes to produce the best results. This has led to several distinct types, each with its adherents: boats with many shallow steps, called multiplanes; boats with a single step in the middle and two planes, called biplanes; and boats with a single flat plane and no step, called monoplanes. The present tendency is towards the two latter types. Some work has been done with hydroplanes with

COOPER HEWITT HYDROPLANE.

Showing the series of submerged planes which lift the hull of the boat entirely clear of the water when running.

not only unsightly, but tended to make the boat top-heavy and was not water-tight. The first departure in this direction was the adoption of the trunk cabin, borrowed from the sailboat, and the ceiled cockpit, which made a much abler boat, as it was entirely inclosed. Then came the raised deck forward, which gave more room below and produced a better proportioned hull and, if properly designed, a drier one. In the development of the cruising type of motor boat the power-boat races from New York to Bermuda, which were started in 1907, played a great part in producing an abler and more seaworthy type of craft. This race was for boats between 40 and 60 feet in length, and the best average time over the 670-mile course was 10.3 knots per hour, made by *Ailsa Craig* in 1907.

Motor boats used for pleasure can be classified under four general heads—viz., open boats, cruisers, speed boats, and hydroplanes—and each classification has been developed along separate lines. Up to about 1905 in Europe, and to 1910 in the United States, the speed-boat development followed normal lines with displacement models; but between those years the influence of the hydroplane, a boat with a series of two or more planes with steps between them for lifting the body of the boat out of the water, began to be felt. The principle of the

propellers working in the air (as in an aeroplane) instead of in the water, but these have not shown as much speed or any advantage over those operating in the conventional way.

With the development of the light-weight automobile engine this type of power plant was tried in lightly built speed boats, and motor-boat

just quoted are official, this record has been much questioned, and it is probable that the course was inaccurate (possibly being in statute miles instead of knots) or that some of the mark buoys had dragged. If correct, this was the highest speed ever attained by a motor boat.

In 1914 the highest racing speed obtained

FAUBER HYDROPLANE

Showing application of the principle to hulls of accepted design. Note the concave surfaces of planes.

racing became popular. This has undoubtedly led to the wonderful development in speed upon the water. Annual regattas for boats of this type were held both in Europe and in America, those at Monaco, France, and the races for the Gold Challenge Cup in America and the British International Trophy being the most important. The latter is an international trophy presented in 1903 by Alfred Harmsworth, later Lord Northcliffe, to encourage the development of high-speed craft under 12 meters (about 40 feet) in length. The first race for that trophy was held in 1903, when a speed of about 20 statute miles per hour was obtained. In 1907 it was captured by *Dixie I* with a speed of 31.8 statute miles per hour, owned by E. J. Schroeder and representing the Motor Boat Club of

was by *Baby Speed Demon II*, a 20-foot biplane, in the Gold Challenge Cup Race, where she averaged 50.55 statute miles an hour over a 30-mile course. The best official record for 1-mile trials, averaged with and against the current, is 53.54 miles per hour, made by *Baby Speed Demon II* in 1914.

In the commercial field the coming of the motor boat has revolutionized many industries. In fishing, lobstering, oyster dredging, and in small freight, passenger, and tug boats, the internal-combustion engine now is almost the only recognized power. Taking the place of the sail-boat on the coasts and lakes, it gives a power that is reliable, economical, and that greatly increases the radius of operation of the fisherman, while it allows him to make his market

MODERN SINGLE-STEP HYDROPLANE OR BIPLANE

Such as record-holding *Baby Speed Demon II* (American)

America, and remained in America until 1912, when it was taken back to England by the hydroplane *Maple Leaf IV* with a record of 43.125 statute miles per hour for a 30-mile race. In 1913 it was successfully defended by the same boat, which made the phenomenal speed of 49.2 knots (56½ statute miles per hour). It is only right to say that, while the figures

with a certainty unknown under sail. In the oystering industry the hoisting machinery for the dredges is also operated by this power instead of by hand. Even in the deep-sea fisheries the gas motor is used as auxiliary power up to 150 or 200 horse power, both to enable the boats to follow the fish and to market their catch without having to wait on the wind;

while in South America and other remote countries this type of power is supplanting sails for commercial purposes in small craft.

Apart from the fitness of this type of power for small craft, and the fact that the motors occupy little room and can be placed in almost any desired part of the boat, another cause for its popularity is that no licensed engineer is required for its operation. With the steam plants, no matter in how small a boat they were installed, a licensed engineer was required by the United States laws, but in motor boats no licensed engineer is necessary. The United States laws governing the inspection and operation of vessels on United States waters define a motor boat as "every vessel propelled by machinery and not more than 65 feet in length, except tugboats and towboats propelled by steam." These motor boats are divided into three classes as follows (Laws of 1914):

Class 1. Less than 26 feet in length.

Class 2. Twenty-six feet or over and less than 40 feet in length.

Class 3. Forty feet or over and not more than 65 feet in length.

The government regulates the equipment of these boats (both navigating and life-saving), but does not require licensed operators or navigators, except where a boat is used to carry passengers for hire, in which case a licensed operator is required, though no examination is necessary for obtaining such license. Motor boats of under 16 gross tons do not even have to be registered or enrolled, though boats over that tonnage do, and must apply for United States government registry.

MOTOR COAL CUTTER. See **COAL**, and **Plate of COAL.**

of the bicycle rider. (See **INTERNAL-COMBUSTION ENGINE**; **MOTOR VEHICLE.**) The operator rides astride of the frame of the machine, his feet resting upon special foot rests. The earlier designs had one cylinder, later and more powerful machines were fitted with twin cylinders, and four cylinders have been installed on larger, heavier designs. The motor axle is the treadle shaft of the foot-driven machine, and power is conveyed to the rear or driven wheel by chain, belt, or shaft drive. Some of the newer and more flexible machines are fitted with a variable-speed gear, or transmission gear box, so that there may be two or more speeds for the driving wheel with their increased leverage for hill climbing and for convenient manipulation in traffic of crowded streets. The motor cycle has all the elements of operation and control which belong to the motor-driven four-wheeled vehicle—tank for fuel, tank for oil, carburetor, throttle, spark-advance control, clutch, magneto, spark plugs, muffler—but is of necessity always air-cooled. The front wheel is the steering wheel.

This vehicle is much used in the control of street traffic in cities and on highways, and in military dispatch work, by reason of its possible speed and manœuvring power. Its light weight, ease of storage and upkeep, and its lower purchase price have made it popular for trips and touring without much bulk of luggage. The rider cannot be protected effectively from mud or dust or weather and must usually be dressed in conformity with these limitations. The motor will usually be started by a few strokes of the foot pedals or by a run of a few feet on the ground with the clutch engaged. As the motor cycle is developed to carry more than one person, it may become a tandem motor cycle, or a side car may be added (see **SIDE CAR**), which makes it a tricycle in effect, or it may pass into a four-wheeled vehicle and become a cycle car (q.v.). The thirteenth United States census for manufactures (1913) reported the output of motor cycles in 1909 as 18,628,

11-H. P. TWIN-CYLINDER MOTOR CYCLE WITH COMPLETE ELECTRICAL EQUIPMENT.

MOTOR CYCLE. A form of the bicycle or two-wheeled apparatus for transportation, with the wheels in the same plane, in which the power is derived from an internal-combustion motor which replaces the weight and muscular effort

value \$3,015,988, compared with 160, value \$33,674, in 1899. The exports of motor cycles in 1914 were 6410, value \$1,234,194.

MOTOR GENERATOR. See **DYNAMO-ELECTRIC MACHINERY**

MOTOR ORGAN (Lat. *motor*, one who moves, from *movere*, to move). A structure which when stimulated moves the parts attached. Motor organs are found at the base of leaves and leaflets in various plants, particularly members of the bean family (Leguminosæ). They are formed by the modification of the structure of the main leafstalk and of the stalks of the leaflets (Fig. 1) When the latter

FIG 1. MOTOR ORGANS OF LEAF OF BEAN

The primary organ at the base of main petiole, secondary ones at the base of each leaflet, the lower figures show the curvature of these organs after stimulation (blades cut away to show more clearly)

are short the motor organ may constitute the whole stalk. The motor organ is a cushion (pulvinus) of very thin-walled tissue (parenchyma) whose centre is occupied by a strand of vascular and mechanical tissue (Fig. 2) This is in sharp contrast with the structure of the stalk elsewhere. There the outer parenchyma forms the usual cortex, the vascular and mechanical strands are distinct and often numerous, and the centre is occupied by a pith (parenchyma) of considerable volume. The central position of the strands in the motor organ obviously permits freer bending. The cells of the parenchyma are normally turgid, and by mutual pressure the organ is kept rigid, supporting the leaf or the leaflet. The action of an appropriate stimulus on the plant results in the exudation of water from the cells on one side of the pulvinus. This water passes into the intercellular spaces of the organ and the cells of course lose their turgor. Owing to the now unopposed pressure of the still turgid cells on one side of the organ, it bends more or less, the flaccid side becoming concave, and the leaf blade

is carried through a considerable arc. In the sensitive plants (*Mimosa*) of the tropics contact is the usual stimulus. The whole reaction takes place very rapidly, the time from shock to response being only a fraction of a second. In other plants variations in the intensity of light cause similar but slow curvatures in the motor organs. Later work on the physiology of the action of these organs indicates that the movement is brought about by a change in the permeability of the cells of the pulvinus to solutes contained within the cells. With an increase in permeability there is an exudation

FIG 2 LONGITUDINAL SECTION THROUGH MOTOR ORGAN OF SENSITIVE PLANT (*Mimosa pudica*).

of solution into the intracellular spaces and a shrinkage of that region of the organ. A decrease in permeability acts in the opposite way. Some stimuli (photonastic, thermonastic, anaesthetics) increase or decrease the permeability of the cells on both the upper and lower halves in the same direction, but in a different degree; others (phototropic and thermotropic) modify the permeability in one-half of the pulvinus only, and still others (geotropism) modify the permeability oppositely in the two halves of the organ. It is possible also that condensations and hydrolysis of cell substances and even changes in water-absorbing capacity by wall and protoplasmic colloids are involved in these reactions. See MOVEMENT

MOTOR TRUCK. See MOTOR VEHICLE.

MOTOR VAN. See MOTOR VEHICLE.

MOTOR VEHICLE (Ger. *Motor-wagen*) A carriage for the transportation of passengers or a truck for transportation of freight, fitted to run on streets and highways without a track, and having the force to propel it generated within its body, or on its frame, or stored within it, so as to be operated without horses or other sources of tractive force outside of itself and transmitted thereto. The emphasis should be laid primarily on the principle of the generation of power or the release of stored energy within itself, and secondarily upon its freedom to operate for this reason on any road without a permanent track or a connection by wire or otherwise to a central power-generating station.

An historic study of the motor vehicle has been made under the article *Automobile*, (q.v.). It may be studied from its practical or industrial aspects from several points of view:

- I. Its uses and the exterior forms which such uses impose.
- II. The motive power used to secure propulsion.
- III. The running gear, frame, springs, and wheels.

I. The uses to which a car is to be put and the purposes which it is to serve condition its design as a structure and as a machine. These determine first of all the weight to be borne and the speed at which it is to be moved. These fix the frame, the springs, the motor and its gearing, and the design of the body, and are therefore of primary consequence. Motor vehicles may be divided as respects their uses and function into two groups:

1. Passenger vehicles; often called cars
2. Freight vehicles, often called trucks

A subordinate grouping of passenger vehicles may be into pleasure vehicles and business or commercial vehicles, the latter operated for hire or as productive investments.

The passenger vehicle for pleasure was the first to appear, the freight-carrying vehicle coming as a later development. The body or passenger-carrying part was based on the single-seated buggy or runabout. This provided for the driver and one passenger and carried the motor and its mechanism under the single seat. The surrey or stanhope carrying four was the next step, and from this four-passenger type were developed the designs of touring car which shortly became standard. The French recognized at once the inconvenience of access for repair and adjustment which resulted from having the motor under the body, and they placed it in front of what was formerly the dashboard of the horse-drawn vehicle. The dash was no longer needed to keep mud and splashings from the occupants of the front seat; but a partition has remained to occupy its place and keep the motor and its heat and oil confined in front of it.

The military engineer of France has called the stationary part of the mounting of a fortress gun by the term "chassis." It means the foundation for all the structure and the mechanism which are needed to train the carriage and elevate the piece—in general, the basis of all movable parts for control and manipulation. So the designer of motor vehicles calls the frame and springs, the wheels and motor and transmission of power to the wheels, taken together, by the name *chassis*. The rest of the structure of the car he calls *body*. Evidently one design of chassis can be used for many varying forms of body.

Confining attention for the moment to the types of body, the preëxisting surrey or carryall of the horse vehicle carried four persons, or three besides the driver, and had no sides. It often had no doors of entry to the rear seats and never had any for the front seats. The speed of the motor vehicle made protection from weather and dust and the safety of the rear passengers imperative, while any added weight of body could be met by increasing the sizes of the springs and the motor. Hence the rear of the body received a shape derivable from a cup or bowl or tankard, and the French, catching the resemblance of such rear body to an ornamental barrel in which the passengers sat, called this rear portion the *tonneau*, or hog-head. The name remained long after the bulging curves and exaggerated molding disappeared. The most curvilinear and ornate kind of *tonneau* was called the King of the Belgians model, from a specially luxurious car designed for the late King Leopold. With the displacement of molded wood for bodies by the sheet-metal body of aluminium or steel, a severer

and more artistic modeling came into use, following what in the design of ships has been called stream lines.

The *touring-car* body can carry two on the front seat and three on the rear. By lengthening the rear body two additional seats can be introduced, either permanent constructions or arranged to fold and be put out of the way. Early *tonneaus* opened in the back, later side doors became practically universal. The touring car is therefore called a five or seven passenger car.

As originally constructed the touring car had no shelter to protect its users from the weather. The increased use in all weathers, in extreme heat and in cold, has brought about the use of what is called a top. Its presence introduces some new types of body with their names. When the body becomes completely inclosed in a permanent construction behind the front seat, with glass in windows on rear and sides and roof over the driver's seat, and for three or five passengers within it, the car becomes a *limousine*. Later designs included also the driver and the front seat in the permanent side inclosure as well as under the roof. The name is French and is that of the district from which it first came. If the top be so constructed that its rear portion can be lowered, leaving the more permanent front portion in place, the model becomes a *berlet*. The *brougham* or *taxicab* model is often made in the *berlet* type, but without having the roof cover the driver. Canopy tops supported upon rod posts had a temporary vogue, but have been superseded by the *cape top*, a derivative of the buggy or barouche top, supported upon bows or frames, so that it can be completely lowered at the back of the body. The *cape top* requires side curtains to inclose the seats completely. A glass or other wind shield is the usual equipment over the dash, to protect those on the front seat, while yet giving the driver uninterrupted view ahead.

The touring car is above all the type of pleasure vehicle for the lover of road travel in the open country. It will carry a moderate amount of luggage, its light weight makes easy-riding springs possible, and it accommodates a large family or party of guests. The *limousine* is the car of luxury and for use in well-paved cities. It protects the passengers from the weather, wind, and dust, and can therefore be used by wearers of expensive gowns or persons in evening dress. The size and weight make the *limousine* ill-adapted for rough roads, and it should not be operated at speed. In use as a town car with driver and second man, the *limousine* puts both employees outside of the inclosed body. In the touring car the mechanic may have a seat on the running board if the owner drives.

The first touring-car and *limousine* bodies were made without doors to the forebody, in which was the front seat. The standard is to have fore doors so that the driver and the other at his side may be protected from weather and dust. An effort to reduce weight and cost for the rear body resulted in the so-called *toy tonneau*, seating two, in which the height of back and sides was reduced, and usually the side doors omitted. This has not won general acceptance, as the doors contribute greatly to safety and the high back and sides to comfort and cleanliness.

The fine coach work on the *tonneau* surface

was costly, the weight was hard on tires and increased the fuel cost; entertainment of guests on tour was expensive to the host, and the big car was more costly to make and to buy than one which would carry only two persons. Hence occurred a reversion to the earlier type derived from the buggy, a type which is called the *roadster*. It is a touring car built for two and has a single seat and usually a folding or small cape top. Behind the seat are the tanks for gasoline and lubricating oil, or a box for luggage and spare parts. Trade names of *cruiser*, *tourabout*, or *raceabout* have been created by some manufacturers, but they are not likely to survive. The roadster has been a special choice of many physicians as being a light, powerful, speedy, handy, and serviceable vehicle for their special conditions, and in general it has commended itself where the owner is his own driver. A difficulty of the type in some forms has been that the removal of the rear seat has unduly reduced the weight on the hind wheels for traction, so that in snow or on hills the driving wheels have not held to the road surface in a satisfactory degree. The car body vibrates with the roughnesses of the roads, owing to the lessened mass and weight. Many owners who desire to use the motor vehicle in their business have chosen the roadster and utilized the space at the rear of the seat and over the wheels to carry merchandise.

The roadster develops into the *racing car* or *racer* by emphasizing its adaptedness for speed. The carrying capacity is limited to that of the driver and his mechanic. The centre of gravity is made as low as possible, to secure safety at turns, the motor capacity increased, and the transmission gear receives a high ratio to compel the car to move a greater distance for each revolution of the motor. Very low seats are noticeable features of this design, compelling the legs to assume a nearly horizontal position. Fuel and oil tanks are always at the rear, behind the seats.

The first motor vehicles were driven always by their owners for pleasure and sport, and there were no paid employees to act as drivers. This fact gives an interesting side light on the origin and meaning of the term "chauffeur," now so generally applied to a salaried employee who drives the car for an owner. The first introduction of the motor-propelled vehicle among the bicyclists of France was received with abuse and contumely. "Such a man is no sport," said the users of muscles; "he is nothing but a boiler tender. Out upon him!" Now, the French term for a boiler tender is "chauffeur," and such owner of a lazy temperament who preferred a mechanical motor to his legs was a chauffeur, a term of derision. On the footplate or in the cab of a locomotive the driver of the engine is the chief and is called the mechanic. The boiler tender, or chauffeur, is his assistant. Hence when the owner drove his car his employed subordinate was in the relation of chauffeur to the mechanic as respects his employer, and the practice of having the employee drive for the owner resulted in the use of the term for the salaried driver, who is properly also the mechanic in most cases. In racing, the second man is never called a chauffeur, but always a mechanic or mechanician.

If the roadster be still further reduced in capacity, weight, and cost, so as to provide for the operator only, it becomes a *motor bicycle*

or *motor cycle* (q.v.). But the developments of the motor cycle where the roads are good has resulted in the attachment of a *side car* for a passenger, and the further design of a *voiturette*, or *voiture-legère*, in France, in which the tricycle or three-wheeled motor cycle has grown into a light four-wheeled vehicle built on motor-cycle lines, but with motor-vehicle features. (See CYCLE CAR.) These approach roadsters as they increase in size, power, and weight. They have a narrow gauge and a motor of small size. The development of the limousine or touring car to secure passenger-carrying capacity for more than six besides the driver has resulted both in the *wagonette*, which is a short omnibus with seats on the sides of the inclosed body so that the occupants face each other, and the *motor omnibus* with passenger seats on the roof. This is not comfortable for road riding at speed nor for sight-seeing. Hence the *motor diligence* or *sight-seeing* vehicle has been produced, where a number of seats are arranged across the vehicle, the occupants all facing to the front. For sight-seeing each seat is slightly elevated above that in front of it; and a canopy top can be spread in case of bad weather. These latter of course are business or commercial vehicles.

A design of *motor buggy* has had some vogue where mud is deep or snow lies heavily. It preserves the large wheel diameter of the horse-drawn prototype and puts the motor under the body. Its object is to meet the requirements of deeply rutted highways where great clearance between the ruts is required. The large wheels require heavy reduction in the transmission mechanism and make a structure which it is hard to make strong enough to withstand the shock of a high speed. The light, long-spoke wheel is of necessity also a steel-tired wheel, and this fact keeps speed down. The motor buggy has disappeared therefore in many districts, and will disappear more completely with the era of good roads.

MOTOR TRUCKS

The freight-carrying class is known as *commercial vehicles*, *motor trucks*, *motor vans*, and by special names resulting from their functions. The special features are capacity for heavy loads and the provisions for loading and unloading. The earliest forms were the delivery wagon, adapted to carry light freight or bundles from store to buyers. These were special or horse-wagon bodies placed on a touring-car chassis. Later the larger and heavier types were designed, with special chassis, wheels and springs, and specially designed motor. For delivery work from department stores a duplicate body has been found a measure of economy, so that one body can be loaded at the store while the other carried on the chassis is on the road. Dumping bodies for coal and building materials can be operated from the motor. The wheels and springs require to be of special strength by reason of the heavy load, and for this same reason the speed will not be high, and extra heavy gearing is made necessary. The body designs range from the ordinary stake equipment of the dray up through the heavy express-wagon body to the special steel bodies for coal and similar material. A type of commercial wagon for stone and building material has six wheels. The rear pair are those of the

ordinary contractor's wagon, but in front of these is a special forebody, carrying the motor, steering gear, and driver's seat, and coupled to the front axle of the cart at the fifth wheel. Or, again, this motor part may have one wheel only, which may be both the traction and the steering wheel. Both designs have been accepted also as transitional designs for city fire apparatus, to transform the existing and still useful pumping machinery into motor-drawn units to increase speed and reliability. In time, however, all the motor-drawn units will depend on the internal-combustion motor for pumping as well as propulsion, and much machinery designed to this end as a single unit is now in use. See FIRE ENGINE; FIRE PROTECTION.

The motor truck or delivery wagon shows its greatest economy when it is running on the road continuously and without stops of any considerable length either in receiving its load or in its detailed delivery. In the case of delivery wagons hastening the unloading process is the great factor.

SYSTEMS OF PROPULSION

II. The second point of view from which to consider the motor vehicle is that of its mechanical propelling power. By definition above, this is to be generated either outside of the vehicle and stored within it for use, or it must be generated as required in or on the vehicle itself. There will therefore be two classes:

1. Power-storage systems
2. Generated-power systems.

The electric vehicle is the representative of the first class; the steam-propelled and the internal-combustion or gasoline motors represent the second class.

The air of the atmosphere or any other cheap permanent gas can be compressed by a power-driven air compressor into strong steel reservoirs at a high tension and gradually be allowed to expand in an air engine down to atmospheric pressure. In this drop of its pressure it can propel the vehicle, just as steam drives a locomotive. The system has much to commend it both theoretically and practically. It is clean, simple, easily comprehended, and has no fire risk and no trouble from acids or vapors. It is not commercially practicable on the ground of expense: the radius of action of such a car is relatively small, and it is difficult to get the compressed-air tanks recharged in general touring in the country or even in many cities.

The Electric Motor Vehicle. In the electric storage system a chemical compound very ready to oxidize is reduced by passing an electrical current through it. This in effect charges the battery cell containing the compound, and when desired the process of oxidation in the battery solution gives out the electrical energy previously stored. The current need only be led by wires through the necessary switch for reversing and through a controller to an electric motor in mechanical connection by gearing to the driving wheels. In the early electric vehicles two motors were used, one for each wheel. This made differential gearing unnecessary for going around curves. The newer designs have shaft drives, and gearing transmissions, so as not to draw down the battery energy too fast on hills.

The electric vehicle with a charged storage battery has a radius of action limited by the capacity of such battery. To increase the num-

ber of hours during which it will supply constant energy is to increase the number of cells and the consequent weight. The battery should be capable of being easily removed from the vehicle when nearly exhausted and replaced by one freshly charged. The batteries can be recharged wherever electrical energy is available, but there are of course many rural neighborhoods where charging is troublesome. The electric vehicle is by excellence the town car, and for paved and level streets. The ordinary battery capacity for a four-passenger electric brougham or roadster at average speed and on level or slightly rolling roads will carry it 75 miles. Heavy loading, poor road surface, heavy hill climbs, sand, mud, or snow will reduce this limit proportionately. This capacity is given by 40 cells in a lead battery of 13 plates each, or by 54 cells of the Edison design. The lead battery will weigh 1300 pounds and the nickel-iron battery about 1000 pounds. The controlling mechanism in standard designs is designed to give speeds of 5, 8, 13, 17, and 20 miles per hour. At the ordinary suburban rate of six cents per kilowatt hour for battery charging, the usual cost for charging current for a day's usage will be about \$1.50.

Steam-Propelled Motor Vehicles. In the second group of types of motors for propulsion the steam-driven vehicle is historically the first. (See AUTOMOBILE.) In this system a fuel is burned under a boiler to generate steam, usually at relatively high pressure, which latter drives a reversing steam engine similar to that of the railway locomotive. The shaft of this engine is connected by reducing gears to the driving axle and its wheels. The fire box is open to the air to admit oxygen for the combustion of the fuel, and there are hot products of the combustion to be disposed of. The higher the pressure of the steam, the smaller the engine can be for a given power; hence the engine is usually compound, so as to utilize all the available energy of the steam. Steam-driven vehicles in America have been exclusively of the passenger and pleasure types, although in England steam-driven trucks have had some vogue and success. In France the best-known work with steam vehicles was done by M. Leon Serpollet. In 1889 he designed a type of flash boiler in which the water was pumped in small quantities into a coil of pipe close to the burner, where, owing to the intense heat, the water became steam with great rapidity and was then passed into a series of twisted flat tubes in the current of hot products of combustion, where it became highly superheated. The fuel used was gasoline or kerosene oil, the combustion being effected first by vaporizing the liquid and then mixing it with the necessary air in a burner on the Argand principle. The Serpollet engines were four-cylindere, either with the axis of one pair at 90 degrees with that of the other and each axis at 45 degrees with the vertical, or with the cylinders in pairs opposite to each other in a horizontal plane (double opposed). The power plant of the American steam pleasure vehicle has had two forms: in one the boiler is a fire-tube upright boiler; in the other it is a semi-flash water-tube boiler of coils of steel pipe. In the early Stanley designs the boiler had steel heads and copper fire tubes, the shell being of copper, bound closely with steel piano wire to give great strength against rupture while preserving ductility to resist sudden changes of

temperature. The liquid gasoline was fed to the burner under considerable pressure. The boiler held little water at one time, and was therefore safer than if more energy had been stored in a larger mass of highly heated liquid, but great care had to be exercised to prevent the water being exhausted, as the boiler would promptly burn out by overheating at the joints. The semi-flash boiler of the White Company introduced the cool feed water at the top of the series of coils, farthest from the heat of the burner, and drew out superheated steam from the hottest coils at the bottom close to the flame. Sudden changes of temperature were avoided and life for the coils secured. There was not much water in the coils at any one time, and their factor of safety was very high. Most ingenious devices were used to make the fuel supply at the burner and the water supply to the coils automatic in relation to speed of the motor and the demand for power, and when they were in good order they left nothing to be desired. The English motor trucks or vans

6. The complication of the automatic devices and their continual need of care and upkeep.

7. The relatively high fuel consumption per mile

Internal-Combustion System. The practical advantages of the internal-combustion principle have put it far in advance of the steam system in the modern development of both the passenger and the freight vehicle.

The propulsive energy in this system is derived from a mixture of fuel gas or vapor with air in proper proportions to burn actively and instantaneously when ignited. This mixture is drawn into the cylinder by a suction stroke of the piston and is compressed upon the return traverse; at the instant of maximum compression (or just before) it is ignited by a spark and the ensuing combustion causes a great increase in pressure, due to the increase in the volume of the gas when hot as compared to its volume when relatively cool before firing. This pressure acts on the piston and the power stroke is communicated to the crank shaft. The final

THE SUCCESSIVE STAGES IN A FOUR-CYCLE MOTOR-CAR ENGINE

burned either coke, coal, or liquid fuel, such as kerosene or gasoline.

The steam-propelling system had these advantages:

1. Quiet running—no gears or chains in transmission.

2. Flexible as to speed by opening or closing a throttle.

3. The engine reversed easily.

4. There was a reserve of power, stored in the high-pressure steam and water in its boiler, that made it easy to start without auxiliary apparatus.

The objections to the system were:

1. The open or external flame, troublesome in high winds, dangerous as source of possible fire if the car were left alone with flame alight.

2. The pressure on the tank of fuel and the danger from a leakage under that pressure.

3. The time and delay in starting the vaporization of the liquid fuel when the car was cold.

4. The necessity for filling the water tank at comparatively short intervals of time or distance.

5. The lubricating oil which came from the engine to the condensing radiator and so into the water feed of the boiler.

or fourth cycle is the exhaustion of the cylinder as indicated on the accompanying diagram, which shows the successive stages in such an engine. The combustion is entirely inclosed or internal to the cylinder, hence the name internal combustion. (See INTERNAL-COMBUSTION ENGINE.) If fuel gas is delivered to such an engine it is a *gas engine*. (See GAS ENGINE.) If the fuel is a liquid hydrocarbon, such as gasoline, alcohol, or kerosene, a piece of apparatus is required to atomize the liquid and make it into a mist or fog and then completely to gasify it so that it may burn instantaneously and without smoke. Such a device is called a *carburetor* and is not only both an atomizer and vaporizer, but also a mixer, supplying the quantity of fuel needed and the air for its complete combustion and increasing the proportion of air as the motor speed increases. The carburetor is therefore expected to meet the following requirements:

1. It must proportion air and fuel.

2. It must mix them intimately.

3. It must proportion and mix under wide variations of car and engine speed and corresponding variations of pressure on the delivery side of the instrument.

4. It must mix and proportion under wide variations of power demand and under inverse variations of speed with power.

It must vaporize the liquid fuel under wide variations of temperature, and particularly for the first few strokes of the piston when the engine and carburetor are cold.

6. It must preclude flooding by excess liquid fuel, particularly after a run at speed, and above what the motor can assimilate in a few revolutions.

7. It must meet increased demand for speed promptly, and permit rapid acceleration from rest or after a slow-down.

8. It must operate successfully for the above requirements under variation in the quality and particularly of the volatility of the gasoline furnished to it.

The modern carburetor which seeks to meet these contradictory requirements has usually three inlets and one outlet, as illustrated by the type shown. The first will be the gasoline fuel intake. This takes gasoline from a storage tank, delivered either by gravity from a level above that of the carburetor or by a pressure of air or products of combustion greater than that of the atmosphere on the surface of the fuel in such storage tank. Excess flow to the carburetor is prevented by a float in the float chamber of the carburetor, which closes when a desired level is reached and in such case closes a needle valve in the fuel-supply pipe.

CARBURETOR.

The float-control idea was due to Maybach. The float may actuate the fuel valve directly or, more usually, through weighted levers, so that the rise and swaying of the car may not unseat the valve and flood the chamber. Inertia of the float and weighted levers may be made to neutralize such fluttering of the fuel valve. From the float chamber a passage leads to the jet nozzle, whose height is $\frac{1}{16}$ inch above the level the fuel in the float chamber. Any lowering of pressure at the nozzle will unbalance the pressure on the liquid, and the latter will flow through it into the moving current of air which surrounds it. The normal quantity of air for proportioning the mixture will enter through the second inlet orifice, usually fitted with a screen to keep dirt out. The flow of both fuel

and air will be determined to a degree by the lowering of pressure around the jet, and by proportioning the areas of cross section of the jet nozzle and the fresh-air inlet the mixture is kept somewhat as desired. But under great reductions of pressure caused by high speeds of the engine the quantity of fluid flowing will increase more rapidly than the needed air, owing to its greater mass and inertia. The easiest way to meet this difficulty is by an auxiliary or supplementary air valve held shut by a spring against light suction pressures, but opening progressively to admit more air as the engine speeds up and the pressure in the mixing passage grows less. The fourth orifice is the outlet to the engine. This is usually the passage to which the throttle valve is attached and which it controls. With the throttle closed or nearly so, the reduction of pressures in the cylinders is not so completely admitted to the carburetor passages, and hence the flow of mixture to the cylinders is under less difference of pressure. The friction past the throttle also prevents the compression in the cylinders from being as effective as when mixture flows freely to fill the cylinder on the aspiration stroke. Anything foreign which gets into the carburetor jet and closes it will stop gas making and the engine will stop. The air passing to the mixing passage is often led by a pipe from a jacket around the hot exhaust pipe to preheat the air for combustion. The carburetor is usually made with hollow walls in which the jacket water is circulated. This is to keep it warm in cold weather and to keep it from getting too hot in long runs. The carburetor often requires to be helped to a rich flow of mixture in starting by "tickling" or depressing the float so as to open the fuel valve and raise the level of fuel in the float chamber so as to produce an instantaneous excess of liquid at the fuel jet. Too much liquid or too "wet" a mixture ignites with difficulty if this process is overdone.

The internal-combustion engine for the motor vehicle offers the following advantages:

1. Light weight for the power it can develop.
2. Safety from fire.
3. Simple mechanism, not likely to get out of order.
4. Speed in starting.
5. Economy in fuel, because the motor is efficient.

The objections to the system are:

1. It is only efficient at one speed; hence gearing has to be introduced to meet the condition of heavy resistances at low speeds of car.
2. It turns only one way; hence a reversing gear must be added.
3. It does not start from rest by opening a throttle valve. One working stroke or more must be made by some external force, such as the human arm, an electric motor, or the energy in compressed air, or the cylinders must be primed by letting in a mixture of fuel and air compressed outside and sent into the motor by its pressure and fired before the motor has turned over.

4. The heat of combustion makes it necessary to cool the cylinders by circulating water or currents of air. This is necessary to enable the pistons to be lubricated and to prevent irregular firing or preignitions.

Objections Nos. 1 and 2 have been met and overcome by introducing a train of toothed gears between the motor and the driving wheels.

By introducing a clutch and a train of gears of different numbers of teeth it is possible:

1. To turn the motor and not propel the car.
2. To turn the motor fast and yet move the vehicle slowly.

3. To overcome the resistances due to inertia of the body and passengers in starting from rest and yet have the motor revolve at its best speed and with no danger of stalling.

4. To make possible the use of a much smaller cylinder volume (piston area multiplied by stroke) than would be required for starting from rest if there were no gearing. When the car is in motion, the motor has to overcome much less resistance than is met in starting.

5. To start the motor independently of the wheels by inserting an engaging and disengaging clutch in the transmission. This enables changes in the gear ratio to be made without inconvenient shock, and with much less effort than if the train of gears were always under stress.

6. To enable the car to coast with motor disconnected from drivers.

The clutch, the train of gears, and the differential gear at the rear axle may be generally called *the transmission*, because their function is to transmit the power and the motion of the motor crank shaft to the driving wheels which are in contact with the ground.

The clutch (q.v.) is a well-known mechanical device for engaging or disengaging a source of power from the machinery it is to drive. In the motor vehicle it is normally held engaged or in the driving position by a powerful spiral spring. It is disengaged so that the motor does not drive the car by compressing this spring by the action of a foot pedal (usually located so as to be operated by the left foot). Its function is to enable the motor to be started independently of the car, to have the motor disconnected from the wheels without shifting

SECTION OF TYPICAL CONE CLUTCH

gears while coasting or in traffic stops; to enable transmission-gear ratios to be changed without having to overcome the pressures on these gears due to the magnitude of the resistances being overcome. The slipping or flexibility of the clutch permits it to save the motor and the teeth of the gears from shock when the car meets a sudden resistance, as in a collision

or a hole in the road. Motor-vehicle clutches are of the friction type and usually of one or two varieties. The cone clutch has two conical contact surfaces, of which one will be pressed into the other by the spring above referred to. The hollow member (sometimes called the female part) will usually be found on the inner face of the rim of the flywheel of the engine.

SECTION OF TYPICAL DISK CLUTCH.

The male part can slide longitudinally on its shaft so as to go in or out of contact with the hollow or female part. The contact surfaces may be metal to metal or the face of the male element may be faced with leather. The other varieties are disk clutches, in which a series of alternating disks are borne, the odd members by the driving element of the clutch and the even members between the driving disks being attached to the shaft to be driven, so as to compel it to turn with them but capable of slight longitudinal motion thereon. The spring forces these alternate disks into contact by their faces; and by having enough of them, a sufficient contact area is secured so that one set will drive the other. The pedal movement antagonizes the spring, and the disks separate enough to disengage the driver and driven. This type of clutch was proposed by Weston. It engages more smoothly than the cone type, but is usually more sluggish in disengagement. The clutch was often interconnected to the hand brake of the car, so that if the brake was set the car could not be started. More recently this practice has been discontinued, particularly for heavy-grade work, so as to allow the motor to be used as a brake with the hand brake in series with it as an additional resistance.

The Gear Box. It is universal to inclose the train of gears for the changing of driving speed and for reversing in an oil or grease tight casing or box within which they may work free from grit and with minimum noise and complete lubrication. This gear box is a most important element in the transmission of speed and power, and is often called the *transmission*, of which it is properly only a part. The principle of the operation of a train of gears is that when a small diameter of gear drives a large one there is a gain of leverage

(often called power) with a loss of velocity. This is reversed when a large gear drives one of smaller diameter. For starting a car from rest the motor should turn at its usual speed or faster, while the driving wheels should turn slowly so as not to slip on the ground. Here then a small gear driven by the motor through the clutch should mesh into one of considerably larger diameter. So far as the mass of the body of the car is concerned the motor is working in *low gear*. There will usually be a second speed, faster than the low, and a third speed and a *high-speed* combination in four-cylinder cars. In six-cylinder cars there may be only three speeds, by reason of a greater flexibility of the motor on each gear. The gear box also embodies a second principle in transmission by gears; in a train of such external gears the odd members are revolving in one direction and the even members in the other. Hence by inserting a wheel between wheel number 1 and wheel number 2 so that the latter becomes number 3, the direction of rotation of the latter is reversed, and the motor driving gear number 1 will drive gear number 3 connected to the driving wheels in the reverse direction from that in which they turned when the driven gear wheel was numbered 2 in the train. The gear box is then said to provide for three (or four) speeds forward, and reverse. The gear for backing is always a slow and powerful combination. The high-speed gear is usually a *direct drive*; i.e., the change gears or back gears for gaining leverage in driving are out of mesh, and the shaft from the motor or clutch which enters the gear box is directly connected to the shaft which carries power out of the gear box to the driving wheels. Engagement or changing of gears in the gear box is effected by sliding the gears lengthwise on their axle, either squared or splined so as to allow lengthwise sliding but compel rotation of shaft and wheel. The teeth of the gear are so shaped at their ends that entry into gear is made easy and sure. The gears must not be turning at rates too different if this meshing is to be secured, and it is part of an operator's skill to make changes silently and without shock.

Planetary gears is a name given to a type of gear box now less usual than the sliding type, in which the transmission for each speed is effected by using one externally and one internally toothed wheel in the same plane of revolution, the two being connected together by a small pinion or by several small pinions borne or revolving upon studs. The studs for these connecting gears are borne upon a plate or disk concentric with the common axis of driver or driven gear, which is free to revolve when permitted to do so. When thus free the pinions revolve around the external driving gear as the planets revolve around the sun, and transmit no power or motion, and the concentric disk revolves also. When the disk is prevented from revolving by a brake band or otherwise, the pinions must transmit motion and power, because their axes are no longer free to rotate. Hence a transmission is effected, and the teeth of the gear are always in mesh. The type is heavy and cumbersome as compared with the sliding gear, and with the use of gears of alloy steel of high abrasive and other resistance in the latter, the need for continuous meshing has disappeared.

Friction Gear.—The variable speed for varying

resistances of the road has also been secured by applying what is mechanically known as the brush-wheel gear. This consists of a flat face or driving disk on the rear end of the engine shaft, against which is pressed by an adequate spring force a smooth-edged disk. The latter is covered on its contact circumference with leather or rubber or some similar slightly compressible material. The driven disk has its axis at right angles to that of the motor, and this driven disk can be pressed against the driving disk at varying radial distances from the axis of the latter. When the driven disk is

PROGRESSIVE SLIDING-GEAR SET.

Showing operation of change-speed gear-shift lever.

rotated by contact and pressure near the axis of the driving disk there is slow speed and power. When the driven disk is held and driven farther from the axis there is speed and less power. When the driven disk is moved past the centre of the driving shaft the driven disk turns in the reverse direction. By this system there is no meshing or sliding of gears, the increase or decrease of speed can be gradually made with or without limitation of steps in gear ratio; the gear-shift lever is also the clutch lever, or the clutch pedal of the other system, and is retained as a means of releasing the pressure of the disks against each other. The difficulty with the gear is that the driven disk must have a surface of some extent in contact with the driving face; and hence at only one plane of the former will the contact areas have the same linear velocity. Hence the contact material wears unevenly and the face of the driving disk wears into hollows where the driven disk runs most frequently and with the greatest contact pressure and with rings projecting between such hollows.

Shaft Drive Chain Drive. Worm Drive.—The power and the motion coming from the motor through the gear box are to be further transmitted to the rear or driving axle of the car. This may be done in one of two ways: the driven shaft in the gear box may be extended by what is called the *propeller shaft* and by means of flexible joints of proper construction made to operate a driving pinion in gear with a toothed wheel on the driving axle, or the driving may be

done by chains to sprocket wheels on the wheels themselves and independent of the rear axle. The first is called the *shaft-drive* system and is much in favor for light and medium-powered cars. The second is the *chain-drive* system and is generally preferred for heavy commercial vehicles which do not use the *worm drive*. The

worm gear gives compact and rapid reduction of speed and change of direction of motion, and is adapted for high rotative speed of the motor.

Propeller Shaft. Universal Joint. Cardan Joint.—The motor and the gear box are fastened to the frame of the car, so as to be borne upon the springs and to receive the benefit of

PLAN OF TOURING-CAR CHASSIS.
Showing shaft drive.

chain drive was the first system and offers the advantage of flexibility in yielding to distortions of the frame from inequalities in the road and obstacles met by one wheel only. The objections are the difficulties of protecting the exposed chains from mud and grit and of constructing protecting covers which shall be both effective and convenient. The shaft drive is clean, positive, mechanically simpler, and needs no troublesome lubrication. The chain drive requires a shaft parallel to the rear axle and carrying the driving sprocket wheels. This is called the *jackshaft* and is driven by a bevel pinion gear in the gear box. The shaft drive has no jackshaft, and eliminates weight.

Worm Drive—English practice in pleasure vehicles and American standards in motor-truck

elastic support of their weight. The jars and shocks which affect both axles and the spring-supported frame will cause different motions of both, and yet they must be connected mechanically, so that the motor may drive the axles under all loadings and vertical motions. This requires a *universal joint* at each end of the propeller shaft. This is a combination consisting of a diagonal cross-shaped piece of steel, to whose ends the driving and driven shafts are connected, each at right angles to the axis of the other. That is, if the driving shaft is connected to arms 1 and 3, the driven shaft will be connected to arms 2 and 4. Hence the angle between the centres of the driving and driven shafts can be varied within a considerable range and neither shaft be flexed by such

PLAN OF MOTOR-TRUCK CHASSIS

design make use of the screw drive or worm gear as a means of transmitting power from gear box to rear axle. (See **ENDLESS SCREW**.) The worm or screw is on the propeller shaft, and the end thrusts are borne by ball bearings. The worm wheel is at right angles to the propeller shaft on the axis of the rear axle. The

variation when the two shafts revolve. Such universal joint is used in compass mountings, and was first proposed by an Englishman named Hooke. It is also called a "Cardan" joint.

Differential Gear.—The space passed over in one or many revolutions by the circumferences of a pair of rear wheels of a car will be the

same when the car is moving in a lineal direction at right angles to their axis. In mathematical terms the axes of all four wheels intersect at an infinite distance. As soon as the car turns to move in a curve or arc of a circle of

as required. This is a very old mechanical device or movement and has been called the jack-in-the-box. The differential is usually carried

BEVEL AND DIFFERENTIAL GEARS.

finite radius, the wheels on the rear axle revolve on arcs of differing radius and hence of differing length for any angular motion of such axle. This will make one or the other of these wheels slip—usually the outer one, or one of longer path, since the inertia of the wheel as a whole helps motion in the direction it has to go. Such slipping, due to unequal track length, would wear the tires, waste propelling energy, and make hard riding. To correct it a provision is made, usually in the axle housing of shaft-driven cars or in the gear box of chain-driven cars, whereby this differential motion or difference in wheel path may be compensated for. The simplest arrangement is to provide that two, three, or four gears, bevel or spur, shall be planetarily mounted, so that their axes shall be borne in the body of the gear which received motion from the motor. These planetary gears mesh with two others, one being on the axle

VERTICAL TRANSVERSE SECTION OF FRONT HUB.

of the right wheel and the other on the axle of the left. When the resistance is equal at the tires of both car wheels, there is no motion around the axis of the intermediate gears. As soon as one driving wheel demands a shorter path than the other, these intermediate gears begin to revolve around their axes while still driving both axles, and compensate or give a differential motion to the two driving wheels

Note: All machine parts and apparatus located forward of the plane of section are shown by broken lines.

in an enlargement of the axle casing, and should be kept well supplied with oil or grease.

Steering Gear—The horse-drawn vehicle has the motor force connected to the front axle and at right angles thereto at all times. The motor car driven from the rear axle requires that the front pair of wheels be controlled by the driver. The principle of easy steering and control was first pointed out by Ackerman. Unlike the horse-drawn vehicle, where the axis of revolution of each of the front wheels is in the same line, in a motor vehicle each front wheel is mounted independently, so that in steering, its plane of revolution may be rotated about a vertical axis at either end of the front axle. This is secured by mounting the front wheel on a

CELLULAR RADIATOR Sectional view, showing structure

knuckle which is adjustable for position around a vertical pin borne in the forging of the front axle. These two knuckles are coupled together by a rod of sufficient strength which connects

to an arm on each, and these arms are so located as to converge slightly when the wheels are parallel. When these arms are moved laterally in the operation of steering, the wheels are made to depart from parallelism, the outer

all the shocks of the road which tend to swerve the front wheels. The steering-control wheel is borne in a hollow steering post, strongly attached to the frame. The steering knuckles, rods, and arms, and the teeth of the gears must

TYPICAL COOLING SYSTEM OF ENGINE.

wheel moving through a greater angle than the inner. Hence the Ackerman principle can be closely realized by very simple means. The early knuckles were connected to a lever or tiller when cars were light and speeds low. Modern control is by a wheel which turns a screw or

be massive enough not to break under shock and stress

Floating Axle Live Axle.—In the chain-driven cars the sprocket-gear toothed wheel will be a part of the running wheel, hence the rear axle need not turn in bearings. The bearings

worm, the latter meshing into a section of a worm wheel. The screw gear makes a transmission which is nearly irreversible, so that the driver does not have to resist with his muscles

will be in the wheel hub. Such an axle as must turn in order to drive the wheel will be called a live axle. In shaft-driven cars the weight of the car may be borne upon a hollow casing to

which the spring seats will be attached, and the driving axle may pass through the tubular casing out to the wheel hub without contact with the latter. The outer end of the axle is splined so as to compel the wheel to turn, but the axle is exposed to torsion stresses only. Such an axle as carries no bending stresses is called a *floating axle*, or a full-floating axle. A semi-floating axle is one in which the axle itself at its outer end is fitted to the weight-carrying bearings and is therefore exposed to transverse bending stress at its outer end.

The varying speeds and resistances of the motor vehicle make the four-stroke or Otto-cycle preferable to the Clark or two-cycle principle for motor-vehicle engines. (See INTERNAL-COMBUSTION ENGINE.) To secure uniformity of turning effort for the crank shaft and to balance the weights in motion about it, the four-cylinder single-acting design has been preferred, one cylinder being always in action to drive the shaft. The vertical cylinder axis makes the most convenient and accessible arrangement. Six cylinders arranged tandem give an overlapping of effort, so that as one becomes weaker in propelling effect another is just coming into action. Six cylinders have therefore a greater range of power before the gear-driving ratio needs to be altered, and make a more powerful motor on the high gears, but they use more fuel, and the car is proportionately heavier and with more parts. In some designs the cylinders are arranged with the axes at 45 degrees from the vertical, or as if were on the arms of a V, and this is often the arrangement where eight cylinders are employed.

The cylinders are cast in two blocks of four cylinders each, with water jackets, combination chambers, and intake manifold integral, and the two blocks are mounted on the crank case at an angle of 90 degrees to each other. The crank shaft has four throws, all in one plane, similar to that of a four-cylinder motor, excepting that each throw operates the two connecting rods from the pistons of the corresponding pair of opposite cylinders. One connecting rod of the pair is forked at the lower end, and the lower end of the rod fits inside the fork. The motors have a single cam shaft located directly above the crank shaft and operated by the latter through silent chain device. The cam shaft carries eight cams, each cam operating two valves on opposite cylinders. The valves are operated in pairs—four cams operating the eight intake valves and four cams operating the eight exhaust valves. The cylinders being of the L-head type, the intake and exhaust valves are all on the same side of the respective cylinder blocks. In firing the power stroke from a cylinder on one side is followed by a power stroke from a cylinder on the opposite side. The eight power impulses thus obtained during each complete cycle of two revolutions give a power impulse for every quarter turn of the flywheel, thus insuring a constant torque. The motor employs only one carburetor. It is provided

with two cooling water pumps, an oil pump, and a tire pump. In other respects, such as electric ignition, starting, and lighting, it is similar to other standard motors.

The older and standard designs of engines have lifting or poppet valves. These when worn

TYPICAL ELECTRIC POWER AND LIGHTING SYSTEM OF A MODERN HIGH-GRADE CAR.

STORAGE BATTERY AND LIGHTING CIRCUITS FOR REAR OF CAR.

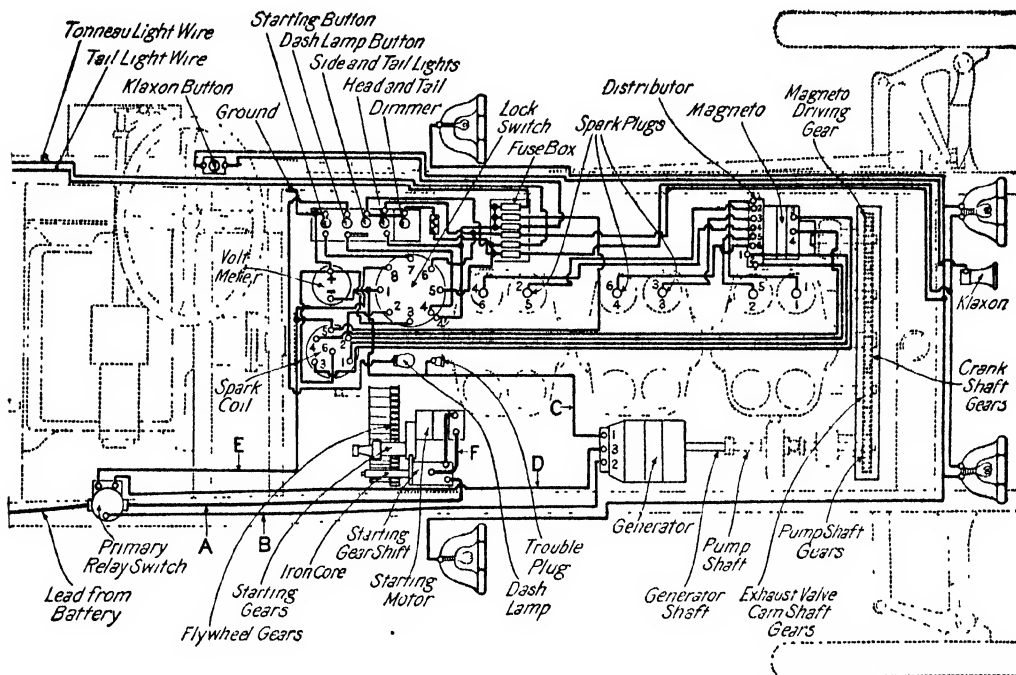

are easy to grind to their seat so as to be made tight and require no lubrication. Sliding sleeve, rotating cylindrical and conical valves are competing with the lifting type to diminish clearance losses and noise. They must be copiously lubricated, and the difficulties from a deposit of carbon on or near the sliding surfaces must be overcome, as well as a tendency to grow out of round by the continual action of heat. They cannot be reground when worn or scored.

To cool the water which circulates around the cylinders and valve chambers, a radiator is constructed to subdivide the circulating fluid into small currents and bring every channel into close contact with the air tubes. A driven fan keeps up an air movement more rapid than that of the car itself and increases the radiation. The control of the motor by spark and throttle is effected by levers on the steering post. Foot levers throw the clutch in or out, apply the brake, and control fuel supply in supplement to or substitute for the hand throttle or gas lever. The foot brake is often called the *service brake* and is powerful enough to lock the wheels. The hand brake is sometimes called the *emergency brake* and is to be available in case the foot brake fails in an emergency. It usually is fitted with a spring dog engaging into teeth on a sector, so that the brake can be locked on, holding the car even against the motor when the foot brake is released by the driver leaving his seat.

MECHANICAL STARTER

Self- Starter. The internal-combustion motor used on most motor vehicles requires that one or more strokes of the engine piston be made by some force external to such engine before the

a jaw clutch which worked in one direction only. A spring can also be used to start the motor, by having the motor wind it up to sufficient tension before the crank shaft stopped revolving before the stop. Latterly either the energy in compressed air stored by pumping it

TYPICAL ELECTRIC POWER AND LIGHTING SYSTEM OF A MODERN HIGH-GRADE CAR
GENERAL CIRCUIT CONNECTIONS FOR SELF-STARTER, LIGHTING SYSTEM, ETC

The battery is grounded on the positive side. A heavy cable lead connects the battery with the primary relay switch. Ordinarily this switch is open and no current can flow through the cable A beyond the switch. Current flows through the wire B and through the series field of the generator, out through the wire C to terminal 1 on the lock switch. The generator terminal 3 is so connected with an automatic switch on the generator that it has voltage only when the generator is not running or is running below 300 r p m. A wire D connects generator terminal 3 with a magnet coil in the primary relay switch. A wire E runs from the magnet coil to terminal 8 on the lock switch, through the switch and out from the terminal 7 to the starting button on the four-gang switch.

Starting the Engine. — When the starting button is pressed current flows along the wires D and E, through the lock switch and the starting button to the ground. The magnet in the primary relay switch closes the circuit, and current flows through the wire A to the starting gear shift, energizing a powerful electromagnet and passing through the wire F to the starting motor. The energized magnet pulls the iron coil inward against the pressure of a spring, thereby pulling the starting gear into mesh with the flywheel gear. A copper mushroom inside the switch base connects two copper fingers through a resistance in service with the starting motor, closes the main circuit to the motor, which cranks over the engine. When the engine starts firing the generator voltage builds up and opposes the battery voltage at the generator terminal 3. This allows the primary relay switch to open by the pressure of a spring contained therein, thereby cutting off the current flowing through the wire A and demagnetizing the electromagnet in the starting gear shift. This allows the spring to push out the iron coil, thereby pulling the starting and flywheel gears out of mesh.

Lighting Circuit Connections. — The lock switch terminals are connected as follows: 1 is connected to the battery and generator feed wire C, supplying the lighting system, 2 is connected to the terminal 2 on the spark coil, 3 is connected to the grounded side of the voltmeter, 4 is connected to the side and tail light bus on the four-gang switch, 5 is connected to the headlight terminal on the four-gang switch, and to the Klaxon, tonneau light, and ignition fuse bus, 6 is connected to the tail-light wire on the lamp side of the four-gang switch, also to the driver button operating through a 0.5-ohm resistance coil; 7 is connected to the side-light wires on the lamp side of the four-gang switch, 8 connects with the starting button on the four-gang switch, 9 is connected with the magnet coil in the primary relay switch. The lock switch has three positions. In the "on" position the starting gear shift and motor, all the lights, the Klaxon, and ignition circuits are disconnected and cannot be operated, while terminals 2 and 3 are connected, grounding the magneto. In the "night" position terminals 2 and 3 are connected, grounding the magneto, 5 and 6 are connected to the battery, allowing current to flow direct to the side and tail lights, so that they cannot be turned off by the buttons on the four-gang switch. All the other circuits are disconnected.

Ignition Connections. — Terminal 2 of the lock switch is connected to terminal 2 of the spark coil. The terminals 1, 2, 3, 4, are connected to the correspondingly numbered terminals on the magneto. The terminal 5 is connected to the primary relay switch, battery, and ground, 6, the centre post of the coil, is connected to the posterior side of the voltmeter, connected to lock switch terminal 3, which is the grounding terminal for the magneto. The high-tension cables are connected to the distribution terminals in the order of rotation 1, 2, 3, 4, 5, 6, the other ends of the cables go to the spark plugs in the order of firing, 1, 5, 3, 6, 2, 4.

cycle of operations can be restarted after a stop. The first method of doing this was by a hand-operated crank. This was so designed and installed that as soon as the motor took up its own functioning the hand crank was unlocked and thrown out of gear by a spring releasing

into a tank at 150 to 200 pounds' pressure per square inch has been applied, or an electric motor operated from a storage battery in the car can be similarly used. In compressed-air systems the pump is driven by the engine until the desired tank pressure is reached, when it

is disengaged. When the engine is to be started this compressed air is released through proper valves into one or more cylinders. The compressed air can also be used for inflating the tubes of pneumatic tires. The pump is lighter in weight than the electric motor of the other system, and the air tank lighter than the battery. In electric systems a pressure on a foot treadle first starts the motor slowly and then throws an engaging clutch into gear, turning the engine slowly until it begins to speed up under its own power. The clutch is then automatically disengaged so as not to turn the motor armature backward. A typical electric self-starting mechanism is shown in the accompanying figure. These devices should be called mechanical starters, but the term "self-starter" as applied to the engine which does not require hand cranking has been loosely applied to the starting device itself.

RUNNING GEAR AND SPRINGS

III. The third section of the subject is the running gear, wheels and springs. As the motor vehicle is the derivative of the motor tricycle, there has been a drift towards the use of three wheels at different times, but usually as a transition type. The three-wheeled vehicle is not so stable against overturning as the four, particularly on roads of high crown and deep ditches and on curves. The rubber-tired wheel with a pneumatic tube filled with compressed air consumes the least power and is easiest for the passengers. Commercial vehicles for slow speed and heavy loads have solid or cushioned tires. Six-wheeled vehicles for very heavy weights distribute the pavement load, and are made with the wheels either independent or fitted with compensating levers when four wheels of the six are drivers, as in the Dow system. Springs are flat and elliptic or semi-elliptic on pleasure vehicles and flat-leaved or locomotive platform type for heavy-load trucks. Brakes are in duplicate, so that failure of one pair will find the other pair in service. Usually one pair is foot-operated and one pair hand-operated, the latter arranged to lock the brakes when the vehicle is left standing. The brakes should be capable of locking the wheels on ordinary road surfaces and of retarding the motion of the car in less time than the adhesion of the clutch will allow it to be accelerated. The frames are of steel, usually of channel section, either plain or reinforced with wood. The steel channel is standard. Mud guards are attached over the wheels to protect both the body and its occupants.

RACING

Specially designed cars with abnormally high gearing for speed and much higher power than can be utilized in the ordinary vehicle have given very high speed records on special courses and tracks or on sea beaches where a hard surface can be secured. Regular race meets have been a commercial feature of recent years, both for the gate receipts and for the advertising value of success against competitors. They also give a hard tryout to the machinery and construction of the motor and running gear. Two of these meets are known as the race for the Grand Prix of the Automobile Clubs and the race for the Vanderbilt Cup. The Vanderbilt Cup Race in 1901 was held for the first time

over a special course on Long Island instead of on the highway. The winning machine, a 60-horse-power car with six-cylinder engine, made the 278 miles of the course in 4 hours, 25 minutes, and 42 seconds, or at an average speed of 62.8 miles an hour. At Ormond Beach in Florida during the last week of March, 1910, a 200-horse-power racer traveled 2 miles in 55.87 seconds, or at a speed of 128.89 miles an hour. On the same beach this car a few days previously made a mile in 27.33 seconds, or at a speed of 131.72 miles an hour. In 1908 the longest competition ever held, from New York to Paris, took place, and was won by an American car, which covered the distance of 12,116 miles in 112 days. For a racing road distance record the figures made at the Florio Cup Race in Italy, Sept. 26, 1908, of 327.8 miles in 4 hours, 25 minutes, and 21 seconds, or an average speed of 74.3 miles per hour, were the best on record up to 1910. Various accidents with loss of life have resulted in a general restriction of motor-car racing to special tracks or courses.

The manufacture of automobiles has become an important industry, the greatest work having been done in the construction of vehicles for touring and recreation, and for this purpose numerous factories have been established, both in the United States and in Europe. The value of automobiles produced in the United States in 1909, the latest census figures, was 730 million dollars against 532 million in 1904, and exceeded one billion in 1915. The exports grew from 10 million dollars in 1910 to 25 million in 1914. In 1915 the exportation was greatly increased, especially in trucks, which were greatly in demand for use in transportation during the European War. There are many clubs which arrange tours and races and seek to promote the construction of good roads and further the rights of the automobilists or the highway. For some years exhibitions have been held both in the United States and England and on the Continent to show the progress of the industry, and there is a growing literature, as well as a number of journals, devoted to the subject. The early history of steam vehicles, in common with that of other forms of steam engines, will be found in R. H. Thurston, *A History of the Growth of the Steam Engine* (New York, 1901). For a comprehensive descriptive treatise, consult W. W. Beaumont, *Motor Vehicles and Motors* (London, 1901), also R. B. Whitman, *Motor-Car Principles* (rev. ed., New York, 1909), Homans, *Self-Propelled Vehicles* (ib., 1912), F. A. Talbot, *Motor Cars and their Story* (ib., 1912), V. W. Page, *Modern Gasoline Automobile* (ib., 1914), H. P. Manley, *Modern Motor Car* (Philadelphia, 1914). See AUTOMOBILE, CYCLE CAR, MOTOR CYCLE, and Plates of FIRE ENGINE and FIRE PROTECTION.

MOTIL, mò-tiél'. A city and port of entry in south Spain, in the Province of Granada situated about 1 mile from the Mediterranean coast, 32 miles south by east of Granada (Map: Spain, D 4). There are ruins of old Moorish fortifications, but the greater part is well built with modern houses. Motil is chiefly an industrial town, has iron foundries, and manufactures sugar, spirits, chocolate, flour, soap, paper, cotton textiles, and pottery. The harbor is an exposed roadstead. Pop. 1900, 18,508; 1910, 18,444.

MOTT, ALEXANDER BROWN (1826-89). An American surgeon, son of Valentine Mott. He

was born in New York City and studied at University Medical College, New York, and the Vermont Academy of Medicine, Castleton, graduating in 1850 (M.D., University of Pennsylvania, 1857). Settling in his native city, he served as medical director there during the Civil War and from 1862 to 1864 was surgeon at the United States Army General Hospital. In the latter year he was ordered to the front as medical inspector of the Department of Virginia and was attached to General Ord's staff. In 1865 he was mustered out of service with the brevet rank of colonel. At Bellevue Medical College, which he had helped to found, he held the chair of surgical anatomy from 1861 to 1872 and from 1872 to 1889 that of clinical and operative surgery. He was the author of *Surgical Operations* (3 vols., 1856-57), *Advantages of Clinical Teaching* (1868), etc.

MOTT, JAMES (1788-1868). An American Abolitionist, born at Cowneck, Long Island, N. Y. Soon after completing his education he became a teacher in a Friends' boarding school in Dutchess Co., N. Y., where he met Lucretia Coffin (see MOTT, LUCRETIA), whom he afterward married. In 1810 he removed to Philadelphia and became a merchant. He early manifested his sympathy with the antislavery movement and was one of the first supporters of William Lloyd Garrison. He was one of the organizers of the Philadelphia National Antislavery Society in 1833, and in 1840 he was a delegate to the World's Antislavery Convention in London. There he took a prominent part in the agitation to admit women delegates and eight years later presided over the first national convention held in support of the woman's rights movement. In 1865-69 he was actively interested in the establishment of Swarthmore College by the Philadelphia Yearly Meeting, of which he was a member.

MOTT, JOHN R. (ALEIGH) (1865-). An American Y. M. C. A. leader and authority on foreign missions. He was born at Livingston Manor, N. Y., graduated from Cornell University in 1888, and in the same year became student secretary of the international committee of the Y. M. C. A. and chairman of the executive committee of the Student Volunteer movement. He became general secretary of the World's Student Christian Federation in 1895, foreign secretary in 1898 and associate general secretary in 1901 of the international committee of the Y. M. C. A., and chairman of the continuation committee of the World Missionary Conference in 1910. His lectures and conferences on Y. M. C. A. and mission work brought him large influence throughout the United States. Dr. Mott declined the presidency of Princeton University, to succeed Woodrow Wilson, and in 1913, when Mr. Wilson offered him the post of Minister to China, declined that also. Yale, Edinburgh, and Princeton gave him honorary degrees. Besides pamphlets and articles he is the author of *Strategic Points in the World's Conquest* (1897), *The Evangelization of the World in this Generation* (1900), *Christians of Reality* (1902), *The Pastor and Modern Missions* (1904), *The Future Leadership of the Church* (1908), *The Decisive Hour of Christian Missions* (1910, Ger. trans., 1911; 2d Ger. ed., 1912), *The Present World Situation* (1914).

MOTT, LEWIS FREEMAN (1863-). An American English scholar, born in New York

and educated at the City College (S.B., 1883) and at Columbia University (Ph.D., 1896). In 1884 he became a tutor at the City College and held that position until 1897, when he was made professor of English. He served as president of the Modern Language Association in 1911 and, in addition to various scholarly pamphlets, is the author of *The System of Courtly Love* (1894) and *The Provençal Lyric* (1901).

MOTT, LUCRETIA (COFFIN) (1793-1880). An American Abolitionist and woman's rights advocate, born on Nantucket Island. She was educated in the Friends' School at Nine Partners, near Poughkeepsie, N. Y., where she met James Mott (q.v.), whom in 1818 she married. She became prominent as a preacher in the Society of Friends and was chosen a minister. As a result of a visit to Virginia in 1818 she became an ardent advocate of emancipation. At the Separation of 1827 which divided the Society of Friends into two hostile factions, she and her husband adhered to the liberal or Hicksite party (See HICKS, ELIAS). In 1833 she attended as an invited guest the first convention of the American Antislavery Society, of which her husband was a member. Soon afterward she helped to organize the Female Antislavery Society, of which she continued one of the leaders until 1839, when it was merged in the men's organization. As the feeling against Abolitionists grew in intensity, many of the more timid Quakers began to deprecate any discussion of slavery by one of their ministers, and even in her own meeting she was regarded with suspicion and dislike. In 1840, at the World's Antislavery Convention in London, to which both James and Lucretia Mott had been chosen delegates, the question of the equal participation of women in the proceedings of the convention came up, and after some discussion all women were excluded. This action may be said to have started a movement for the emancipation of women from legal and political disabilities in the United States and England and, in a lesser degree, in France. It was then that Lucretia Mott and Elizabeth Cady Stanton first discussed the woman's rights movement, which they launched eight years later at a convention in Seneca Falls, N. Y. But these two movements, abolition and woman's rights, while they received the greater share of her attention, were not the only ones in which Mrs. Mott was interested, for all that promised to uplift humanity or to break the fetters of ignorance and tradition received her warmest support. Almost to the end of her life she made frequent journeys to visit distant meetings or to attend conventions called to consider the elevation of woman, the promotion of temperance, and the establishment of universal peace. Consult A. D. Halliwell, *The Life and Letters of James and Lucretia Mott* (Boston, 1884).

MOTT, VALENTINE (1785-1865). An American surgeon, born at Glen Cove, N. Y. He studied medicine at Columbia College and graduated in 1806, taking postgraduate courses in London and Edinburgh. In 1810 he was appointed to fill the chair of surgery at Columbia College, in which position he was continued after the medical department of that institution was united with the College of Physicians and Surgeons in 1813. In 1826 he was one of the founders of the Rutgers Medical College, which was disbanded four years later. He then returned to the College of Physicians and Sur-

geons, but resigned on account of failing health in 1835. After a prolonged stay in Europe he returned in 1841. In the same year he assisted in founding the New York University Medical College, whose president and professor of surgery he was until 1850. From 1850 to 1852 he again traveled in Europe. Mott was celebrated as a skillful operator in all branches of surgery and was the inventor of several valuable surgical instruments. He introduced an operation for immobility of the lower jaw and in 1821 performed the first operation for osteosarcoma of that member. He performed the operation of lithotomy 165 times and amputated more than 1000 limbs. Many foreign distinctions were conferred on him, and he was a member of many learned societies. He died in New York. His library of over 4000 medical works is now in the New York Academy of Medicine. He published an account of his first European journey in 1842, *Travels in Europe and the East*, and published also a translation of Velpeau's *Surgical Anatomy* and a volume of clinical lectures (1860). Among Dr Mott's essays may be mentioned: *An Experimental Inquiry into the Chemical and Medical Properties of the Static Limonium of Linnaeus* (1806); *Reminiscences of Medical Teaching and Teachers in New York* (1850); *Pain and Anæsthetics* (1862, 2d ed., 1863). Consult T. D. Gross, *Memoir of Valentine Mott* (Philadelphia, 1868).

MOTTA, mô'tá, JOSÉ VIANNA DA (1868-) A Portuguese pianist and composer, born on the island of St. Thomas, Gulf of Guinea. He studied at Lisbon, attended the Klindworth-Schajwenka Conservatory in Berlin, and was a pupil of Liszt at Weimar in 1885, of Schäffer at Breslau, and of Von Bülow at Frankfurt-on-the-Main in 1887. He made concert tours in Germany, Russia, Portugal, France, England, Brazil, Argentina, and the United States. Motta composed several songs and piano pieces, a symphony, and the cantata *Lusitaden*, and is the author of *Studien bei Hans von Bülow* (1896).

MOTTARONE, mô'tá-rō'ná, MOUNT A mountain in Italy on the west shore of Lake Maggiore (q.v.). It is 4892 feet high and is often called the "Rigi of North Italy." The view is magnificently extended. At one's feet lie Maggiore and six other lakes; across Maggiore, 60 miles to the southeast, may often be seen the cathedral of Milan, and to the north rise the Alps.

MOTTE FOUQUÉ, BARON DE LA. See LA MOTTE FOUQUÉ, F. H. K.

MOTTE-GUYON. See GUYON, J. M. B. DE LA MOTTE.

MOTTEUX, mô'tē', PETER ANTHONY (1660-1718). A French-English playwright and translator, born at Rouen in Normandy. He went to London on the revocation of the Edict of Nantes in 1685 and afterward opened a warehouse in Leadenhall Street, where he sold "tea, china, and Indian wares" (described in the *Spectator*, No. 552). In 1693 appeared Boileau's *Ode sur la prise de Namur, avec une parodie de la même ode par le Sieur P. Motteux*. Motteux mastered English in eight years, and in 1694 appeared one of the two works which made him famous. With Sir Thomas Urquhart and others he published in three volumes a translation of Rabelais (books i-iii), the remainder of which followed in 1768 (books iv-v). For the stage he wrote

comedies, masques, and operas. But his fame rests wholly on his Rabelais and on his admirable version of *Don Quixote*. Motteux died on Feb. 18, 1718, his birthday anniversary, in a brothel near St. Clement's Church. Though several persons were held for his murder, it is more likely that he died of disease.

MOTTEVILLE, mô'tvêl', FRANÇOISE BERTAUT DE (1621-89). A French writer, born at Paris. She was a member of the household of Anne of Austria, wife of Louis XIII, was exiled by Richelieu, but returned to court in 1642. She was devoted to the Queen and faithful to her to the very end. Her *Mémoires* are important because of the details of court life and the historical setting of the war of the Fronde (q.v.). They may be compared, for their keen insight into the manners and customs of the time, to the letters of Madame de Sévigné and the memoirs of the Cardinal de Retz (qq.v.). The *Mémoires* were translated by K. P. Wormeley (3 vols., London, 1902).

MOTTIER, mô't-îr', DAVID MYERS (1865-). An American botanist. He was born at Patriot, Switzerland Co., Ind., and was educated at Indiana University (A.B., 1891, A.M., 1892) and at Bonn (Ph.D., 1897) and Leipzig (1898). At Indiana University he was instructor in botany (1891-93), associate professor (1893-98), and professor after 1898. He served as president of the Indiana Academy of Science in 1907. His writings include *A Practical Laboratory Guide for First Year in Botany* (1902) and *Fecundation in Plants* (1904).

MOTTI, mô'tl', FELIX (1856-1911). An Austrian composer and musical conductor, born in Vienna. He studied at the conservatory there under Hellmesberger, Dessoff, and Bruckner and won a number of prizes. In 1881 he became court chapel master at Karlsruhe and conducted the philharmonic concerts till 1892. In 1886 he conducted at Bayreuth, and in 1893 he was appointed general musical director at Karlsruhe. Here his most noteworthy undertaking was the initial production at Karlsruhe of Berlioz's great two-part opera, *Les Troyens*. From 1903 until his death he held the position of general music director at Munich. During the season of 1903-04 he directed some performances at the Metropolitan Opera House. Although he had been engaged specially to conduct the first American Parsifal performances, he finally declined to direct that work, owing to the opposition of the Wagner family. He wrote the operas *Agnes Bernauer* (1880) and *Furst und Sanger* (1892), a festival play, *Eberstein*; a singspiel, *Pan im Busch*; and a string quartet. Together with H. Levi (q.v.) he completely reorchestrated Cornelius' *Barbier von Bagdad* (1884), and also edited Wagner's early overtures—*König Enrico*, *Polonia*, *Christoph Columbus*, *Rule Britannia*. Consult Erich Kloss, "Felix Motti," in *Monographien Moderner Musiker*, vol. iii (Leipzig, 1909).

MOTTO (It., a saying). In heraldry, a word or short sentence which forms an accompaniment to a coat of arms, crest, or household badge. Mottoes were originally the battle cries of the knights who used them. They were attached to the badge, when the family had one, or to the crest, when there was no badge. See HERALDEY.

MOTUCA (mô-tōo'ká) **FLY**. A gaddy (q.v.) which abounds in parts of Brazil and makes, in biting, a large and deep cut which may bleed considerably. As this fly (*Hædrus lepid-*

tus) sometimes settles in numbers on human beings, it is deservedly feared.

MOUBATA (mōō-bā'ta) **BUG**. See MITE.

MOUCHES VOLANTES, mōōsh vō'lānt'. See MUSCÉE VOLITANTES.

MOUCHEZ, mōōshéz', AMÉDÉE ERNEST BARTHÉLEMY (1821-92). A French naval officer and astronomer, born at Madrid. He studied in the French Naval Academy at Brest and served with distinction in the navy until 1878, when he succeeded Leverrier as head of the National Observatory. In 1880 he was made rear admiral. He had already shown himself an able and industrious scientist in the coast surveys of Brazil and Algeria and as organizer of the expedition to the island of St Paul to observe the transit of Venus in 1874. In his new post he greatly improved the equipment of the observatory, brought out a score of volumes of the *Annales* and a part of the catalogues listing all stars observed since 1838, and, above all, planned the international photographic chart of the heavens. He wrote: *Côtes du Brésil* (1864-74); *Rio de la Plata* (1873, 3d ed., 1891); *La photographie astronomique à l'observatoire de Paris et la carte du ciel* (1887).

MOUFLON, mōōf'lōn (Fr.). A wild sheep (*Ovis musimon*) now, and perhaps always, restricted to the islands of Corsica and Sardinia, where it is confined to the highest parts of the mountains. The rams stand about 27 inches high at the shoulders, carry immense horns, and have an abundant mane about the neck, shoulders, and breast. This mane is ashy gray, but the body is rusty red, lighter on the sides and stern, and with a dark line along the spine. The belly, sides of the tail, feet, and nose are white. The females are more dun-colored, so that they are almost invisible among the rocks. During the winter flocks of several hundred formerly gathered and ranged the mountains until spring, when they separated into family parties of three or four ewes and lambs, led by an old ram, but now large flocks are uncommon. The rutting season is in midwinter, the lambs—one or two at a birth—are produced in April or May. The animals have now become very wary and on that account offer most excellent sport to hunters. Consult books of European natural history and sport, especially Aflalo, *Sport in Europe* (London, 1901).

The term is sometimes extended to the aoudad (q v), and more especially to a slightly smaller sheep (*Ovis ophion*), with lighter horns, which is confined to the mountains of Cyprus and called the Cyprian mouflon.

MOUKDEN, mōōk-dēn'. The capital of Manchuria. See MUKDEN.

MOULD. See MOLD.

MOULDING. See MOLDING.

MOULE, moul, ARTHUR EVANS (1836-). An English missionary to China. He was the son of the vicar at Fordington, Dorset, and was educated at Malta College and the Islington Church Missionary Society College. In 1861 he went out to China, where he arrived in time to witness some of the stirring scenes of the Taiping Rebellion. He worked in the vicinity of Ningpo in 1861-69 and in 1871-76; at Hankow (where his brother had founded, in 1869, the first inland mission residence) from 1876 to 1879; in Shanghai in 1882-94; and, after eight years at home, in Chekiang and Kiangsu from 1902 to his retirement in 1910, having been Archdeacon in the diocese of Mid-China for 30 years.

In Chinese he published tracts, sermons, a commentary on the Thirty-nine Articles, "A Letter to the Scholars of China," etc.; and in English: *Chinese Stories* (1880); *New China and Old* (1891; 3d ed., 1902); *Half a Century in China* (1911); *The Chinese People: A Handbook on China* (1914).

MOULIN ROUGE, mōō'lān' rōōzh (Fr., Red Mill). A well-known dance hall on the right bank of the Seine in Paris, which, since the disappearance of the Jardin Mabille, has been one of the chief places of popular amusement.

MOULINS, mōō'lān'. The capital of the Department of Allier, France, on the Allier, 36 miles northeast of Montluçon (Map. France, S., II 2). It is a well-built town, with pleasant, beautifully shaded promenades and many places of interest, chief among them the Hôtel de Ville, with a magnificent library and valuable manuscripts, the cathedral of Notre Dame and its art treasures, the Archaeological Museum, the church of the Sacred Heart, and the Lycée. There are a seminary, two religious colleges, and a school of music. Industries include the manufacture of glassware, farm tools, paper, hats, oil, vinegar, cotton and woolen fabrics, and silk; there is an important trade in coal, wood, grain, and wine. Moulins was for a time the capital of Bourbonnais and the residence of the dukes of Bourbon, of the ducal castle, a fourteenth-century tower, now used as a prison, remains. Pop., 1901, 22,340, 1911, 21,990.

MOULMEIN, moul-min'. A city in Lower Burma. See MAULMAIN.

MOULTING. See MOLTING.

MOULTON, mōl'ton, FOREST RAY (1872-). An American astronomer, born at Le Roy, Mich. He graduated from Albion College (A.B., 1894) and from the University of Chicago (Ph.D., 1899), where he was associate in astronomy (1898-1900), instructor (1900-03), assistant professor (1903-08), associate professor (1908-12), and professor after 1912. He became an associate editor of the *Transactions of the American Mathematical Society* in 1907 and a research associate of the Carnegie Institution in 1908. Besides various contributions to mathematical and astronomical journals he is the author of *An Introduction to Celestial Mechanics* (1902; 2d rev. ed., 1914); *An Introduction to Astronomy* (1905); *Descriptive Astronomy* (1912); *Periodic Orbits* (1913).

MOULTON, JAMES HOPE (1863-). An English Wesleyan Methodist clergyman and philologist. He was born at Richmond College, where his father, Rev W. F. Moulton (q v.), was a professor. He was educated at King's College, Cambridge, entered the ministry in 1886, and was elected a member of the Legal Hundred in 1904. He was master at the Leys School, Cambridge, from 1886 to 1902, also lecturing on the classics at Girton and Newnham colleges; was a tutor at Didsbury (Wesleyan) College; and in 1908 became Greenwood professor of Hellenistic Greek and Indo-European philology in Manchester University. In 1911-12 he was dean of the theological faculty of the university. Moulton received honorary degrees from London, Edinburgh, Durham, Berlin, and Groningen. Besides contributions to periodicals and to Hastings' *Dictionary of the Bible* he is the author of *The Vision of Sin* (1898); *Two Lectures on the Science of Language* (1903); *Grammar of New Testament Greek*, vol. i (1906; Ger. trans., 1911); *Early Religious Poetry of*

Persia (1911); *Early Zoroastrianism*, the Hibbert lecture for 1912.

MOULTON, JOHN FLETCHER, BARON (1844-). An English jurist, brother of Richard Green and William Fiddian Moulton. Born at Madeley and educated at St. John's College, Cambridge, he became a barrister of the Middle Temple in 1874, queen's counsel in 1885, and served in Parliament in 1885-86, in 1894-95, and from 1898 to 1906. Moulton served as judge of the Court of Appeal from 1906 to 1912, when he became Lord of Appeal in Ordinary and member of the judicial committee of the Privy Council. In 1906 he was knighted and in 1912 was created a life peer.

MOULTON, (ELLEN) LOUISE (CHANDLER) (1835-1908). An American poet and story-writer, born at Pomfret, Conn., April 10, 1835. She was educated at Troy, N. Y., and before her twentieth year had edited *The Waverley Garland, a Present for All Seasons* (1853) and had written *This, That, and the Other* (1854). In 1855 she married William Moulton (died 1898), a Boston publisher and journalist. Repeated periods of residence in England, from 1876 on, made her lasting friends among leading English men and women of letters, and her Boston home was a favorite resort of literary talent. She died Aug. 10, 1908. Her published work includes the following titles: *Juno Clifford: A Tale* (1856); *My Third Book: A Collection of Tales* (1859); *Bedtime Stories* (1873); *More Bedtime Stories* (1874); *Poems* (1876), a notable volume, published (1877) in England as *Swallow-Flights; New Bedtime Stories* (1880); *Random Rambles* (1881); *Firelight Stories* (1883); *Ourselves and our Neighbors* (1887); *Miss Eyre from Boston, and Others* (1889); *In the Garden of Dreams: Lyrics and Sonnets* (1889); *Stories Told by Twilight* (1890); *At the Wind's Will* (1899). Mrs. Moulton edited the poems of Philip Bourke Marston (1892) and of Arthur O'Shaughnessy (1894). A collection of her verse—*Poems and Sonnets* (1900)—includes an introduction by H. P. Spofford.

MOULTON, RICHARD GREEN (1849-). An American educator and literary critic, brother of John Fletcher and William Fiddian Moulton. Born at Preston, England, he was educated at London University (B.A., 1869), at Christ's College, Cambridge (M.A., 1877), and at the University of Pennsylvania (Ph.D., 1891). He was university-extension lecturer to Cambridge (1874-90), to the American Society for the Extension of University Teaching (1890-91), and to the London Society (1891-92). Moulton became professor of literature in English at the University of Chicago in 1892 and in 1901 professor of literary theory and interpretation and head of the department of general literature. His works include: *Shakespeare as a Dramatic Artist* (1885); *The Ancient Classical Drama* (1890); *Four Years of Novel Reading* (1895); *The Literary Study of the Bible* (1896; 2d ed., 1899); *A Short Introduction to the Literature of the Bible* (1901)—the last two being supplementary to the *Modern Reader's Bible*, edited in 21 volumes in 1895-98 and republished in 1 volume in 1907; *The Moral System of Shakespeare* (1903), republished as *Shakespeare as a Dramatic Thinker* (1907); *World Literature and its Place in General Culture* (1911); *The Modern Study of Literature* (1915). In the *Modern Reader's Bible*, Moulton, with rare insight into and appreciation of

the significance of the text from a literary standpoint, arranged the various books in accordance with modern English usage, as prose narrative, dramatic dialogue, lyric verse, or whatever form seemed appropriate.

MOULTON, WILLIAM FIDDIAN (1835-98). An English Wesleyan Methodist clergyman and educator, brother of John Fletcher and Richard Green Moulton and father of James Hope Moulton. He was born at Leek and was educated at Woodhouse Grove School, at Wesley College, Sheffield, and at London University, where he graduated in 1856 and was prize medalist in mathematics and natural philosophy. In 1858 he entered the ministry and in 1872 was elected to the Legal Hundred. He was assistant tutor and classical tutor in Richmond College between 1868 and 1874, when he founded and became the first head master of the Leys School at Cambridge. This position he retained until his death. He was a member of the New Testament Company on the revision of the Scriptures (1870-81), was elected president of the Wesleyan Methodist Conference (1890), from 1873 until his death was secretary of the committee for the examination of the preachers on trial, and in 1891 was a member of the Ecumenical Methodist Conference held at Washington, D. C. He translated and enlarged Winer's *Grammar of New Testament Greek* (1881), with A. S. Geden compiled *A Concordance to the New Testament Greek* (1897), and contributed the comments on the Gospel of John to *The International Revision Commentary* (1879). Consult *William Fiddian Moulton: A Memoir*, by W. Fiddian Moulton, with a chapter by James Hope Moulton (New York, 1899).

MOULTRIE, mōl'trī. A city and the county seat of Colquitt Co., Ga., 140 miles south of Macon, on the Atlanta, Birmingham, and Atlantic, the Flint River and Northeastern, the Georgia and Florida, the Valdosta, Moultrie, and Western, and the Georgia Northern railroads (Map: Georgia, C 4). It is a commercial and manufacturing centre, has a meat-packing plant, and produces naval supplies, mattresses, fertilizers, lumber, wool and cotton mill products. The city contains a Carnegie library and a fine government building and owns its water works and electric-light plant. Pop., 1900, 2221; 1910, 3349.

MOULTRIE, FORT. See FORT MOULTRIE.

MOULTRIE, JOHN (1799-1874). An English poet and clergyman, and rector at Rugby in Thomas Arnold's time. Born in London, educated at Eton and at Cambridge, he was ordained in 1825 and was presented by Lord Craven with the living of Rugby. His friendship with Dr. Arnold is recorded in his poetry, which, in the midst of much that is dull, contains some popular poems—e.g., "Godiva" and "My Brother's Grave"—and several hymns which, in point of poetic quality, are well above most productions in that kind. His poems—originally appearing in several separate volumes—were completely collected in two volumes in 1876.

MOULTRIE, mōl'trī or mōl'trī, WILLIAM (1731-1805). An American soldier, prominent in the Revolutionary War. He was born in Charleston, South Carolina, received an ordinary education, and in the Cherokee troubles of 1761 was a military captain. In 1775 he was the representative of St. Helena Parish in the South Carolina Provincial Congress and later

MOUND-BUILDERS

MOUND, ADAMS COUNTY, OHIO

CIRCULAR EARTHWORK, OHIO

in the same year was chosen colonel of a South Carolina regiment. For the defense of Charleston he placed a battery at Haddrell's Point and (March, 1776) began the erection of a rude fort of palmetto logs on Sullivan's Island. This fort commanded the entrance to the harbor and on June 28 was fiercely but unsuccessfully attacked by Admiral Sir Peter Parker. Moultrie had undertaken the defense against the advice and wish of his superior officer, Gen. Charles Lee. For his success he received the thanks of Congress, and in his honor the fort was named Fort Moultrie. In September of the same year he was made a brigadier general and was put in command of the Department of Georgia and South Carolina. He defeated the British under General Gardner at Beaufort in February, 1779, and, by obstructing the advance of Prevost in May, enabled Charleston to prepare for its defense, finally entering the city and holding chief command until the arrival of General Lincoln. On the surrender of Charleston in May, 1780, he became a prisoner, but in February, 1782, he, with several others, was exchanged for Burgoyne. He was made a major general in October of that year and subsequently was twice (in 1785 and in 1794) elected Governor of South Carolina. He retired to private life after his second term and died at Charleston, Sept. 27, 1805. His *Memoirs of the Revolution as Far as it Related to the States of North and South Carolina* (2 vols., 1802) was written in part while he was a prisoner and was finished in later years.

MOUND BIRD. The mound birds are a group of gallinaceous birds, with feet like those of pigeons in not having the hallux raised above the other toes, and related to the American curassows. (See CURASSOW.) They form a family, the Megapodidae, which, as is indicated by the name, are characterized by the possession of unusually large feet. Although the family contains two subfamilies, the mound birds proper or, as they are called in Australia, jungle fowl, and the brush turkeys (see BRUSH TURKEY), all these birds agree in the remarkable habit which has given them their widely known name. This habit is the building of a huge mound for a nest, within which the eggs are left to be hatched by heat caused by the decay of vegetable matter within the heap. These mounds vary greatly in size and shape as well as in manner of construction, and in the number and arrangement of the eggs which they contain. The simplest are where the birds excavate a hole in the sand in which the eggs are laid, and are then covered with a mixture of sand and vegetable matter. Such is the habit of the lowan, or mallee bird (*Megacephalon maleo*), of Celebes. In most cases, however, the birds scratch up grass, leaves, turf, etc., and with their large feet throw this material together in a heap. The female digs down into such a heap from the top and lays an egg, which is so placed that it is nearer the outside than the top of the mound. Just how the young escape from the mound when the egg hatches is still uncertain, but it is probably by digging through to the side. The young are well developed, feathered, and able to fly as soon as they leave the mound. The number of eggs laid by each female is still a matter of doubt, from 4 to 20 are found in each mound, and there is no doubt that several females often lay in the same heap. The eggs are white when first laid, but soon become stained by the vegetable matter

in which they lie. They are remarkably large for the size of the bird and are ellipsoidal rather than oval; they measure from 3 to 4.3 inches in length, according to the species. The birds resort to the same mound season after season, but add fresh material at every egg-laying time; consequently the mounds increase with age and may be in use for many years. They are usually more or less truncatedly conical or crater-like in form, but may have one of the horizontal diameters much longer than the others. The largest one on record was reported to be about 50 feet in diameter and some 14 feet high.

The mound birds themselves are plainly colored and vary in size from a small fowl to a small turkey. They are shy and retiring and are not often seen. They frequent scrub and undergrowth along the seacoast or on the banks of streams emptying into the sea. The mounds are built in open spaces in the thick scrub or on unfrequented parts of the shore. The birds fly little and heavily and are not easily flushed, but sometimes seek shelter in trees. They are said to be noisy at night and to have hoarse call notes which they use during the day. All the Megapodidae are inhabitants of the Australasian region and are not found north of Celebes; the majority of the species are Australian. The one best known on that continent is the scrub hen, or mound turkey, of Queensland (*Megapodius tumulus*). Another smaller one is the leipoa (*Leipoa ocellata*). The brush turkeys of New Guinea and neighboring islands belong to the genus *Tallegalus*.

Consult Gould and other authorities on the ornithology of Australia. (See BIRD.) See also Campbell, *Nests and Eggs of Australian Birds* (Sheffield, 1900), and id., "Mound-Building Birds" (with photographic illustrations of mounds), in *Bird Lore*, vol. v (New York, 1903).

MOUND BUILDERS. Specifically, a hypothetical race or people at one time supposed to have antedated the Indian tribes as inhabitants of the Ohio and Mississippi valleys; but the mound builders of the Mississippi valley are now regarded merely as the ancestors and representatives of the tribes found in the same region by Spanish, French, and English pioneers. The custom of erecting mounds has been widespread; most primitive peoples are known to have erected mounds either habitually or in some stage of their development. Most of the mounds of the typical regions in central North America are mortuary or sacrificial. The chief contents are skeletons, with ceremonial and other objects buried with the bodies, while the structures are wholly of earth; in a few cases houselike structures form the nucleus of the mound. See ARCHÆOLOGY, AMERICAN, SEPULCHRAL MOUND.

MOUND CITY. A city and the county seat of Pulaski Co., Ill., 8 miles north of Cairo, on the Ohio River and on the Cleveland, Cincinnati, Chicago, and St. Louis Railroad and a branch of the Illinois Central (Map: Illinois, F 11). It has a trade in lumber, shipbuilding interests, and manufactures of lumber, veneer, heading and hoops, etc. In the national cemetery here are 5310 graves, 2732 of unknown dead. Pop., 1900, 2705; 1910, 2837.

MOUNDSVILLE. A city and the county seat of Marshall Co., W. Va., 11 miles south of Wheeling, on the Ohio River and on the Baltimore and Ohio Railroad (Map: West Virginia, D 2). It is the seat of the State penitentiary

and has a fine courthouse, Federal building, Reynolds Memorial Hospital, and a famous relic of the mound builders, a massive structure of conical form, after which the city was named and in which two burial vaults containing skeletons and copper ornaments were discovered by excavations of 1838. The city is in an agricultural and coal-mining region, has important commercial interests as a result of its shipping facilities, and extensively manufactures glass, lumber products, enameled ware, bricks, lamps, metal ceilings, brooms, whips, clothing, cigars, grain cradles, flour and feed, foundry products, leather, etc. The government is vested in a mayor, elected every two years, and a unicameral council. Pop., 1900, 5362; 1910, 8918; 1914 (U. S. est.), 10,433.

MOUNET, mōō'nā', (JEAN) PAUL (1847-). A French actor, brother of Jean Mounet-Sully. He was born at Bergerac, Dordogne, became a doctor of medicine, and first appeared on the stage in *Horace* at the Paris Odéon (1880). It was in 1880 that he first played at the Comédie Française, of which he became sociétaire two years later. Mounet gained his reputation in *Les Erynnies*, *L'Arlésienne*, *Othello*, *Patrie*, *Hamlet*, *La Furie*, *Anthony*, *Le Roi*, *L'Enigme*, *Le Dédale*, and *Edipe Roi*. He served also as a professor at the Paris Conservatoire and became Chevalier of the Legion of Honor.

MOUNET-SULLY, su'lé', JEAN (real name, JEAN SULLY MOUNET) (1841-1916). A French tragedian. He was born at Bergerac and at 21 entered the Conservatoire. After beginning his career at the Odéon (1868) he served in the Franco-Prussian War and in 1872 made his début at the Théâtre Français. Admirably gifted by nature, he became famous for the power and passion of some of his impersonations. His successes were both in classic repertoire and in more modern plays: *Andromaque*, *Le Cid*, *Iphigénie*, *Phèdre*, *Zaire*, *Hernani*, *Ruy Blas*, *Antigone*, *Othello*, *Marion Delorme*. Perhaps his most notable achievement, however, was his production of *Edipe Roi* in the fêtes at the old Roman Theatre of Orange, a performance repeated in Paris at the Théâtre Français (1888) and some years later in New York. His Hamlet also counts among his most serious efforts. He wrote, with Barbier, the drama *La vieillesse de Don Juan* (1906), in which he assumed the title rôle. Consult Brander Matthews, *The Theatres of Paris* (New York, 1880).

MOUNIER, mōō'nyā', JEAN JOSEPH (1758-1806). A French politician and author, born in Grenoble (Isère). He became judge at Grenoble in 1783, secretary of the estates of Dauphiné in 1788, and in 1789 was elected deputy to the States-General. There he unsuccessfully advocated the system of two legislative chambers, a subject which he also expounded in his *Considérations sur les gouvernements, et principalement sur celui qui convient à la France* (1789). He was elected President of the National Assembly in 1789, but soon afterward resigned because of the decision to remove the Assembly to Paris. He withdrew to Switzerland and thence to Weimar, published his *De l'influence attribuée aux philosophes, aux franc-maçons et aux illuminés, sur la révolution de France* (2d ed., 1828), and in 1801 returned to France, where Bonaparte appointed him Prefect of Ille-et-Vilaine (1802) and Councilor of

State (1805). His further publications include *Recherches sur les causes qui ont empêché les Français de devenir libres* (1792). Consult De Lanzac de Laborie, *Un royaliste libéral en 1789: Jean Jos Mounier* (Paris, 1887).

MOUNT, FOR GUNS. See COAST ARTILLERY; GUNS, NAVAL, ORDNANCE.

MOUNT, WILLIAM SIDNEY (1807-68). An American genre and portrait painter. He was born at Setauket, Long Island, and studied at the National Academy, New York, of which he was made a member in 1832. His first works to gain repute were the "Daughter of Jairus," exhibited in 1828, a full-length portrait of Bishop Onderdonk, and a number of clever children portraits. It was not until the exhibition of "Husking Corn" that his special talent for genre painting was recognized. Mount was the forerunner of a whole school of genre painters. His scenes are sympathetically composed and his figures well drawn and natural, he had a keen eye for humor and was one of the first Americans to portray the negro character successfully. Among his best paintings are "Bargaining for a Horse," "The Fortune-Teller," and "The Truant Gamblers," all in the New York Historical Society. "Raffling for a Goose" (1837), Metropolitan Museum, New York. "A Long Story" (1837), Corcoran Gallery, Washington; "Coming to the Point," Public Library, New York.

MOUNTAIN (OF. *montaigne*, *muntaigne*, Fr. *montagne*, from ML *montanca*, *montana*, mountain, from Lat *montanus*, mountainous, from *mons*, mount). A term somewhat loosely used for a high prominence on the earth's surface with steep slopes. The distinction between mountain and hill is merely one of size. A plateau is distinguished from a mountain by its broader top and sometimes by its gentler slopes. Where a mountain forms a linear elevation it is called a range, ridge, chain, or sierra. Where the ridges are grouped in parallel lines, or *en échelon*, the groups are called mountain chains, systems, or cordilleras. These terms are sometimes given more precise meanings. *Mountain ridge* is sometimes confined to a series of parallel ranges, all of which were formed within a single geosyncline or on its borders. *Mountain system* is applied to a number of parallel or consecutive ranges formed in separate geosynclines of approximately similar dates of upheaval. *Mountain chain* is applied to two or more systems of the same general region of elevation, but of different dates of origin. *Cordillera* is applied to several mountain chains in the same part of the continent. Most of the names applied to parts of mountains explain themselves. Crest, peak, knob, pinnacle, needle, valley are familiar to all. A gorge or cañon or clove is distinguished from a valley by its steep slopes and narrow bottom, a park is a broad valley, a col or saddle is an exceptionally low point in a crest; a cirque is a steeply walled, outward facing amphitheatre near the crest of the range.

Types and Origin of Mountains. Mountains are formed (1) by uplift, (2) by circumdenudation or land sculpture, and (3) by eruptive agencies; and mountains formed in these three ways have characteristic and distinguishing forms.

1. By far the larger number of mountains due to uplift are in the form of folds or wrinkles in the earth's crust. These folds take

on a great variety of form and arrangement. Usually a number are parallel, but not coextensive in their longer directions, lapping by one another *en échelon*. They may be upright or overturned at various angles. They may be

FAN STRUCTURE, ALPS

compressed along the limbs and spread out at the crest in such a way that the strata on both sides of the axial plane of the fold dip towards this plane, a type of folding called the fan fold, sometimes the Alpine structure, because of its excellent development in the Alps. On the major folds with this variety of attitude may be imposed smaller folds, just as smaller waves are superimposed on the greater waves of a body

SYMMETRICAL FOLD, JURA MOUNTAINS.

of water. Again, the folds are themselves folded in directions transverse to their longer directions. Examples of mountain systems representing folds of the earth's crust are the Alps, the Jura, the Appalachian system, the Coast Ranges, and most of the Rocky Mountains.

Another type of uplift is shown in the Basin Ranges of Nevada, Idaho, Arizona, and New Mexico and is known as the Basin Range structure. Here the uplift is not accompanied by

FAULTED STRUCTURE, BASIN RANGE.

any horizontal compression. The rocks apparently have been uplifted vertically in great blocks owing their outlines to joints or faults, while others remain stationary or go down. Not infrequently a series of such blocks is tilted in a monoclinical manner, corresponding edges of different blocks going up and the opposite edges going down, the elevated edges thus making mountains and the depressed edges valleys.

Still another type of uplift is shown in the Uinta Mountains of Utah, where a great mass of

BROAD ARCHED FOLD, UINTA MOUNTAINS.

rock has been lifted vertically above the adjacent rocks with only a gentle arching.

Two theories have been proposed to explain mountains of the fold type—the so-called gravitation theory and the contraction theory. It has been observed that mountains formed by

folding or faulting are for the most part composed of great thicknesses of sediments which were deposited in the same general geosyncline, i.e., in the same great depression of the earth, or perhaps which were deposited in areas which became geosynclines owing to subsidence of the area under the weight of the sediments. It is supposed that the load of sediments may cause the isogeotherms to rise, i.e., causing the rocks at a certain level to have a higher temperature than they otherwise would have. This, perhaps combined with the injection of igneous rocks, which are sometimes observed to occur in such areas, causes the rocks to expand, resulting in folds or mountains. To this there are a number of objections. The expansion possible by this cause is not sufficient to explain the amount of folding observed, and furthermore it does not explain the occurrence of the folds in parallel ridges. The contraction theory is briefly this: The cooling of the earth is proceeding more rapidly in the interior than at the cool exterior. This causes more rapid contraction of the interior than of the exterior, and the crust, in its tendency to make itself smaller in order to fit the smaller nucleus, becomes wrinkled and corrugated. The wrinkles become located along points of weakness. These are likely to be under the geosynclines near the continental lands where great sedimentation has occurred, where, as above seen, the temperature is supposed to be higher.

2 When an area is elevated above the sea, the natural forces of erosion, wind, water, changes of temperature, etc., begin their attack upon the land and slowly cut it down, the waters collecting in rills, brooks, and rivers, cutting small and large valleys with a variety of forms and distribution due to the varying hardness and the structure of the materials cut through. If carried far enough, this process will ultimately bring the elevated area to sea level. At certain stages in the process certain areas, because of their hardness or structure, may stand high above the surrounding areas which have been worn away and may be called mountains. In so far as mountains have already been formed, by folding and elevation, subsequent erosion only modifies their shapes, but where uplift has not left the land in mountain form, subsequent denudation may bring it into this point. Mountains formed or modified in this way have a variety of shapes. When the strata are horizontal, a hard layer at the top may resist erosion sufficiently long to make the mountain a flat or table-top mountain. Hard volcanic material about a volcano may resist erosion more than the surrounding material and the area thus stand as a lava-topped mountain. The mesas and buttes of the Great Basin region of the United States illustrate the effects of erosion upon rocks of different hardness. If the strata are much folded, erosion cuts down along lines of least resistance, usually following the softer strata, leaving the edges of the harder ones as ridges. This state of affairs appears in the Appalachian system, a system owing its present features to folding and elevation combined with differential denudation along softer layers.

3. Mountains formed by eruption of igneous rocks are of common occurrence. Volcanic mountains formed by lavas occurring either singly or grouped in lines are well known. Vesuvius, Rainier, Hood, St. Helen's, Lassen

and Shasta are examples of these. The volcanic materials may be so grouped as to form an upland of considerable extent, as the Cascade Range. Eruptions of igneous rocks which never reach the surface also form mountains by bulging up the strata above them. Going upward towards the surface they find it easier at a certain point to spread out in a globular form (called laccolite), arching the strata above them, than to break through the overlying strata and come to the surface. The mountain thus formed is a dome with a nucleus of igneous material, which latter may be afterward exposed to view by erosion along the crest of the arch. The Henry and Huerfano mountains of the western United States are of this type.

Mountains and Climate. Mountains fulfill important uses in the economy of nature, especially in connection with the water circulation of the world. They are at once the great collectors and distributors of water. In the passage of moisture-charged winds across them the moisture is precipitated as rain or snow. When mountain ranges intersect the course of constant winds and abstract the moisture, they produce a moist country on the windward side and a comparatively dry and arid one on the leeward. This is exemplified in the Andes, the precipitous western surface of which has a different aspect from the sloping eastern plain, and so also the greater supply of moisture on the southern sides of the Himalayas brings the snow line 5000 feet lower than on the northern side. Above a certain height the moisture falls as snow, and a range of snow-clad summits would form a more effectual separation between the plains on either side than would the widest ocean, were it not that transverse valleys are usually of frequent occurrence, which open up a pass, or way of transit, at a level below the snow line. Some ranges, like the Pyrenees and the Caucasus, are practically impassable except near their ends. Mountains also show considerable vertical variation in their life and climate zones. It is well known that, other things being equal, the air is one degree cooler for every 300 feet of ascent, and also that the rate of precipitation increases upward. At a certain elevation rain gives way to snow. Corresponding to these varying conditions of temperature and moisture is the distribution of the vegetation, which is commonly in well-defined zones, each zone distinguished by its species from the zones above and below. Near the top of many mountains the vegetation ends altogether, and the peaks are absolutely barren, the limit being reached more rapidly in cold than in warm climates.

Age of Mountains. The age of most folded mountain systems has been determined by the structure of the sediments of known age which compose them, and their relation to other sediments of known age. For instance, the Appalachian system of the eastern United States, composed mainly of Paleozoic rocks, is much contorted, while rocks of Mesozoic age rest against this mountain system in relatively undisturbed layers. It is clear that the main uplift of the mountain system followed the deposition of the Paleozoic rocks and preceded that of the Mesozoic rocks. The age of volcanic mountains is determined by the relations of the volcanic materials of surrounding sedimentary rocks of known age. The mountain systems of the world were formed at various times. Some of them have represented areas of weakness

where several mountain-making movements have occurred, as in the Rockies, Pyrenees, Alps, Jura, and Himalayas. Others have been cut down by denudation to their very roots and do not now appear as mountains. The greatest and loftiest mountains of elevation have for the most part received their main uplift in comparatively recent geological times.

MOUNTAIN, GEORGE JEHOSEPHAT (1789-1863). A Canadian Anglican bishop, son of Jacob Mountain. He was born in Norwich, England, was educated at Cambridge, and, having gone to Canada, was in 1813 ordained priest. After filling pastorates at Fredericton, N. B., and Quebec, he became Archdeacon of Quebec in 1821 and in 1836 Bishop, with the title of Bishop of Montreal. Shortly afterward the Bishop of Quebec retired, and Mountain took entire episcopal charge of the two provinces until 1839, when Upper Canada was made a separate see. In 1849-50 through his efforts the dioceses of Rupert's Land and Montreal were established, and he became Bishop of Quebec, retaining the position until his death. He founded the Church Society in Canada, and Bishop's College, Lennoxville. He published *The Journal of the North-West American Mission* (1845, 2d ed., 1849), *Songs of the Wilderness* (1846), a book of poems, and several sermons. Consult A. W. Mountain, *A Memoir of George Jehoshaphat Mountain* (Montreal, 1866).

MOUNTAIN, JACOB (1750-1825). The first Protestant Bishop of Quebec. He was born in the County of Norfolk, England, was educated at Cambridge University, and was afterward ordained a priest of the Church of England. He held livings in Norfolk, Huntingdonshire, and Lincolnshire (1781-93) and in the latter year was made Bishop of Quebec. In 1792 Canada was divided into two provinces, Upper and Lower Canada. There were only six Anglican clergymen in the former province and three in the latter, but Mountain took episcopal charge of both provinces and by great energy and devotion during 32 years became the founder of the Anglican church in Canada. He built churches, extended missions, and also gave his services in a judicial and executive capacity at a time when the British régime was being organized in Lower Canada.

MOUNTAIN, THE. The name of a political faction in the French Revolution. See MONTAGNARDS.

MOUNTAIN, or PACK, ARTILLERY. Field artillery in which the gun and all its equipment and ammunition are habitually transported on the backs of animals, instead of being drawn on wheeled carriages. The desirability of having a gun of large calibre (usually 3-inch)

MOUNTAIN ARTILLERY

UNITED STATES ARMY THREE-INCH MOUNTAIN HOWITZER PACKED ON MULES AND READY FOR THE FIELD

The five packs represent the distribution of the load of one gun

MOUNTAIN ARTILLERY

1. UNITED STATES ARMY MOUNTAIN BATTERY EQUIPPED FOR FIELD SERVICE
2. 2.95-INCH VICKERS MAXIM MOUNTAIN GUN (ENGLISH). Used in United States Army until replaced in 1915 by 3-inch Mountain Gun of Ordnance Department. Gun in action. Note wheels in the air

available in difficult country inaccessible to wheeled transportation led to the invention and development of the modern mountain gun. The more accurately descriptive term is *pack* artillery, for the reason that such guns are frequently used in country which is not mountainous, but difficult from some other cause, e.g., on account of lack of trails, thick undergrowth, marshes, etc. Like all other field artillery, the mountain gun exists only for the support of infantry and cavalry. On account of its mobility, quietness, and relative invisibility as compared with wheeled carriages requiring six harnessed animals, mountain artillery is peculiarly fitted to advance with and cooperate in the close support of infantry lines. A single mountain gun, including its carriage and other equipment, is usually carried as five mule loads. (See illustration.) A mule with his load is not as high as a mounted man, and when led in single file, with extended distances, along ditches, beds of streams, behind hedges, etc., he is far more easily concealed than the light artillery carriage with its three hitched teams and mounted drivers. A packed mule can go anywhere a man can climb without using his hands. After the mule has reached his limit of mobility, his load may be removed, carried forward by four men, and the gun assembled on its small wheels and axle and dragged by hand to positions impossible to reach with other types of field guns. Although usually about the same calibre and using about the same weight projectile, the mountain gun, owing to weight limitations, is less powerful than the 3-inch light artillery gun.

A mule load should not much exceed 250 pounds, its length should not be over 4 feet, 6 inches. A gun weighing only 250 pounds is insufficient in power for modern requirements. For this reason the modern gun itself is usually divided into two loads, transported on two mules, and assembled upon unpacking. In several modern guns this division is made just behind the base of the cartridge, the breech ring and breech block being carried on the second mule. The number of mules required to transport a single complete gun, including its carriage and equipment, varies in different armies. The usual number, as in the United States, is five mules, in some other armies, three or four. In addition there are mules to carry the ammunition, baggage, grain, rations, etc. The men, with the exception of the officers and certain noncommissioned officers who are mounted, walk and lead the packed mules. The organization is like that for light artillery (q.v.), usually four guns to the battery, three batteries to the battalion, two battalions to the regiment. In the American service there are only six regiments of field artillery. Two of these, or one-third the total, are equipped with mountain guns. This proportion is much larger than that obtaining in other armies, but is no doubt maintained on account of the necessity for mountain guns in the American colonial possessions and for possible use in Mexico. The 3-inch United States mountain gun which was issued to the service in 1915 weighs about one-third as much as the corresponding 3-inch light field gun. Its initial velocity is 900 foot seconds as compared with 1700; weight of projectile 16 pounds as compared with 15, maximum range 5500 yards as compared with 6500. The angles of elevation and fall are much greater, the mountain gun

being in fact a howitzer (q.v.). The gun and carriage are carried as five mule loads as follows: gun, cradle, top carriage and axle, trail, shields and wheels.

On the mountainous frontiers of northern Italy the Alpini, or frontier troops, organized to defend the passes, are supported by 36 mountain batteries. For similar reasons the Swiss army has a large number of mountain guns. Austria, surrounded by mountains, has given special attention to such guns. Her army has also a 30-pounder mountain howitzer, drawn on a narrow-gauge wheeled carriage and limber by three mules hitched tandem. When wheels cannot be used, the howitzer is dismounted and dragged on the trail, which is designed so as to be used as a sledge.

In the European War of 1914 mountain artillery played an important part in the Carpathian Mountains and along the German and French Swiss frontiers. The Japanese frequently found them necessary in Manchuria during the Russo-Japanese War of 1904-05. Consult: United States War Office, *Drill Regulations, Mountain Artillery* (Washington, 1908). H. A. Bethell, *Modern Guns and Gunnery* (Woolwich, 1910), id., *Modern Artillery in the Field* (New York, 1911); Bond and McDonough, *Technique of Modern Tactics* (Merrasha, Wis., 1913), H. G. Bishop, *Elements of Modern Field Artillery* (ib., 1914). See HOWITZER.

MOUNTAIN ASH. A coal-mining town and urban district in Glamorganshire, Wales, 5 miles south of Merthyr-Tydfil. It contains many fine buildings, including the town hall, the hospital, and the library institute and public hall. It has large collieries and foundries, owns its water and gas works, and maintains slaughterhouses. Pop., 1901, 31,093; 1911, 42,246.

MOUNTAIN ASH, ROWAN TREE, or QUICKEN TREE (*Pyrus aucuparia*, *Sorbus aucuparia* of many botanists). An ornamental European

MOUNTAIN ASH.

tree of the family Rosaceæ. It does not attain a great size, has in general a straight erect stem; and is distinguished from species of the other sections of *Pyrus* by pinnate glabrous leaves of serrated leaflets, terminated by a

single leaflet; corymbs of small flowers; and small globose fruit. The wood is valued for its compactness. The inner bark and sapwood have a peculiar odor. In the superstitions of European peasants a twig of rowan tree was supposed to have great efficacy in scaring away evil spirits. The generally red, sometimes yellow, fruit (rowan berries), which is acid and somewhat bitter, is sometimes used for preserves. The very nearly allied American species (*Pyrus americana*), which has bright-red fruit, is a shrub or small tree distributed from Newfoundland to Manitoba and southward in the mountains, and often planted as an ornamental. The wood is soft, light, and little used. Somewhat similar to it is the elder-leaved mountain ash (*Pyrus sitchensis*), a hardy species ranging north to Labrador and Alaska, but seldom found south of the Great Lakes region. It differs from *Pyrus americana* in its leaves, larger flowers, and fruits.

MOUNTAIN BEAVER. The sewellel (q.v.).

MOUNTAIN CAT. 1. In California, the cacomistle. 2. Any of several wild cats regarded as peculiar to local mountain regions; a catamount.

MOUNTAIN CHAIN. See MOUNTAIN.

MOUNTAIN CLIMBING. The awakening of man's interest in mountains is chiefly due to Rousseau, though earlier writers, while approaching them as scientists, were also susceptible

to alpinism is generally dated. In London in 1857 was formed the first alpine club to foster "the community of feeling amongst those who in the life of the High Alps have shared the same enjoyments, the same labors, and the same dangers." This idea, in a modified form, was taken up throughout continental Europe and advocated with such enthusiasm that doubtless 150,000 persons of both sexes are now enrolled in the various alpine societies. The largest of these are the German and Austrian (founded in 1862), about 98,000 members; Swiss (1863), 12,000; Italian (1863), 9036; and French (1874), 7000. In 1907, during the jubilee of the original alpine club, the Ladies Alpine Club was formed in London. In America several strong societies have come into being: the Appalachian Mountain Club (q.v.) in Boston (1876), 1800 members; the Sierra Club (1892) in San Francisco, 1900, the Mazamas (1894) in Portland, Ore.; the Mountaineers in Seattle (1907), 500; and the Alpine Club of Canada (1906), 800. In these derivative societies eligibility is based upon a love of nature and of the mountain in particular rather than on alpinism proper, though most of them contain a contingent of expert climbers. The American Alpine Club (1902), 82 members, with its home in Philadelphia, reverts to the original type, but adds to its field polar exploration and the study of glaciers.

* The first snow peak.

† The highest summit.

‡ The highest in range

§ The world's "record" climb.

In most instances the guides are not mentioned in this list.

ible to their charm. This twofold interest led Saussure to incite J. Balmat to find a way to the summit of Mont Blanc in 1786 and to accompany him thither in 1787. From that ascent

Thus cultivated, Alpine climbing has attained almost to a science. Its principles are set forth in extended manuals, such as Dent's *Mountaineering*, Badminton Library (London, 1892). It

has called into existence the class of professional guides—Swiss, Tyrolese, and Italian—whose skill far exceeds that of the best amateurs. Their aid, always expedient in tours above snow lines, has until recently been regarded as indispensable in attacks upon giant peaks in distant lands, but the most recent conquests by American climbers in Alaska (Mounts McKinley and Blackburn) have been made without guides.

In England, especially, mountain climbing has from the beginning held a high rank among recognized sports and the Alpine Club has always numbered among its members many of the leading scientific, literary, and professional men of the nation, such as Tyndall, Lister, Stephen, and Bryce. Properly conducted it is not a dangerous sport, much as the unhappily large toll of lives annually sacrificed through rashness or inexperience would seem to argue to the contrary. These casualties usually occur in the Alps, to which the annual resort is very great, and have never attended the carefully planned ascents of the great peaks in more distant fields. Even in Switzerland it is true that disaster seldom if ever attends the ascent of the most difficult peaks such as the Grippon, the Chamois, and the most difficult routes of the Matterhorn. Attempted only by experts, with the most experienced guides and only under the most favorable conditions, and conducted with unremitting care, the elements of risk are reduced to a minimum. The principal causes of accidents are avalanches, falling stones, breaking through cornices that overhang precipices below the summit arêtes or through snow bridges into concealed crevasses, or falls in attempting difficult crags or chimneys, often from the giving way of hand or foot holds—nearly all of which are avoidable.

Alpine ascents involve two quite different elements—snow and ice work and rock climbing. In both, the alpine rope and ice axe are indispensable aids, the former for binding together the members of the party (three is the ideal number), of whom in critical places but one moves at a time, the others being as firmly anchored as possible, the ice axe is used not merely for step cutting but also for varied service in rock climbing, as well as to replace the alpenstock. The firmness of foothold is increased by the use of various types of nails that stud the soles of the heavy waterproof boots and protect their edges from abrasion.

MOUNTAIN CORK, or **MOUNTAIN LEATHER**. A fibrous and asbestos-like variety of amphibole (q.v.). See ASBESTOS.

MOUNTAIN CRANBERRY. See CRANBERRY.

MOUNTAIN DEVIL. See MOLOCH.

MOUNTAIN FINCH. See BRAMBLING.

MOUNTAIN GAZELLE. See GAZELLE.

MOUNTAIN GOAT. See ROCKY MOUNTAIN WHITE GOAT.

MOUNTAIN GREEN. See GLAUCONITE;

GREEN EARTH.

MOUNTAIN GUN. See HOWITZER, MOUNTAIN ARTILLERY.

MOUNTAIN HERRING. The Rocky Mountain whitefish (*Coregonus williamsoni*), found in clear streams from the northern Rocky Mountain ranges to the Pacific coast. It is good food and is esteemed by anglers, as it readily takes a fly. See WHITEFISH, and Plate of WHITEFISH, SMELTS, ETC.

MOUNTAIN LAUREL. See KALMIA.

MOUNTAIN LEATHER. See ASBESTOS.

MOUNTAIN LIMESTONE. The basal strata of the Carboniferous series in the south of England and Wales. It is highly fossiliferous and carries a few ores. Its chief use is for building stone. The term was applied to the calcareous rocks of the American Subcarboniferous, but soon fell into disuse. See CARBONIFEROUS LIMESTONE.

MOUNTAIN LION. The name in the western part of the United States for the panther, cougar, or puma (*Pelis concolor*, or *cougar*). Early writers upon America reported that the lion was a resident of North America from the skins they saw among the Indians, which they supposed to be those of lionesses. See PUMA, HUNTING BIG GAME.

MOUNTAIN MEADOWS MASSACRE.

In American history, the massacre, by Indians, near Mountain Meadows in Utah on Sept. 11, 1857, of a party of emigrants from Arkansas and Missouri passing through Utah on their way to southern California. They numbered, all told, about 140 men, women, and children. On their way they were everywhere refused food until they reached the neighborhood of Mountain Meadows, a valley in Iron County, about 350 miles south of Salt Lake City. Here they stopped to rest their horses and on Sept. 7, 1857, were fired upon by Indians and, it is alleged, by Mormons disguised. They withstood siege until September 11, when, on promise of protection by John D. Lee (q.v.), Mormon Bishop and Indian agent, they left the shelter

of their wagons. All adults and children over seven years of age were killed, and 17 younger children were distributed among Mormon families, but were afterward restored to relatives by the United States government. The Mormons were accused of having instigated the massacre. Lee was executed for this crime in 1877, but a number of other indicted persons escaped conviction. In a confession made shortly before his execution Lee asserted that the massacre was committed by order of Brigham Young (q.v.) and others high in the Mormon church. H. H. Bancroft, in his *History of Utah*, discredits the confession, however, and lays the blame upon Lee and other minor fanatics. In his opinion Young was too astute to risk incurring the wrath of the American people by such an act. Consult *Confessions of John D. Lee* (St. Louis, 1891), and Linn, *Story of the Mormons* (New York, 1902).

MOUNTAIN MOCKING BIRD. See MOCKING BIRD.

MOUNTAIN PLANTS. The chief features of mountain plants have been discussed under the head of ALPINE PLANT. At the bases of most mountains the vegetation closely resembles that of the surrounding lowlands, but with elevation changes appear which correspond to the changes observed as the globe is traversed towards high latitudes. For example, in the mountains of Mexico the typical vegetation of the lowlands gives place with ascent to various zones of trees, including forms which are deciduous like those of the United States, then conifers like those of the northern United States and Canada, and finally into mosses and lichens characteristic of the alpine regions. Mountains contain a large proportion of endemic plants. This is doubtless due to their relative isolation. Mountain endemism is particularly characteristic of the alpine forms, probably because the conditions for their migration are less favorable than for those farther down. Some plants characteristic of mountain habitats are shown in the accompanying plate. See ENDEMISM.

MOUNTAIN PLOVER. A ring plover (*Agelaius montana*, or *Podasycus montanus*), very common throughout the Rocky Mountain region and neighboring plains, where its sandy gray plumage renders it almost invisible when it alights. It remains in the open lands and rarely ascends above the level (8000 to 9000 feet) of the interior parks. It breeds throughout its summer habitat.

MOUNTAIN QUAIL. A local name of two Californian partridges: (1) the plumed partridge (*Oreortyx picta*) and (2) Gambel's partridge (*Lophortyx gambeli*). See PTARMIGAN; QUAIL, and Plate of PARTRIDGES.

MOUNTAIN SHEEP. The Rocky Mountain sheep. See BIGHORN; HUNTING BIG GAME.

MOUNTAIN SICKNESS, or AVIATORS' DISEASE. See OCCUPATIONAL DISEASES.

MOUNTAIN SPINACH. See ORACHE.

MOUNTAIN SYSTEM. See MOUNTAIN.

MOUNTAIN TEA. See GAULTHERIA.

MOUNTAIN VILLAGE. An Eskimo settlement on the Yukon River, about 100 miles from its mouth. It has a Roman Catholic mission and a government school. The natives in 1913 owned 438 reindeer. Pop., 1915, about 300.

MOUNT AIRY. A city in Surry Co., N. C., 40 miles northwest of Winston-Salem, on the Southern and the Mount Airy and Eastern railroads (Map, North Carolina, B 1). Lumbering

and the quarrying of granite constitute the chief industries. The electric light and power plant is owned by the city. Pop., 1900, 2680; 1913, 3844.

MOUNT ATHOS. See ATHOS.

MOUNT AUBURN. A well-known cemetery in Cambridge, Mass., containing the graves of many celebrated men, including Longfellow, Lowell, Charles Sumner, and Phillips Brooks.

MOUNT CARMEL. A mountain range in Palestine. See CARMEL.

MOUNT CARMEL. A city and the county seat of Wabash Co., Ill., on the Wabash River 35 miles northwest of Evansville, Ind., on the Cleveland, Cincinnati, Chicago, and St. Louis and the Southern railroads (Map, Illinois, J 9). The city contains a public library and an attractive courthouse and high-school building. It is in a rich agricultural region. Besides railroad shops of the Big Four, there are many factories of tomato catsup, ice, paper, straw board, lumber, staves, and flour. Settled 1818, Mount Carmel was chartered as a city 1865. Pop., 1900, 4311, 1910, 6934.

MOUNT CARMEL. A borough in Northumberland Co., Pa., 71 miles northeast of Harrisburg, on the Northern Central, the Philadelphia and Reading, and the Lehigh Valley railroads (Map, Pennsylvania, J 5). There is an extensive anthracite mining interests here and in the vicinity, and an important coal trade carried on. The borough has also manufacturing of miners' caps, cement blocks, cigars, shirt stockings, etc., and large silk and planing mill foundry and machine shops, a knitting mill, lumber yards, a packing plant, and wagon work. Pop., 1900, 13,179, 1910, 17,532; 1914 (U. S. est.), 19,386.

MOUNT CARROLL. A city and the county seat of Carroll Co., Ill., 128 miles west of Chicago, on the Chicago, Milwaukee, and St. Paul Railroad (Map, Illinois, E 1). It has a public high-school library, the Frances Shinn school for girls, a Carnegie library, and the Caroline Mark Home for Old Ladies. Though agriculture, dairying, and stock raising are the main interests, there are valuable lead and iron-ore deposits in the vicinity. The water works are owned by the city. Pop., 1900, 196; 1910, 1759.

MOUNT CLEMENS. A city and the county seat of Macomb Co., Mich., 20 miles by rail northeast of Detroit, on the Clinton River, the head of navigation, and on the Grand Trunk Railroad (Map, Michigan, G 6). It is a popular summer and health resort, beautifully situated, and noted for its mineral springs, which possess curative properties for many diseases. The city has a Carnegie library and well-equipped hotels and bathhouses. Its industrial interests are represented by a large beet-sugar factory, cooperage works, and establishments producing carriages, wagons, sleighs, automobiles, springs, bathtubs, typewriter cabinets, pottery, and agricultural implements. Settled in 1800, Mount Clemens was laid out in 1818 by Judge Christian Clemens and was incorporated first in 1878. The government is administered, under the conventional charter of Michigan cities, by the fourth class, by a mayor, annually elected, and a unicameral council. The city owns and operates the water works. Pop., 1900, 657; 1910, 7707.

MOUNT DESERT, dē-zērt' or dēz'ért. The largest of the many islands along the coast

Maine. It is separated from the mainland on its northern end by Mount Desert Narrows (Map: Maine, D 4). A ridge of hills extends across the southern portion of the island, several of the peaks rising somewhat above 1000 feet. Numerous small bays and coves indent the coast, and there are many picturesque lakes and ponds. These lakes, with the rugged mountains and the bold cliffs along the coast, where there is much fine surf, furnish the inspiring and characteristic scenery which has made Mount Desert one of the most famous and attractive summer resorts on the Atlantic coast.

The principal harbors are Bar Harbor (so called on account of the bar which shows at low water between it and Bar Island, about ½ mile offshore), on the northwestern coast, Northeast Harbor and Southwest Harbor, at the entrance of Somes Sound, and Seal Cove, at the outlet of Seal Cove Pond—each with a village of the same name. Near the coast lie numerous islands, of which the largest are Bartlett, Swan, the Cranberry Isles, and Ironbound and several smaller islands off Bar Harbor. All of these islands are used as summer resorts. Mount Desert is connected with the mainland by a bridge across the Narrows (above referred to).

The principal village is Bar Harbor, an unincorporated settlement in Eden Township, with a population of about 2000, which is greatly augmented during the summer. It is on a branch of the Maine Central Railroad and is also served by steamship lines from New York, Boston, Portland, and other Atlantic coast ports. The ocean here is often too cold for bathing, even in summer, and a large open-air sea-water swimming pool serves as a substitute. The situation of the village is most picturesque, and there are a number of elaborately appointed hotels and many fine residences in the vicinity. There is a naval coaling station on the north shore of Eastern Bay, and Bar Harbor is frequently the rendezvous in summer of the North Atlantic squadron of the United States navy.

First discovered by Champlain, who gave the island its name, Mount Desert was settled in 1608 by French Jesuits, their colony of St Sauveur on Somes Sound, however, being destroyed eight years later by an expedition from Virginia. A permanent settlement here was effected by the English in 1761. The town of Mount Desert was incorporated in 1789. Since that date the towns of Eden, Cranberry Isles, Tremont, and Southwest Harbor have been formed from the original district and incorporated, respectively, in 1796, 1830, 1848, and 1905. Pop: Cranberry Isles, in 1910, 399; Eden, in 1910, 4441; Mount Desert, in 1900, 1569; Tremont, in 1910, 1116. Consult Street, *Mount Desert: A History* (Boston, 1905).

MOUNTED POLICE. See MILITARY POLICE for description of various military and semi-military organizations of this nature; also POLICE.

MOUNTED RANGERS. See RANGERS, MOUNTED.

MOUNTED SERVICE SCHOOL. One of the 15 or more service schools maintained in the military educational system of the United States. It is located at Fort Riley, Kans., and

includes the following subschools: the School of Equitation, the School of Farriers and Horseshoers, and the School of Bakers and Cooks.

The School of Equitation embraces four courses, viz., (a) the course for field officers; (b) the first-year course for company officers; (c) the second-year course for company officers; (d) the course in swordsmanship for noncommissioned officers. The object of the school is to give practical instruction in the following subjects:

In the course for field officers—In the methods of training the military horse as taught to company officers; in the use of the cavesson and longe, in advanced equitation of the officer; in correction of vices of the horse, in jumping, in cross-country work; in conditioning, modern breeds, crossbreeding, blood lines, conformation, and points of the horse. Duration of course, two months.

In the course for company officers—As indicated above for field officers and, in addition, hippology, horseshoeing, harness and transportation, forage, pioneer duties. The duration of the course is one year, except for 10 selected graduates of the first-year course, who are given an additional year's instruction in the most advanced work under the Saumur or French methods. Fifteen field officers and 36 company officers of cavalry and field artillery constitute the student classes. Officers of other branches of the service may be admitted upon the approval of the Secretary of War.

In the course in swordsmanship, cavalry noncommissioned officers alone are eligible—one from each regiment. The course is six months.

The School of Farriers and Horseshoers embraces two courses:

The course of instruction for enlisted men, farriers, is four months and includes the army horse in accident and disease, hospital work, first aid, bandages, treatment of wounds, sprains, bruises, abrasions, abscesses, operations, dissections, determination of age, conformation, defects, blemishes, lameness, and dispensary work. The course for enlisted men, horseshoers, includes actual work in the shoeing shop in all the departments of shoeing and of care of feet.

The School of Bakers and Cooks for enlisted men. Duration of course from three to five months. Includes practical instruction in all departments of cooking the government ration, baking bread, keeping accounts, and handling field bakeries in campaign. About 1600 pounds of bread are baked daily for the use of the garrison stationed at this post.

The personnel of the Mounted Service School consists of a commandant, who is a field officer, usually a colonel or lieutenant colonel of cavalry; the school staff, the Mounted Service School detachment; and the officers and enlisted men detailed as students. In addition to the personnel of the Mounted Service School there are stationed at Fort Riley, as a permanent garrison, a regiment of cavalry and a regiment of field artillery. The Field Artillery Board, formerly stationed at this post, has been transferred to Fort Sill, Okla., where the School of Fire for Field Artillery and the School of Musketry are now located. See FIELD ARTILLERY: SCHOOL OF FIRE FOR FIELD ARTILLERY; SCHOOL OF MUSKETRY; MILITARY EDUCATION.

MOUNT EVEREST. See EVEREST, MOUNT.

MOUNTFORT, WILLIAM (?1664-92). An

English actor and playwright. As early as 1678 he was playing in London. After 1682 he was a member of the company at the Theatre Royal and was the creator of many parts in the drama of the time, besides writing and adapting several plays, such as *The Injur'd Lovers*, or *the Ambitious Father* (published 1688), *Successful Strangers* (1690); *King Edward the Third* (1691); *Greenwich Park* (1691). According to the common account of his death, he was assassinated Dec 9, 1692, by Capt. Richard Hill, a jealous admirer of Mrs. Bracegirdle. Consult Cook, *Hours with the Players* (London, 1881), and Cibber, *Apology*, edited by Lowe (ib., 1889).

MOUNT HELICON. See HELICON.

MOUNT HOLLY. A town and the county seat of Burlington Co., N. J., 20 miles east of Philadelphia, on Rancocas Creek and on the Pennsylvania Railroad (Map: New Jersey, C 3). It has the Burlington County Hospital, Children's Home, the Burlington County Lyceum of History and Natural Science, founded in 1876, which possesses a library of 6500 volumes, and several old Colonial buildings, including a Friends' meetinghouse, and a courthouse and jail. The industries are represented by several extensive shoe factories and by machine shops, foundries, canneries, a hosiery mill, leather-goods works, a curtain factory, etc. Pop., 1900, 5168; 1910, 5652.

MOUNT HOLYOKE (hōl'yōk) COLLEGE. An institution for the education of women at South Hadley, Mass. In 1837 Mount Holyoke Seminary was established by Mary Lyon (q.v.), from this grew Mount Holyoke College, which received its charter in 1888. In addition to the regular undergraduate courses, provision is made for graduate work, and special courses are open to teachers. The four years' course includes two years of prescribed and two years of elective work, leading to the degree of A.B. The college offers a large number of scholarships and four graduate fellowships. There were enrolled in all departments, in the collegiate year 1914-15, 796 students, with a faculty and staff of 114. Upon the college campus of more than 150 acres, attractively laid out, are built, 16 dormitories, Mary Lyon Hall, which occupies the site of the original building (destroyed by fire in 1896) and includes the chapel and offices of administration, a well-equipped gymnasium, an observatory, Lydia Shattuck Hall for chemistry and physics; Lyman Williston Hall for natural sciences; Dwight Memorial Art Building, a library of 56,000 volumes, with permanent fund of \$25,000; a music building, the Skinner Recitation Hall; and the student alumnae building—the latter two in process of construction in 1915. The student alumnae building will contain a large auditorium and offices for the various student and alumnae organizations. The productive funds of the college amounted in 1914 to \$1,480,000, and its gross income was \$344,000. Buildings and grounds are valued at \$1,128,000 and the entire college property at \$2,256,000. The president in 1915 was Miss Mary F. Woolley, A.M., LL.D., Litt.D., L.H.D.

MOUNT HOOD. See HOOD, MOUNT.

MOUNT HOOKER. See HOOKER, MOUNT.

MOUNT KENIA. See KENIA, MOUNT.

MOUNT KISCO. A village in Westchester Co., N. Y., 37 miles north of New York City, on the New York Central Railroad. It is in a fertile agricultural region and contains a fine

public library, several fraternal organizations, and several beautiful estates and residences. The water works are owned and operated by the village. Pop., 1900, 1346; 1910, 2802.

MOUNT LEBANON. See LEBANON, MOUNT.

MOUNT LOGAN. See LOGAN, MOUNT.

MOUNT MANSFIELD. See MANSFIELD, MOUNT.

MOUNT MARCY. See MARCY, MOUNT.

MOUNT MOR'GAN. A municipality of Raglan Co., Queensland, Australia, 24 miles south-southwest of Rockhampton and 404 miles from Brisbane by rail (Map: Queensland, G 7). It is noted for the abundance and richness of the gold deposits found on the mountain summit and inclosed in a rock mass largely composed of iron ore and siliceous sinter. The yield of the Mount Morgan Mine (gold and copper) was, in 1911, \$2,733,850. Pop., 1904, 6280, 1911, 7650.

MOUNT MORRIS. A village in Livingston Co., N. Y., 34 miles south by west of Rochester, on the Delaware, Lackawanna, and Western, the Erie, the Dansville, and Mount Morris, and the Pennsylvania railroads (Map: New York, C 5). Noteworthy features are the public library and post-office buildings and the picturesque Genesee River High Banks. There are also canning factories and municipally owned water works. Pop., 1900, 2410, 1910, 2782.

MOUNT MOTTARONE. See MOTTARONE, MOUNT.

MOUNT OF OLIVES. See OLIVES, MOUNT OF.

MOUNT OF OLIVES (Christus am Oelberg). An oratorio by Beethoven (q.v.), first produced in Vienna, April 5, 1803, in the United States, March 24, 1833 (Boston).

MOUNT OLIVE. A village in Macoupin Co., Ill., 43 miles northeast of St. Louis, Mo., on the Wabash, the Illinois Central, the Illinois Traction, and the Litchfield and Madison railroads (Map: Illinois, E 7). There are extensive coal mines, and flour milling and coal mining constitute the chief industries. The water works and electric-light plant are owned by the village. Pop., 1900, 2935, 1910, 3501.

MOUNT OLIVER. A borough in Allegheny Co., Pa., 2 miles from Pittsburgh, of which it is a residential suburb. Pop., 1910, 4241.

MOUNT OLYMPUS. See OLYMPUS.

MOUNT PARNASSUS. See PARNASSUS.

MOUNT PILATUS. See PILATUS.

MOUNT PLEASANT. A town and the county seat of Henry Co., Iowa, 28 miles west by north of Burlington, on the Chicago, Burlington, and Quincy Railroad (Map: Iowa, F 4). It is the seat of a State Hospital for the Insane, the Iowa Wesleyan College (Methodist Episcopal), opened in 1844, and was until 1911 the seat of the German College, opened in 1873. It has also several secondary institutions, a conservatory of music, and a public library. Mount Pleasant is the centre of a productive farming country and is an important shipping point for live stock, especially horses. There are grain elevators, repair shops, a planing mill, a brick and tile factory, a canning factory, etc. Limestone is extensively quarried in the vicinity. The water works and electric-light plant are owned by the municipality. Pop., 1900, 4109; 1910, 3874; 1915, 4078.

MOUNT PLEASANT. A city and the county seat of Isabella Co., Mich., 54 miles west by north of Saginaw, on the Chippewa River

and on the Ann Arbor and the Pere Marquette railroads (Map: Michigan, E 5). It is the seat of the Central State Normal School and of a United States Government Indian School and has a handsome courthouse. A fertile agricultural region surrounds the city, and there are manufactures of lumber and various lumber products, flour, woolen goods, plows, foundry products, brick and tile, wagons, condensed milk, etc. The water works are owned and operated by the municipality. Pop., 1900, 3662; 1910, 3972.

MOUNT PLEASANT. A town in Westchester Co., N. Y., 25 miles north of New York City, on the Hudson River and on the New York, New Haven, and Hartford Railroad (Map: New York, B 1). It is composed of the villages of North Tarrytown, Pleasantville, Sherman Park, and part of Briar Cliff Manor. Among the noteworthy features are the Westchester County Hospital, St. Joseph's Normal School, the Hebrew Sheltering Aims, the Dominican Fathers Home for Cripples, and the Cancer Hospital. Of interest in the vicinity are the Sleepy Hollow Cemetery, the old Dutch church, and the André Monument. The manufacture of automobiles constitutes the town's chief industry. Pop., 1900, 8698, 1910, 11,863.

MOUNT PLEASANT. A borough in Westmoreland Co., Pa., 69 miles by rail southeast of Pittsburgh, on the Baltimore and Ohio and the Pennsylvania railroads (Map: Pennsylvania, C 7). It is the seat of the Western Pennsylvania Classical and Scientific Institute (Baptist) and has a fine municipal building. The borough is the centre of an extensive coke-making industry and manufactures also flour, lumber, iron, foundry products, glass, etc. Pop., 1900, 4745, 1910, 5812.

MOUNT PLEASANT. A city and the county seat of Titus Co., Tex., 60 miles west by south of Texarkana, on the St. Louis Southwestern and the Paris and Mount Pleasant railroads (Map: Texas, E 3). It is in a productive cotton, corn, and trucking region and has a hardwood heading mill. Delwood Park and the Red Mineral Springs are worthy of note. There are municipal water works. Pop., 1910, 3137.

MOUNT RORAIMA. See RORAIMA, MOUNT.

MOUNT RUWENZORI. See RUWENZORI.

MOUNT SAINT MARY'S COLLEGE. A Roman Catholic college founded at Emmitsburg, Md., in 1808. It is controlled by a board of directors, of whom the Archbishop of Baltimore is president. The college has, in addition to the regular courses, a preparatory, a scientific, and a business course. The total enrollment in all departments in 1913-14 was 355 students and 27 instructors. A degree of A B only is conferred. The library contains about 20,000 volumes. The president in 1915 was Rt. Rev. Mgr. Bernard J. Bradley, A.M., LL.D.

MOUNT SHASTA. See SHASTA, MOUNT.

MOUNT SINAI. See SINAI.

MOUNT SINAI MANNA. See MANNA.

MOUNT STEPHEN, GEORGE STEPHEN, first BARON (1829-). Canadian capitalist and railway promoter, born at Dufftown, Banffshire, Scotland. Going to Canada in 1850, he entered the dry-goods business in Montreal. He succeeded there as a cloth manufacturer and became wealthy. In 1876-81 he was president of the Bank of Montreal. Having been successful in railway operations in Minnesota and Manitoba, he later was conspicuous chiefly for his

share in carrying through to completion the long-delayed Canadian Pacific Railway, of which he was president in 1881-87. For his services in this connection he was made Baronet by Queen Victoria (1886), and the following year he and Sir Donald Smith (afterward Lord Strathcona) gave \$500,000 each for the building of the Royal Victoria Hospital, Montreal, in commemoration of her Majesty's jubilee. In 1888 he went to reside in England and in 1891 was created first Baron Mount Stephen, a title taken from a peak in the Rocky Mountains named for him during the construction of the Canadian Pacific Railroad.

MOUNT STERLING. A city and the county seat of Montgomery Co., Ky., 33 miles east of Lexington, on the Chesapeake and Ohio Railroad (Map: Kentucky, G 3). It has a public library and several private educational institutions. The city controls important tobacco and cattle interests, and among its industries are planing mills, flouring mills, machine shops, lunch-box and glove factories, and a distillery. Pop., 1900, 3561, 1910, 3932.

MOUNT TACOMA. See TACOMA, MOUNT.
MOUNT-TEMPLE, WILLIAM FRANCIS COWPER-TEMPLE, BARON (1811-88). An English politician, born in Hertfordshire. He studied at Eton and became an officer of the Royal Horse Guards. In 1835 he became secretary to his uncle, Lord Melbourne, who was then Prime Minister. He served in Parliament for Hertford from 1835 to 1863 and for South Hampshire from 1868 to 1880 and was Commissioner of Works in 1860-66. He inherited estates in Ireland from his stepfather, Lord Palmerston, in 1869 and then changed his surname to Cowper-Temple. In 1870 he introduced into the Education Bill the Cowper-Temple clause, which forbade religious instruction in rate-aided schools. He became Baron Mount-Temple in 1880.

MOUNT TOM. See TOM, MOUNT.

MOUNT UNION. A borough in Huntingdon Co., Pa., 45 miles southeast of Altoona, on the Juanita River and on the Pennsylvania and the East Broad Top railroads (Map: Pennsylvania, F 7). Its noteworthy features include Crum, Perduzzi, and Stratford blocks and the Mount Union Library. There are silica brick-works, a tanning and extract plant, coal yards, foundry and machine shops, and extensive manufacturing of refractories. In the vicinity are found bituminous coal, a high grade of gneiss rock, fire clay, and some timber. The water works are owned by the municipality. Pop., 1900, 1086; 1910, 3338.

MOUNT UNION COLLEGE. A coeducational institution for higher education founded at Alliance, Ohio, in 1816 as Mount Union Seminary and chartered as Mount Union College in 1858. It was the first institution in the United States to admit women to graduation on exact equality with men. In 1911 Scio College of Scio, Ohio, was consolidated with Mount Union College. The college included until 1915 an academy which in that year was discontinued. In addition to the college of liberal arts there is a conservatory of music, and a summer school is maintained. The total attendance in 1914-15 was 742, with 252 in the college, 352 in the conservatory, and the rest in the summer school. The college faculty numbered 19 and the instructors in the conservatory 15. The college campus includes 50 acres, with six buildings, a lake, two parks, and an athletic field. It has a pro-

ductive endowment of \$286,000 and an annual income of about \$35,000. The value of the buildings and grounds is about \$223,000. The library contains about 16,000 volumes. The president in 1915 was Rev. M. C. McMaster, A.M.

MOUNT VERNON. The home and burial place of George Washington, in Fairfax Co., Va., on the right bank of the Potomac, 15 miles south of Washington, D. C. (Map: Virginia, G 3). The Washington mansion, beautifully situated on an eminence, commanding a view of the river, is of wood, two stories high, 96 feet long, and 30 feet deep. It was built in 1743 by Washington's elder brother, Lawrence, who called it Mount Vernon, after Admiral Vernon, under whom he had served in the British navy. A high piazza runs along the front of the house, which has six rooms of moderate size on the ground floor, containing many objects of historical interest. The plain brick tomb to which Washington's remains were removed from the old family vault in 1831 stands a few hundred yards from the house, near a wooded ravine. Mount Vernon, which had been much enlarged by Washington, was by him bequeathed to Bushrod Washington, upon whose death it came into the hands of John A. Washington, his nephew, who sold it in 1858 to the Ladies' Mount Vernon Association, which holds it in trust as a place of national interest. Consult: B. J. Lossing, *The Home of Washington and its Associations, Historical, Biographical, and Pictorial* (new ed., New York, 1865); Wineberger, *Home of Washington at Mount Vernon and its Associations* (Washington, 1866). T. N. Page, *Mount Vernon and its Preservation* (New York, 1910).

MOUNT VERNON. A city and the county seat of Jefferson Co., Ill., 76 miles by rail east by south of St. Louis, Mo., on the Louisville and Nashville, the Chicago and Eastern Illinois, the Southern, and the Wabash, Chester, and Western railroads (Map: Illinois, G 9). It has an attractive Supreme Court building, Carnegie library, and Highland Park and is engaged principally in agriculture, coal mining, and the manufacture of cars, machine-shop products, axe handles, lumber, flour, hosiery, catsup, cut glass, mattresses, etc. There are also a large grain elevator, knitting and canning factories, and a tie-preserving establishment. Pop., 1900, 5216, 1910, 8007.

MOUNT VERNON. A city and the county seat of Posey Co., Ind., 20 miles west by south of Evansville, on the Ohio River and on the Louisville and Nashville and the Chicago and Eastern Illinois railroads (Map: Indiana, B 9). It has a fine courthouse, a Carnegie library, and a handsome Soldiers and Sailors Monument. There are manufactories of flour, hominy, lumber, foundry and machine-shop products, engines, carriages, etc. Mount Vernon is a commercial centre of considerable importance for a fertile region in which corn and wheat are abundant. Pop., 1900, 5132; 1910, 5563.

MOUNT VERNON. A city in Westchester Co., N. Y., on Eastchester Creek, an arm of Long Island Sound, and the Bronx River and on the New York Central and Hudson River, the New York, Westchester, and Boston, and the New York, New Haven, and Hartford railroads (Map: New York, B 2). It is chiefly a residential suburb of New York City, which it adjoins on the north. It has more than 50 miles of well-paved and shaded streets and in the more

elevated parts of the city, which command fine views of the Sound, there are costly mansions. Mount Vernon maintains a Carnegie library. Among the prominent edifices are the Lucas building, which contains the city offices, the Mount Vernon Hospital, Proctor Theatre building, the post office, and many churches and school buildings. There are manufactories of silver deposit, machinery, and clothing. Mount Vernon was founded in 1852, was incorporated as a village in the following year, and in 1892 was chartered as a city. The government, under the original charter, is vested in a mayor, elected every two years, and a municipal council. Pop., 1900, 21,228; 1910, 30,919; 1914 (U. S. est.), 35,047.

MOUNT VERNON. A city and the county seat of Knox Co., Ohio, 25 miles north by west of Newark, on the Kokosing River, and on the Baltimore and Ohio and the Pennsylvania railroads (Map: Ohio, F 5). It has a fine courthouse, a public library, a large State tuberculosis sanitarium, and Hiawatha Park with a picturesque lake. There are locomotive, bridge, and Corliss-engine works, a large foundry, flour and saw mills, bent-wood works, and manufactories of furniture, glass, hoops, staves, sashes, and doors. The city is the centre of a fertile agricultural region, and near by are found natural gas and timber in abundance. The water works are owned by the municipality. Pop., 1900, 6633; 1910, 9087.

MOUNT WASHINGTON. See WASHINGTON, MOUNT.

MOUNT WHITNEY. See WHITNEY, MOUNT.

MOUNT WILSON SOLAR OBSERVATORY OF THE CARNEGIE INSTITUTION OF WASHINGTON. An astronomical observatory devoted to solar research and the study of stellar evolution. The computing offices, laboratories, and instrument shops are at Pasadena, Cal., while the telescopes and other apparatus for astronomical observations are at the summit of Mount Wilson (5886 feet), about 16 miles distant. The knowledge derived from the study of the sun, which is the only star sufficiently near the earth to be examined in detail, is applied to the interpretation of stellar phenomena, the chief object in view being to throw as much light as possible on the evolution of stars and the structure of the universe. An important phase of the work is the imitation of celestial phenomena in the Pasadena laboratories, which are equipped with a great variety of instruments for this purpose. The chief instruments on Mount Wilson include: (1) the Snow horizontal telescope, used daily for photographing the sun, both directly and with the spectroheliograph, which records the invisible clouds of calcium vapor and hydrogen gas in its atmosphere; (2) the 60-foot tower telescope, with 30-foot spectrograph and spectroheliograph, used chiefly for the study of the pressure and motions of gases at various levels in the solar atmosphere; (3) the 150-foot tower telescope, with 75-foot spectrograph and spectroheliograph, mainly employed for the investigation of the magnetic phenomena of sun spots and of the sun as a whole; (4) the 60-inch reflecting telescope, devoted to the photography, both direct and spectroscopic, of stars and nebulae; (5) the 100-inch reflecting telescope (not yet completed), which will also be used for stellar research. For a popular account of the purposes and work of the observatory, consult *Ten Years' Work of a Mountain Observatory*,

MOURNING BRIDE, THE. A play by William Congreve (1697). The play is the source of the famous lines beginning, "Music hath charms to soothe the savage breast."

MOURNING CLOAK. A handsome butterfly (*Euvassessa*, or *Vanessa, antiopa*), known in England as the Camberwell beauty. It appears

THE MOURNING CLOAK.

in the United States very early in the spring and may not infrequently be seen flying about on warm days in winter. It hibernates in the adult stage even in cold climates. According to Seudder it ranges from the Arctic circle to the thirtieth parallel of latitude. It is purplish brown, with wings bordered by yellow, brown, and blue. The larvæ are covered with black spines and feed gregariously on willow, elm, poplar, and hackberry, often stripping the larger branches of leaves. The species is two-brooded, and the second generation of moths appears in midsummer.

MOURNING DOVE. The Carolina dove. See DOVE.

MOUROMTSEV, SERGEI. See MUROMTSEV, S. A.

MOURZOUK, mūr-zōōk'. A town of Africa. See MURZUK.

MOUSCRON, mōōs'krōn'. A town of Belgium in the Province of West Flanders, situated near the French frontier, 32 miles southwest of Ghent (Map: Belgium, B 4). It is a customs station, has an episcopal college, and manufactures furniture and cotton and woolen goods. Pop., 1900, 19,366; 1910, 22,188.

MOUSE (AS., OHG. *mūs*, Ger. *Maus*, Lat. *mus*, Gk. *mūs*, *mys*, OChurch Slav. *myshi*, Skt. *mūṣa*, mouse, from *mūṣ*, to steal). The word "mouse" was originally applied to a small rodent mammal, *Mus musculus*, now called the house mouse, which was formerly confined to the Old World, but is now cosmopolitan in its distribution. Gradually the use of the word has extended to other small rodents, and especially in compounds to mammals not rodents, and even to birds. This troublesome little rodent is a small gray creature, with a body about 3 inches long and a tail half that length, the ears rather large and very delicate, and small feet. The color shows considerable variation, in some cases having a strong brown cast, while in others it becomes very pale and even fades to white. In its habits the mouse is largely nocturnal, though often seen during the day. It makes its home in sheltered nooks and crannies, where a nest of rags, paper, feathers, etc., is nicely made. Mice are very prolific, 6 to 10 young being born at a time, and there are many broods during the year. Much has been written about the singing

powers of the mouse, and the fact that it does sing is supported by the evidence of perfectly trustworthy witnesses. Mice are unquestionably fond of music, but it is not fully determined whether their ability to make it is normal or is an individual peculiarity. Some writers have gone so far as to assert that it is due only to a diseased throat.

The name "mouse" is applied to any representative of the genus *Mus* not big enough to call a rat. This genus is one of the largest of mammalian genera, although recently there is a tendency to split the group into several. It has been usually defined as including upward of 130 species, which vary considerably in size, somewhat in color, and not a little in the softness of the pelage. The upper molar teeth are always wide, with three series of tubercles, and therefore called trituberculate; in this respect *Mus* differs from all of the native American rats and mice. Another characteristic of the genus is the long, slender, rounded tail, with whorls of scales, and few hairs; in some mice this is almost prehensile. Besides the common mouse the following may be mentioned as well-known European species: the wood mouse (*Mus*, or *Apodemus, sylvaticus*), which is a trifle larger than its cosmopolitan cousin, and on account of its longer tail is sometimes called the long-tailed field mouse; it is abundant in Great Britain and is noted for the large stores of grain which it hoards. The harvest mouse (*Mus*, or *Micromys, minutus*) is the smallest of British quadrupeds, the length exclusive of tail being only about 2½ inches; it occurs chiefly in the southern parts of England and is notable for its curious globular nest, composed of grass leaves and panicles woven together and suspended between stalks of grain or tall grass; a somewhat smaller species (*Mus*, or *Micromys, pumilus*) occurs in the south of Europe. Asia and Africa have many species, as the curious black-striped Barbary mouse, which looks like a miniature American ground squirrel.

In America the name "mouse" is applied to a large number of small mammals, especially in such compounds as wood mouse, field mouse, etc. Some of these are very different from the true mice, but nearly all belong to the family Muridæ, though not to the Murinæ with the Old World mice. Many of them are voles, of the subfamily Microtinæ, while others are vesper mice or white-footed mice of the subfamily Cricetinae, to which the hamsters also belong. A typical American example of this latter group is the well-known and widely distributed white-footed mouse or deer mouse (*Peromyscus leucopus*), which is found, in some one of many local races, nearly throughout North America. It is about 7 inches long, of which nearly one-half is the tail. The upper surface is fawn color of some shade, while the under parts and the feet are snowy white. The ears are rather large, and the general form and appearance delicate and graceful. It is found in all sorts of situations and even lives in houses sometimes, like the common mouse. In the Central and Southern States another species even handsomer than this occurs, known as the golden mouse (*Peromyscus aureolus*). It is golden cinnamon above and yellowish white beneath. The largest and in some respects the most remarkable of this group is the rice-field mouse (*Oryzomys palustris*), which is 10 or 11 inches long, dark grizzily rat color, and has very harsh pelage. It is said to be more

like the true mice than any other American species. The curious little harvest mouse (*Ochetodon*, or *Reithrodontomys, humilis*) of the Southern States is one of the smallest of American quadrupeds, being only 4 inches long, and half of that is tail. More detailed information will be found under the names of these and other mice, as JUMPING MOUSE, MEADOW MOUSE, ETC. See also accompanying Plate of MICE AND JERBOAS.

Consult authorities cited under MAMMALIA.

MOUSE, FLYING. See FLYING PHALANGER.

MOUSE BIRD. Any bird of the African genus *Colius* and family Coliidae, a coly. These birds have soft gray and white plumage, conical brightly colored bills, and long and narrow central tail feathers, and take their name not only from their ashy plumage, but from their mouse-like activity in scrambling about the branches of trees, where they hang head downward (even sleeping that way), and swing and twist like acrobats. They are enabled to do this by the striking peculiarity of structure in the feet, which have all four toes turned forward. They are fruit eaters, go about in small bands, but fly poorly, and build their nests in dense shrubs. See Plate of KINGFISHERS, MOTMOTS, ETC.

MOUSE DEER. See CHEVROTAIN.

MOUSE-EAR CHICKWEED (*Cerastium*). A genus of numerous species of plants of the family Caryophyllaceae, natives of temperate and cold countries throughout the world. Some of them are among common weeds; others, having larger flowers, are occasionally planted in flower borders and on rockwork. The form and hairiness of the leaves of some species have given rise to the popular name.

MOUSE FISH. One of the tropical frogfishes (*Pterophyrne hystrio*), common in the Gulf of Mexico, the colors of which are highly variable. It is related to the anglers (see ANGLER), and its bait is its first dorsal spine, which is bifurcate. The fact that it is frequently found in the fields of sargasso weed of the Atlantic gives it a second name, sargassum fish.

MOUSE LEMUR. A very small woolly lemur of Madagascar, nocturnal and mouse-like in its appearance and habits. It is a member of the genus *Chirogaleus*. Five species are recognized. See CHIROGALE, LEMUR, Plate of LEMURS.

MOUSE TOWER. A tower built on a rock in the middle of the Rhine near Bingen. According to popular tradition, it was hastily erected by Archbishop Hatto I of Mainz (q.v.) as a refuge from the swarms of mice sent to devour him in punishment for his cruelty to the poor, whom he burned in a granary during a famine. The German name Mäuseturm is probably a popular corruption of Mautturm, toll tower, for which the structure appears to have been originally intended, and the legend was built about the name. According to some authorities, the building was a watch tower, and the name is referred to Old German *musen*, to spy. It is now used as a signaling station for steamers.

MOUSTERIAN (mōŭ-stē'ri-an) EPOCH. See PALEOLITHIC PERIOD.

MOUTH (AS. *mūþ*, Goth. *munþs*, OHG. *mund*, Ger. *Mund*, mouth; connected with Lat. *mentum*, chin, and ultimately with Skt. *mukha*, face). In an animal, the opening through which food enters the body. Not all animals have mouths, for certain parasitic forms, notably the tapeworm, lack a system for digesting food, and conse-

quently no opening for its entrance is necessary; in such cases the food is absorbed through the surface of the animal. The simplest form of mouth is that which occurs in the Protozoa, where the food is taken into the body through a special opening, which is fairly constant in position and may be surrounded with cilia, sometimes long. Many Protozoa, as well as sponges, have no mouth in any true sense, as the food may be taken in at any part of the body surface, and therefore the opening has no fixed position and no regular size or form. The mouth of corals, jellyfish, sea anemones, and other coelenterates is simply an opening, almost always central in position, on the lower surface in free-swimming forms, on the upper surface in fixed forms. It is usually circular, but may be flattened, and in one group of jellyfish it is divided up into four or more, sometimes innumerable, small openings, by the growing together of the lobes on its margin. In the flatworms the mouth is usually circular and is often in the centre of a sucker, but its position is variable, though it is always on the ventral side. It may be near the anterior end of the animal, but it is more often at the centre and is sometimes posterior. Among the various classes of worms the mouth is always anterior, and often terminal, though more often on the lower side of one of the first segments or, in unsegmented forms, in a similar position. In bloodsuckers it lies in the centre of a powerful sucker, and is provided with three chitinous jaws, in vegetable-eating and some carnivorous forms (nematines) it is a simple opening without jaws, while in such active carnivorous worms as *Nereis* it is provided with powerful jaws. These jaws, however, are clearly modified segmental appendages, and are practically feet which have become modified to assist in seizing food or forcing it into the mouth. In the crustaceans, insects, spiders, and the like (arthropods) the mouth is more or less terminal and is provided with lateral jaws; sometimes as many as eight pairs of appendages are modified to serve for this purpose. The structure and arrangement of the mouth parts in insects are very complicated and are of great importance in classification. Roughly they may be grouped as *biting*, when there are freely movable lateral jaws which seize and cut or tear the food, *piercing*, when the various parts are more or less united to form a sharp, piercing instrument, which penetrates animal or plant membranes in search of the fluid food, which is then sucked; *sucking*, when the parts are united to form a suctorial tube, with no adaptation for piercing.

Among echinoderms the mouth shows considerable variety of form. In mollusks the mouth is generally anterior and often ventral, but it is frequently terminal. In the devilfish, squids, and the like, it is in the centre of the foot. In the clams and other lamellibranchs there are special organs of sense, known as labial palps, on each side of the mouth, but there is no tongue, while in all other mollusks a tongue covered with teeth and known as the radula is present. The cephalopods (squids and the like) have powerful jaws, arranged like the beak of a parrot, but in all other mollusks the jaws are small and rather weak, sometimes three in number, or they may be wholly wanting, as in the lamellibranchs.

In the vertebrates we find the formation of the mouth is used by some writers to divide them into two contrasted groups, the *cyclostomes*

MICE AND JERBOAS

1. AMERICAN JUMPING MOUSE (*Zapus Hudsonius*).
2. EGYPTIAN JERBOA (*Dipus Aegypticus*).
3. YARKAND JERBOA (*Euchoreutes naso*).
4. KIRGHIZ JERBOA (*Alactaga decumana*).

5. BARBARY STRIPED MOUSE (*Mus Barbarus*).
6. HOUSE-MOUSE (*Mus musculus*).
7. HARVEST-MOUSE (*Mus minutus*).
8. MEADOW-MOUSE (*Microtus Pennsylvanicus*).

or round mouths and the *gnathostomes* or jaw mouths. The round mouths include only three or four genera, and are characterized by the absence of jaws, the mouth serving as a sucking organ. The surface of this mouth sucker bears characteristic horny teeth. All the other vertebrates are *gnathostomes*, provided with vertically moving upper and lower jaws, one or both of which, except in birds, turtles, and some whales, bear teeth. There are also a tongue and various glands, notably the salivary glands. True lips, provided with muscles, are characteristic of mammals, but are also found in diploid fishes. In many mammals the sides of the buccal cavity—i.e., the space outside the jaws—are enlarged to form cheek pouches, of use as food reservoirs. The origin of the vertebrate mouth has been a matter of much discussion and is closely associated with the still more fundamental question of the origin of the skull. Apparently, however, the jaws arise as modifications of the first branchial arch, which becomes divided into two parts, the proximal giving rise to the quadrate bone, which gives rise to an anterior process, forming a sort of primary upper jaw; the distal part is the cartilage of Meckel, the basis of the lower jaw.

See ALIMENTARY SYSTEM, GLAND, SKULL; TEETH, TONGUE.

MOUTH, DISEASES OF THE. From its situation at the portal of the digestive tract, the mucous membrane lining this cavity is peculiarly exposed to many forms of irritation and infection. The following are the principal forms of inflammation of the mouth, or *stomatitis* (Gk *στόμα*, *stoma*, the mouth), as it is termed by nosologists:

1. *Acute catarrhal stomatitis*, which may extend over the mouth, including the tongue, or may occur in limited areas, is seen in children, associated with dentition or gastrointestinal disturbances, and in adults following excessive smoking or the taking of hot or too highly seasoned food. It is a frequent concomitant of indigestion and febrile diseases, but is more commonly a complication of other diseases than an original affection. In ordinary cases a simple mouth wash composed of a solution of borax and honey, and gentle catharsis, will effect a rapid cure.

2. *Parasitic stomatitis*, a diffuse inflammation with the formation of patches of false membrane, is caused by a fungus—the *Saccharomyces albicans*, also known as *Oidium albicans*. It occurs most commonly in young children, and is described under its popular name, THRUSH.

3. *Aphthous stomatitis*, also known as herpetic, follicular, or vesicular stomatitis, is an inflammation of the follicles of the mucous membrane and is described in the article APHTHÆ.

4. *Ulcerative stomatitis*, sometimes called *fetid stomatitis*, or putrid sore mouth, generally occurs in children after the first dentition and is associated with defective hygienic and sanitary conditions. The ulcerative process begins usually at the margin of the gums and extends along the gum lines of the jaws. The bases of the ulcers are covered with a grayish-white adherent membrane. The swelling of the adjacent parts is often so considerable as to be apparent externally. There is a copious flow of saliva, and the breath is very offensive. The ulceration may continue for weeks, or even months, but always yields to treatment. The

febrile symptoms and the constipation which are usually present must be combated in the ordinary way. Perhaps the best general method of treating the disease is by the administration of small doses of chlorate of potash and by frequently washing the mouth with a weak solution of the same drug, or of borax, sodium salicylate, or hydrogen peroxide.

5. *Gangrenous stomatitis, cancrum oris, or noma*, is the most severe form of stomatitis and occurs as a rule in feeble children between two and five years old during convalescence from the acute fevers. It occurs frequently in institutions, is believed to be mildly contagious, and is associated with the presence of Vincent's microorganisms. The disease is characterized by a rapidly progressing gangrene, beginning on the cheeks or gums, resulting in extensive destruction of the soft tissues, at times even invading the jawbones and ears. The constitutional disturbance is great and the prostration extreme, and the case usually terminates in death. Treatment is unsatisfactory. Early destruction of the ulcer by the cautery, careful nourishment, and free stimulation may arrest the disease. Salvarsan (q.v.) has been suggested as a remedy.

6. *Mercurial stomatitis* and other diseases of the mouth are noticed in the articles GUMS, DISEASE OF; RANULA; SALIVATION, SCURVY; THRUSH; TONGUE, TUMOR (for cancer). Consult J. S. Marshall, *Mouth Hygiene and Mouth Sepsis* (Philadelphia, 1912), and Broomell and Fischelis, *Anatomy and Histology of the Mouth and Teeth* (4th ed., 1b, 1913).

MOUTON, mōw-tōn', ALEXANDER (1804-85). An American politician, born in what is now Lafayette Parish, La. He graduated at Georgetown College (District of Columbia), studied law, and was admitted to the bar in 1825. In 1826 he was elected to the Lower House of the Legislature and was Speaker in 1831-32. He was a presidential elector in 1828, 1832, and 1836, and in 1837 was elected to the United States Senate. He resigned in 1842 to accept the nomination for Governor of Louisiana, was elected, and served from 1843 till the adoption of the new constitution in 1846. He was president of the Southwestern Railway Convention in 1853 and a delegate to the National Democratic Conventions in 1856 and 1860. In 1861 he presided over the Louisiana convention called to consider the question of seceding from the Union. In the latter part of the same year he was a candidate for the Confederate Senate, but failed to be elected and then retired to his plantation, where he spent the remainder of his life.

MOUTON, mōw-tōn', GEORGES. See LOBAU, COUNT DE.

MOVABLES (OF. *movable*, *mouvable*, Fr. *mouvable*, from Lat. *movere*, to move). Such subjects of property as can be moved or transported from one place to another. The term is used as contradistinguished from things immovable, as lands and chattels which have become definitely and permanently attached to land as fixtures. The terms "movable" and "immovables" are sometimes inaccurately employed as identical in meaning with personal and real property, respectively. While most movable chattels are personal property, some, as heirlooms, are classed as real property, and many important estates or interests in land, as mortgages and leaseholds, are classed as personal property. Moreover, there are many

kinds of property, of an intangible or incorporeal character, to which the terms "movable" and "immovable" are wholly inapplicable, such as debts and other choses in action, patent rights, copyrights, shares of stock in corporations, annuities, titles of honor, etc. These are variously classified as real or personal property.

In Scots law the word "movables" is used as contradistinguished from heritable property, and is practically synonymous with personal property in American and English law. See CHATTEL; PERSONAL PROPERTY, REAL PROPERTY

MOVEMENT. Several modes of movement are manifested in plants and plant organs. Some of the lower forms (bacteria, algæ, and fungi) exhibit movements of locomotion in certain stages, swimming freely in the water in which they are found. The same is true of the zoöspores and conjugating sexual cells (gametes) of many plants which themselves are not motile. Also, the plasmodia of slime molds show a peculiar flowing of the protoplasm which results in motion from one place on the substratum to another. This is called amœboid movement. (For directive locomotor movements see CHEMOTAXIS, PHOTOTAXIS; TAXIS; ETC.) Another kind of movement often met with in plants is the so-called hygroscopic movement. This is shown by the awns of certain grasses and other fruits (seeds) (Fig. 1), by the valves of many seed pods (Fig 2), by the teeth of the peristome of moss capsules, and by the elaters of liverworts, hoisetails, (*Equisetum*), etc. It is a phenomenon having no connection whatever with the vitality of the parts, being due merely to unequal swelling or shrinkage (i.e., warping) of the different tissues by reason of their unequal

that exhibited by the leaves of the so-called sensitive plants. The best example of this is found in the mimosa of greenhouses. When this plant

FIG 2 HYGROSCOPIC MOVEMENTS OF THE VALVES OF SEED PODS

1, *Campanula ranunculoides* a, when dry, b, when wet.
2, *Linaria macdonnii* a, when dry, b, when wet

is jarred, struck, locally burned, or injured otherwise, its leaves suddenly collapse, even those at a distance from the shock. Its leaves are doubly compound, and in closing the pinnules rise so that the upper faces of opposite ones are brought together, the pinnæ drop downward and forward, while the whole leaf sinks (Fig. 3). If a shock be given to one pinnule, the disturbance there set up, if severe enough, is propagated to other parts of the same leaf and

FIG. 1 FRUIT OF *ERODIUM GRUINUM*

a, when wet; b, when dry, the straightening of b when tip is caught in grass and the awn absorbs moisture bores the seed-containing lower part into the soil and so plants it.

absorption or loss of water; and this depends on the unlike composition of the material of the cell walls.

From a physiological point of view perhaps the most important form of plant movement is

FIG 3. LEAF OF THE SENSITIVE PLANT (*Mimosa*).

a, in light when undisturbed, b, after shaking.

even to other leaves. Almost any portion of the plant can receive a stimulus in this way and pass it on to other regions. The organs which execute the visible response are motor organs (see MOTOR ORGAN), cushions of tissue (pulvini) situated one at the base of the leaf, of each

pinna, and of each pinnule. Indigenous plants which show this reaction, though not so strikingly, are the common oxalis and different species of *Cassia*.

The so-called "sleep movements" of leaves of the pea family, *Oxalis*, etc., are executed by the same motor organs, which, however, are often less perfectly developed. These movements consist of changes in the position of the leaf following variations in the intensity of illumination, so that these leaves have a nocturnal and a diurnal position. Hence the misleading expression "sleep movements."

For a discussion of the variety of movements of plants in response to stimulation, which are brought about by unequal growth on opposite sides of an organ, see CHEMOTROPISM; ELECTROTROPISM, GEOTROPISM IN PLANTS; HELIOTROPISM; RHIZOTROPISM; THERMOTROPISM. See also LOCOMOTION; MYXOMYCETES; ROTATION; SLEEP OF PLANTS.

MOVEMENT. A musical term denoting a division of a cyclical composition. As early as the sixteenth century a number of dances were loosely joined together, the only rule followed being that all should be in the same key and that the tempo (fast, slow) should alternate. This gave rise to the suite (q.v.), but the modern symphony or sonata was developed from the old overture, which consisted of three parts, a fast one followed by a slow one with the first part repeated. Gradually the three parts were separated and became distinct movements. In the sonata the first movement is always written in a particular form called sonata form. The different movements are in different (but related) keys. The first and last are always in the same key, which is therefore spoken of as the key of the cyclical composition. When the first movement is in the minor, the last is generally in the relative major. Each movement has its own themes. Occasionally, however, a composer introduces in a later movement (generally the finale) a theme from a former movement. The number of movements depends upon the character of the composition. In works written in sonata form the usual number is three for sonatas and four for symphonies. In suites the number varies from four to eight. See FORM; OVERTURE; SONATA; SUITE; SYMPHONY.

MOVEMENT, PERCEPTION OF. We may perceive movements of a part of the body, movements on the surface of the body, and movements of objects in space, i.e., we may have kinæsthetic, cutaneous, and visual perceptions of movement. Psychologically, movement is a composite perception made up of spatial and temporal perceptions (See DURATION; EXTENSION; LOCALITY.) When we perceive an object as moving, it occupies different positions in space during a certain time. But the characteristic thing about the perception of movement is that there is no successive localization of an object, with temporal pauses between; the object is perceived as changing its position continuously; and it is the continuity of movement, therefore, that first offers itself for explanation. It has been held that the sensory basis of continuity is to be found in the positive afterimage. (See AFTERIMAGES.) Since sensation continues for a time after the cessation of stimulus, the gap between the sensations set up at the beginning and end of the movement is thus filled in, and changes in the intensity of

the afterimage, aided by cortical disposition, furnish the necessary clews for the perception. In the cutaneous and kinæsthetic fields this theory seems adequate to the facts; but in the case of visual movement there are difficulties. It is well known that, if discrete phases of some objective movement be thrown upon the retina in rapid succession, by an instrument like the stroboscope or the moving-picture machine, the perception of movement will result. This illusion was formerly explained by reference to the positive afterimage, but recent experiments discredit that theory completely by showing that perceptions of movement may be obtained from nonmoving objects. If, e.g., a short vertical line is drawn at the end, and a short horizontal line at the middle, of a stroboscopic strip, and if the strip is revolved slowly in the cylinder, the two lines appear, successively, as discrete objects; if revolved rapidly, the two lines appear as a right angle, but if it is turned at a rate between these two extremes, the lines are seen to move, the vertical turning down, the horizontal up, through the angle of 90°. Afterimages are out of the question, and explanation by way of cortical disposition fails because the experience seems to be entirely new. An hypothetical movement centre in the brain has been suggested; but a more likely theory supposes a cortical short circuit.

Numerous experiments have been made to determine the quantitative aspects of the perception of movement, its extent and duration. Estimations of the extent of the movement of some part of the body appear to be founded on a fusion of articular, muscular, and tendinous sensations, and perhaps also cutaneous pressure (See MUSCLE SENSE.) The actual liminal excursion has been found to be least in the case of the larger joints (0.22° to 0.60° for shoulder, hip, elbow), greatest for the smaller joints (0.50° to 1.30° for knee, finger, ankle).

But our ideas of the extent of movement are not limited to those which refer to members of our body; we can also estimate the extent of the movement of an object felt (skin) or of an object seen (eye). A stimulus moving over the skin excites end organs of pressure which possess different "local signs." If the first local sign has not lapsed from consciousness when the last is reached, we are able to estimate the extent of the movement in purely cutaneous terms; otherwise we may make judgments in visual terms. The least noticeable extent of cutaneous movement depends upon the place stimulated, the intensity of the pressure, and the rate and direction of the motion. On the forehead it may amount to 10 millimeters. A very slow movement may pass unnoticed. Movements lengthwise of a limb are less readily noted than movements crosswise, on account of the distribution of the nerve endings in the skin. Movement is often noted before direction of movement, either because the starting point is forgotten or because the judgment "movement" is more easily aroused than the judgment "movement in this direction." The visual idea of extent of movement may be variously formed. 1. If the eyes remain fixed while the object moves across the visual field, the estimation results from the stimulation of different local signs in a manner analogous to that of the purely cutaneous estimation. At the fovea the least noticeable amount of movement is probably about equal to the minimum visible;

but in indirect vision it is only about a quarter of the limen of spatial duality. (See *EXTENSION*.) 2. If the fixation point of the eyes follows the moving object, the estimation of the extent of movement of the object is made in terms of the strain, pressure, and articular sensations evoked by the movements of the eyes in their sockets, of the head upon the shoulders, or of the body as a whole. Without the aid of some fixed point of reference, such as is actually used in eye measurement (see *EXTENSION*) and convergence, estimations of this second type are extremely uncertain, on account of the occurrence of unnoticed movements of the eyes themselves.

Turning to the temporal aspect of the perception of movement, we can say in general that quick movements are more readily noted than slow, whether they appeal to subcutaneous tissues, skin, or eye. On the skin a uniform rate in the stimulus is not perceived as a uniform rate in sensation, for a given movement appears more rapid where localization is more accurate. The slowest perceptible visual movement is at the rate of 0.0028 millimeter per second. In discriminating between two different rates the optimal speed is rather slow, because rates of movement which are at all quick are confused by the persistence of the excitation in the form of afterimages.

Finally, rate of movement, or, more strictly, a change in the rate of movement of the body as a whole, is perceptible, although no estimation of the extent of such a movement is possible. Upon vehicles like elevators, boats, etc., where there is little jar, it is easy to observe that, once the speed is uniform, it is impossible to perceive any motion, acceleration or diminution of this rate, however, sets up certain sensations due to the inertia of the body, and perhaps, too, other sensations mediated by the semicircular canals and otolith apparatus. See *STATIC SENSE*.

MOVERS, *mō'vērs*, FRANZ KARL (1806-56). A German divine and Orientalist. He was born at Koesfeld, Prussia, and was educated at Münster and Bonn. After being settled for six years over a church in Berkum, he was in 1839 appointed professor of Old Testament theology in the University of Breslau, where he remained until his death. His elaborate and scholarly treatise on the Phœnicians, *Die Phönizier* (vol. i, 1841; vol. ii, 1849-56), and as addition *Phönizische Teate* (1845-47), is his best-known work. He also wrote *Kritische Untersuchungen über die biblische Chronik* (1834) and the important dissertation *De Utriusque Recensionis Vatinorum Jeremiæ Indole et Origine* (1837).

MOVILLE. A seaport, market town, and summer bathing resort in County Donegal, Ireland, on Lough Foyle, 17 miles north-northeast of Londonderry (Map Ireland, D 1). It is noted as a port of call of the Anchor and the Allan line steamers from New York to Glasgow. Pop., 1911, 1016.

MOVIMAN, *mō-vē'man*. The language of the Movinas (Mobinas) of Bolivia, South America, on the shores of Río Mamoré and Río Yacuma, about lat. 14° S. They are now civilized and very cleanly. Vocabularies of their language show but faint resemblances with any other. Consult D. G. Brinton, *The American Race* (New York, 1891), and A. F. Chamberlain in *Journal de la Société des Américanistes de Paris*, N. S., vol. vii (Paris, 1910).

MOVING-PICTURE PLAY. The moving-picture play as a distinct artistic form grew out of the moving picture in much the same way as the regular drama developed from the crude mimicry of early times. The process of evolution in the one case, however, occupied only a few years, while in the other it extended over centuries. Just as the most primitive forms of drama were probably no more than rude attempts to portray or caricature actual events in the lives of persons and animals, so the first moving pictures were mere photographic transcripts from life, with little or no attempt at artistic arrangement.

But when the public had once become accustomed to the novelty of the moving picture there was a natural falling off in attendance at the places of exhibition, and it became necessary to invent some further means of entertainment. The exhibitors hit upon the obvious device of telling a story by means of the pictures. At first the attempts were confined largely to broad comedy or farce of the slap-stick variety, but the popular success of these crude efforts opened the eyes of both public and producers to the artistic possibilities of the new form of entertainment, and photographic dramatizations of popular stories and plays began to appear.

These attempts at story-telling were decided improvements over the original pictures. They were far from satisfactory, however, because the producers had not yet realized that a new technique was necessary and were trying merely to duplicate the effects of the legitimate stage. It was only after long experiment that the advantages and limitations of the art as a distinct form revealed themselves and the moving-picture play as we know it to-day was evolved.

Technically the new form is perhaps more closely related to pantomime than to drama. There is this essential difference, however: in pantomime we accept the convention that there is a race of beings whose natural language is gesture and who are therefore capable of expressing all their thoughts and emotions without the assistance of words, while in the motion picture we imagine the characters to be speaking as in ordinary life though, by convention, we are unable to hear them.

It is this convention of silence which has imposed the chief limitations on the moving-picture play as an artistic form. An effort has been made to overcome it by the introduction of the phonograph as an accessory, but so far the results have been unsatisfactory. So long as the characters in the moving-picture play can express nothing that cannot be conveyed by

means of gesture or facial expression the moving-picture playwright is necessarily limited in the choice and treatment of his theme to the more elemental emotions. The moving-picture play does not, therefore, attempt to deal in psychological subtleties or nice shades of character, but relies for its effect mainly on plot, as does the pantomime. It has an advantage over pantomime, though, in its use of captions or leaders. These are printed matter—inscriptions, letters, dialogue, headings, etc.—thrown on the screen to explain a scene or sequence of scenes that would not be intelligible from the acting alone. The tendency, however, is to dispense with these devices wherever possible and allow the story to unfold itself in action.

In structure the moving-picture play follows the Elizabethan rather than the modern tradition. Change of scene is frequent, and there is no obligation on the part of the playwright to arrange the events of his story so as to fall into the ordinary divisions of time and space which is obligatory to the contemporary legitimate dramatist. If in the course of the play some of the characters move from Europe to America, the spectators may take passage with them and witness the events on the journey. If the hero and heroine steal into the garden for five minutes, they may follow and see precisely what happens instead of trusting their report when they return to the drawing room. This flexibility of form lends an impression of greater continuity in action and makes possible a wealth of detail and added air of veracity that renders the moving-picture play a dangerous rival to the type of regular drama in which character and psychology are subordinate to plot. Already there is a tendency on the part of writers of melodrama to imitate the dramaturgy of the moving-picture play. It is too early to forecast the result. They can scarcely hope to rival the camera in this field, any more than to invade the domain of psychology and character analysis.

MOVING PICTURES. The representation, suitably enlarged on a screen, of a series of photographs of objects in motion made on a ribbon-like film of sensitized celluloid, by

the exposure, a rotating shutter, an integral part of the machine, in the meantime operating to prevent access of light to the film during the time required to move it into position for the next exposure. After the film negative is developed, a positive is made by contact printing on a similar kind of film, and the latter, wound on a reel, is placed in a machine in which it is unwound, and while kept at a proper degree of tension it passes through a projection lantern provided with a powerful light. The magnified image of every picture on the film is projected in succession upon a screen or white surface in a darkened room, where the resultant effect, viz., the illusion of the representation of objects in actual and natural motion, may be observed by a large number of persons at one time. The sensitized films are made about 1000 feet in length, each picture is $\frac{3}{4}$ by 1 inch in size, the standard aperture on the projection machine being $\frac{1}{4}$ by $\frac{1}{8}$ inch.

The moving-picture illusion depends upon the fact that an impression received by the retina of the eye lasts for a short interval after the stimulus giving rise to the impression has ceased. This is commonly known as the persistence of vision, and its duration may vary from one-tenth to about one-fiftieth of a second. In the early part of the nineteenth century several interesting pieces of scientific apparatus were developed for combining a series of pictures representing bodies in motion, which produced the illusion of motion. One of the earliest of these was the stroboscope (q.v.), which consisted of a disk having a series of radial slits cut near its circumference. Representations of successive phases of a movement when rapidly moved as on the periphery of a second disk and viewed through these slits in the first disk also in revolution had an apparent motion that depended upon the relative motion of disk and moving body.

About 1845 the zoetrope was developed, consisting of a cylinder revolving on a vertical axis and having a number of vertical slits cut near the top. On the inside surface of the cylinder was placed a strip of paper having on

MOVING-PICTURE MACHINE—PRINCIPLE OF OPTICAL PROJECTION.

means of a specially constructed camera, containing mechanism for alternately exposing and moving the film at a high rate of speed, in connection with a revolving shutter which prevents access of light through the camera lens to the film while the latter is being shifted from one position of exposure to another. In making the original photograph the film is placed on a reel in the camera and unwound by a hand-driven mechanism that advances it into a position where it is momentarily stationary during

it a series of pictures representing an object in successive stages of motion, as, e.g., a horse running. An observer looking through the slits at the moving picture inside the cylinder saw the object apparently in motion repeating the cycle of movement with every revolution of the apparatus. See ILLUSTION.

In 1877 Eadweard Muybridge, in America, made a series of photographs of horses in motion, employing glass dry plates, as at this time sensitized films had not been invented.

The horses were photographed at various points of their progress around a race track by placing along the track at certain intervals a battery of cameras in proximity, whose shutters were operated by a string broken by a horse as it passed along. In this way was secured a series of pictures which, while they showed the true position of the animal from the particular spot where the camera was placed at given instants, did not contain the essential elements of true moving pictures, as there was no exact regularity in the interval between exposures. Incidentally, however, they aroused a great deal of discussion among anatomists and artists, and settled conclusively some questions that had been in dispute between them. These pictures if combined did not possess that continuity of succession necessary to furnish the illusion to an observer of the horse moving in a natural manner, for in making the originals there was a space between any two cameras in which the position of the horse was not photographed, consequently on combining these successive camera records they were not consecutive. At the time the pictures were made, however, they marked a decided advance in the art of photographing objects in motion.

The kinetoscope (q.v.), brought out by Edison in 1893, and independently developed in a modified form by Lumière, Paul, and others shortly after, comprised a machine operated by hand or by electric motor for moving a transparent film in front of an aperture, through which an observer might view a consecutive series of pictures by the aid of a lens,

DOUBLE-CONE SHUTTER OF PROJECTION APPARATUS

Position of the shutter when intermittent sprocket stops. The small wings pass in front of the light aperture when the film is moving.

suitable illumination of the film being provided. A modification of this apparatus allows the image of the film enlarged to be thrown by a suitable lantern so as to form magnified images of the photographs upon a screen. This in essence is the modern moving-picture machine. When projected at the rate of 16 to 20 pictures per second, one visual impression does not entirely die out before another succeeds it, and the illusion of actual motion results.

The shutter of the projection lantern interrupts the light for the short interval of time necessary to move the film into a new position and avoids blurring of successive impressions in the mind of the observer. Thus the motion of the film in a projection machine is an intermittent one, each picture being projected on the screen for an instant; then, the shutter

coming into operation, the film is shifted so as to place the next picture in position for projection and the shutter opened, repeating the

MOVING-PICTURE CAMERA.

operation to the end of the film. A slower speed than 16 per second causes an impression of flicker and fatigue to the eye and produces an unsatisfactory picture. For the same reason it is possible for special purposes, as well as for grotesque and comedy films, so to speed up the projection machine that the objects appear to move at an exaggerated velocity not attained in the original motion.

COMPLETE INSTALLATION OF PROJECTION APPARATUS.

For the actual taking of the pictures there have been developed many ingenious forms of cameras following the fundamentals already

outlined, but carefully perfected as regards mechanical details and facility of operation. This is true not only with regard to the demands of the great moving-picture industry but also with reference to portable designs for military and aeronautical purposes, as well as for the study of wild life, exploration, etc.

Likewise projection machines have been developed to a high degree of mechanical perfection. Since the magnification of the pictures is very great, approximately 35,000 times, any minute defect in the machine that would produce an irregular feeding of the film, or cause a sudden jar or vibration to it, is intensified in the same proportion on the screen. While these machines are built to operate either by hand or by an electric motor, the former mode is often prescribed by city ordinances on account of the necessity of stopping instantly in case the film catches fire. The films are made with a row of perforations on each edge, which are engaged by the teeth of sprocket wheels on the machine, both above and below the lantern aperture, to insure a uniform rate of feeding and withdrawing the film and to avoid the buckling or undue accumulation of it at places where it would be likely to become ignited and cause a panic in the audience.

Until a short time ago fires in moving-picture theatres were of common occurrence, originating at or near the projection machine and caused by the ignition of the film. The usual cause was an accidental stoppage of the motion of the film by some defect in the machine itself or by carelessness or inattention on the part of the operator, for as soon as the film stops, the heat radiated by the arc lamp and concentrated by the lens on the film develops such a high temperature that the latter may be instantly ignited, unless an automatic shutter, to operate the moment the film stops, is provided. Another cause of such fires is insufficient protection afforded the film after it has passed in front of the lens. If it is exposed underneath the projection machine, it may become ignited by an incandescent particle of carbon thrown off from the arc lamp. The danger of fire and the more serious panic incident to the ignition of the film has been largely diminished by inclosing the machine and operator in a noncombustible booth or compartment of tile or asbestos, to which no one but the operator has access, and providing it with a small window through which the light from the lantern may pass to the screen and with a noncombustible door that must be kept shut. By better design and construction of the machine, providing more perfect protection of the film, by causing it to pass through narrow slots or fire gates above and below the beam of light, and by a metal shutter which automatically drops between lens and film the mo-

ment the latter stops, fires have been reduced in number, and insurance and State or municipal regulations are now generally quite strict and enforced in this field.

The human as well as the mechanical features also have received attention, and the complication of apparatus involved in projecting moving pictures has led to the development of a class of employees as operators that possess considerable experience, judgment, and skill in securing uniformly satisfactory results on the screens. These men are often recruited from spot-light operators and electrical workers of the stage, and while the

MOVING-PICTURE-PROJECTION APPARATUS
Detail of film-operating mechanism

work does not involve delicate manipulation or expert scientific knowledge, there is, nevertheless, a noticeable difference in the results of the work of different operators with the same film. The proper adjustment of the latter in the projection machine, the correct and uniform speed of running it, in addition to cool-headedness in case of film fire or other mishap which might result in panic, are the requirements that should be possessed by the most successful operators.

In spite of precautions, fires sometimes occur in the operator's booth, and prompt and intelligent action by the man in charge of the projection machine often has prevented a panic that might have resulted disastrously, yet actually in many cases has caused but slight

interruption to the exhibition of film pictures. In the larger American cities the operators receive a salary of from \$20 to \$35 a week, their work including both afternoon and evening representations.

The growth of the moving-picture business has been phenomenal the world over. It is difficult to obtain exact figures either of the amount of capital invested in the business or of the daily or annual attendance at the theatres. With the development of the industry and the excellence of the pictures and plays, the number of persons attending moving-picture theatres is increasing rapidly. In the cities of New York, Chicago, and Philadelphia the average daily attendance in 1915 was estimated at considerably more than 750,000 in each, and in the whole United States it was estimated that the daily attendance averaged about 5,000,000 persons. The amount of money invested in the business of making, developing, and exhibiting moving pictures is very large. In 1913 there were in the United States 319,000,000 paid admissions to such theatres, not including those houses that had substituted moving pictures for the ordinary drama or vaudeville. The consideration of the average cost of producing photoplays and building or altering theatres for exhibiting them led to the estimate of about \$400,000,000 as the amount of money probably invested in the business in the United States in 1915, although the number of new enterprises constantly undertaken and the absence of any regular system of reporting the costs and investment of each make such an estimate rather inaccurate. It is considered lower rather than higher than the actual amount.

In 1914 the distributors for three of the largest manufacturers, who handled 75 per cent of the films issued, were reported to have done a business of \$15,000,000. Many of the films produced in the United States are exported and distributed in foreign countries, the larger part during 1914 being sent to Great Britain and her colonies. In the calendar year 1913 there were 145,436,783 lineal feet of film, exposed and not exposed, valued at \$5,291,464, exported from the United States. During the year 1914 the number of lineal feet exported amounted to 117,580,304 feet, having a value of \$4,742,620. Moving-picture films are manufactured of a standard size and material so as to be available for use in every country in the world. This feature adds enormously to the facilities for an interchange of films, and the productions of European as well as of American studios are found in the Far East and in South America and Africa.

Most of the films produced by photoplay producers are purchased from a few large manufacturers of such product. A few of the producers distribute their films directly for public exhibition, but the majority of them release films through the medium of exchanges or local distributors, some 40 different exchanges handling the output of 25 manufacturers.

While many inventors have made machines and devices for connecting moving-picture projectors with talking machines, many of which have been extensively exhibited, it is difficult to make the combination a satisfactory one. Perfect synchronism and the reproduction of the tones of the voice in their original quality and sufficiently loud to be heard in every part

of a theatre are very difficult to attain. Perfect voice reproduction is not considered impossible, however, and inventors' efforts are being continued, as is evidenced by several recent patents. Edison's kinetophone (q.v.), first put before the public in 1912, proved moderately successful, but still defective in the quality of voice reproduction and sometimes lacking in synchronism. About the same time that Edison attacked the problem Gaumont and Clermont-Huet in Europe were endeavoring to construct talking picture machines. It can be readily understood that when the moving-picture machine and the phonograph are mechanically connected, any slip or imperfection of the parts will cause one to get out of time with the other, and for this reason simple mechanical connections for this purpose have been practically abandoned. A type of apparatus for the electrical control of one machine by the other, devised by Gaumont, in its latest form accomplished the result of uniform operation of the two machines by controlling the motor driving the projection apparatus by means of a current obtained from the armature of a motor generator attached to the operating shaft of the phonograph. Another talking moving-picture machine which promised excellent results operates on the principle of controlling the projection apparatus by means of a current derived from a commutator on the shaft of the phonograph motor. This commutator has six sections, each one of which is connected with an electromagnet or solenoid having an iron plunger connected to a crank on the shaft of the projection machine. Thus each one of the magnets of this solenoid motor is actuated by current derived from any convenient circuit controlled through its respective section of the commutator on the shaft of the phonograph so as to produce perfect synchronism of projector and talking machine.

Often it is advantageous to show moving pictures in daylight. The use of a translucent screen, said to resemble parchment, and which is also fire and water proof, has been tried, the pictures being projected on the screen from behind, and the audience or a class under instruction sitting in front are enabled to make notes or refer to books, etc.

Photoplays. It is in connection with the representation of dramatic scenes in the form of so-called photoplays that the moving-picture industry finds its widest application. Depicting current events in this way of course aroused interest, but this does not bulk large in connection with the portrayal of successive scenes from some new or standard play in which the action follows along rapidly and emphasizes the dramatic succession of incidents. This involves the reduction of a play to a simple scenario or story, or it may be the construction of a scenario or outline from new and original ideas. Once this is done the work of staging and photographing the scenes must be started. This involves large expense and considerable time, as many of the situations may be modified as the work proceeds, to give them proper dramatic value and effect. For production on the large scale that is now necessary, when moving-picture plays as regards not only elaboration but even in prices charged for admission and seats are in some cases put on a level with actual stage productions, extensive

workshops and large studios are increasingly common. Several photoplays may be in process of production simultaneously, and a large force of costume makers, scene painters, and other assistants are employed, together with the necessary workshops for developing and finishing the films as rapidly as possible. The expense of the duplication of a film, once it is made, is not large proportionately, and as soon as films are released for rental the profits, according to the popularity of the subjects, are very large. When a film has been made and found satisfactory for exhibition it is imprinted with the name of the manufacturer and copyrighted. A film may be run about 500 times in the hands of a careful operator before its condition renders its projection unsatisfactory by reason of streaks and spots that appear greatly magnified upon the screen, in addition to which there is a certain increased fire danger from the frayed and split condition of the edges when exposed to the intense heat in front of the lantern.

The original photographs are made not only in large moving-picture studios that have become so common, but it is often desirable to transport a company of actors long distances to make even one reel under the exact natural surroundings called for by the story to give it a proper historical setting. Thus, some films have been made in the desert of Sahara, at Bermuda, or in the most inaccessible portions of the Alps. In the United States moving-picture companies have often been sent from New York to the cañons and prairies of the Far West, to the battlefield of Bull Run, or to Fort Ticonderoga, in order to secure a natural setting and the required realism of surroundings. All of this of course is one of the incidental expenditures in the production of photoplays and one that involves a large sum. It is generally conceded that European producers devote more time and attention to artistic setting and harmonious surroundings, as well as lighting and technical details, than the controlling interests in the United States, authoritative critics considering that European films possess many points of superiority over those staged in America.

The great variety of subjects for film plays, many of them of an objectionable character, led in 1909 to the organization of the National Board of Censorship, at the request of the proprietors of many moving-picture theatres in the city of New York. This is a voluntary, unofficial group formed by the People's Institute in that city. Soon after it began its efforts the value of its work was so highly appreciated that it became national in character and extent, securing increasing control over films exhibited in the United States and cooperating with smaller boards organized for censoring purposes in other cities. No member of the board is engaged in the moving-picture business, its members being drawn from the ranks of professional and business men and women, social workers, and many others interested in the problems that have been brought up by the development of the moving picture. Members of the board serve without compensation, and there is a censoring committee of 105 members. To form some idea of the amount of work that must be accomplished by this body, it may be noted that there were in 1915 nearly 150 new film subjects placed on the market each week

by producers, and as the tendency was towards subjects often requiring from 6 to 10 reels, and as each reel is about 1000 feet in length, the amount of examination that must be made of this product can be seen to be very large. The censors view the film in the studio of the producer, and about 95 per cent of the entire product of the United States comes before them. Recent experience has shown that about 90 per cent of the films reviewed have been satisfactory, requiring neither change nor condemnation. As the amount of film produced in 1913 was 63 per cent greater than during the preceding year, the demands upon the services of the board increase rapidly. The work of the National Board of Censorship is to approve or condemn, merely recommending changes deemed necessary, as it is not clothed with legal power directly to prevent the production of an objectionable film.

The necessity for a board of censors has been widely felt, and in at least seven States legislation looking to the formation of such a body was attempted. In four of these States the measure was enacted into law, but met with a great deal of opposition, and in one or two States its constitutionality was in litigation in 1915. In the Sixty-third Congress a bill was introduced creating a national or Federal commission for the purpose of censoring and licensing all moving-picture films. Many hearings were given upon it, but at the end of the session it was referred to the Committee on Education and did not secure passage.

In the earlier development of moving pictures the plays presented were generally of simple themes. As a dramatic work the earlier photoplay was crude and constructed with little idea of being more than a thriller or for the purpose of filling in between vaudeville acts. After the spectacular novelty of the "movies" began to wear off it was realized that to interest and hold the more intelligent and discriminating portion of the public it was necessary to secure plays of some depth and permanent value, those that not only appealed to the emotional nature, but that would present to them questions touching everyday life and experience. The popularity of the railway wreck, the cowboy, Indian, or other dramas lured in scenic features and action, was only transient, and various other topics, such as the drug and drink habits, the white-slave traffic, highway robbery, etc., all in turn exploited, gave place to others of more permanent value and better moral tone. Many of the reels depicting phases of depravity were crudely made, and while the original acting was good of its kind, yet, in attempting to point a moral or convey a great lesson, the producers usually overdid the matter, portraying incidents the truth of whose existence could not be denied, but which were unnecessarily raw and base. In their rush to make a success commercially the film producers accepted scenarios often treating, or at least containing broad allusions to, some form of depravity and crime intended to convey a moral lesson, but which in other respects had no claim to dramatic recognition.

While recent changes in the quality of photoplays have been in the direction of more serious subjects and those also of more permanent value dramatically, nevertheless it is difficult to understand, after all, why depict-

ing scenes on the film is more attractive to most people than the usual manner of portraying the events by spoken language and the usual scenery. If it is the appeal of realism in the film play, then it would seem that colored moving pictures would have increasing popularity, but such is not the case, as managers of such theatres assert that the colored films, which were best represented by the kinemacolor (qv) pictures, are losing popularity as compared with the black and white. For the characters in the photoplays it formerly was deemed sufficient to engage the services of almost any one who offered himself for the work; and while some films of the cheaper productions are made with the aid of persons who are not sufficiently skilled in dramatic art to get a decent living on the regular stage, yet for the more serious kind of work, the longer and more important plays, the dramatization of great works of fiction, and other special-feature films, an endeavor has been made to secure the best talent available, as is evidenced by the names of well-known actors and actresses associated with photoplays.

For the purpose of accompanying many of the photoplays special incidental music has been composed, but for the ordinary run of films an endeavor is made to use existing music suited to the subject. Among the serious successes where dramatic value or extensive elaboration has prevailed may be mentioned the dramatization of Sienkiewicz's *Quo Vadis* and Hugo's *Les Misérables*; *Cabiria* by D'Annunzio; *Last Days of Pompeii*; Madame Bernhardt in *Camille* and in *Queen Elizabeth*; James K. Hackett in *The Prisoner of Zenda*; *Arizona*; *Soldiers of Fortune*; *Rose of the Rancho*; *Scars of the Mighty*, *Birth of a Nation*; and many others.

In the light of the constantly increasing attendance at moving-picture theatres it is interesting to inquire the cause of this popularity. Every possible subject seems to have been covered by the films, from the daily news service to religious, historical, and other educational subjects; in addition to sports, travel, military and naval events, fiction, comedy, tragedy, and the romantic drama. The audiences are cosmopolitan, composed of persons of all ages, nationalities, and conditions of life. The low price of admission originally and usually prevailing as compared with that charged at regular theatres attracts many in search of diversion. In this connection, too, and for this same reason, entire families who would otherwise seldom go to an ordinary theatre are enabled to attend. Many of the persons in the audience are merely endeavoring to pass the time with the aid of the pictures shown, though not deeply interested in the subjects. Others again seek the moving-picture house as a means of mental relaxation, and still others go who are in search of excitement—persons to whom the emotional appeal of the films is undoubtedly strong. Comparing the photoplay with the legitimate drama, the most telling points in the former are made by the obvious situations, those that cannot or need not be amplified by spoken language, where even the slightest exaggeration of facial expression or gesture conveys the intended meaning in unmistakable terms. Naturally plays that depend for their success mainly on light, witty dialogue are hardly susceptible of film

treatment, as the film cannot properly interpret them.

Aside from dramatic representations moving pictures are widely employed. The safety-first movement makes use of moving pictures to represent safe and unsafe methods of working in the vicinity of moving machinery, belts, gears, etc., as well as demonstrating how to avoid dangers that are constantly present to railroad men and industrial workers in their regular work around cars and engines and machines. Important commercial use has also been made of moving pictures, since a salesman, by means of a portable projection outfit, can not only show the variety of goods manufactured or sold by the firm employing him, but can also make clear if necessary every step in the manufacture and marketing.

Although at first used as a means of popular amusement, moving pictures soon were found adapted to purposes of instruction. Educationally the value of properly prepared films on a large number of subjects has been increasingly appreciated, particularly in technical schools and universities. The processes of mining, smelting, and refining of ore and the manufacture of the metal into various forms, the action of complicated pieces of machinery or machine tools, or a surgical operation illustrating the operative methods in use in various cases, can all be shown by a series of moving-picture films to large classes with great facility and advantage. Among topics that have achieved wide popularity are those showing the work of boy scouts, of fresh-air-fund committees, crusades against tuberculosis, typhoid, and other diseases, how communities combat the danger of impure milk and of infection from flies and other insects, unhygienic housing conditions; harvesting and handling of grain; collection and manufacture of silk, etc. In addition there are illustrated Bible stories, also historic biographies, such as those of Lincoln, Washington, and other famous characters, and, where the attendance is composed largely of industrial workers and their families, first-aid methods in cases of accident and injury are often shown.

With a judicious selection of subjects moving pictures have been employed for the diversion and amusement of the inmates of penal institutions and insane asylums with good results. In the Montana Penitentiary and at Sing Sing, New York, films have been shown regularly every Sunday, and all convicts with a record of good behavior during the week were allowed to witness them.

For instruction in rifle practice moving-picture films representing moving persons and objects, bodies of cavalry, artillery, etc., are projected upon a background of scenery representing some locality unfamiliar to the troops who are being instructed. The background or screen is in semidarkness in order that the objects to be fired at may appear more distinctly, but the men at the firing line are in daylight, so that there is no difficulty in sighting the rifles. The projection apparatus is arranged so as to permit stopping the film long enough to show the location of the hits on the various parts of the target. After recording these the film is moved on and firing proceeds.

Some highly successful results have been secured in making pictures under water. The

camera is placed in a closed, water-tight compartment, lowered into the water from a boat. This chamber is provided with a plate-glass window, in front of which a number of powerful electric lights are suspended, so as to illuminate any objects in the immediate vicinity with sufficient brightness to enable photographs to be made, even at depths as great as 60 feet, showing fish, plants, and other objects that otherwise could not be studied in their natural surroundings.

Bibliography. There is a constantly growing popular, as well as more or less technical, literature in this field available for consultation. There may be recommended the following: E. Muybridge, *The Horse in Motion* (Philadelphia, 1878); D. S. Hulfish, *Cyclopedia of Motion-Picture Work*, American Technical Society (2 vols, Chicago, 1911); F. H. Richardson, *Motion Picture Handbook* (2d ed., New York, 1912); *Moving Picture Annual and Yearbook* (ib., 1912 et seq.); Carl Froch, *Der Kinetograph und das sich bewegende Bild: Geschichte und technische Entwicklung der Kinetographie bis zur Gegenwart* (Vienna, 1913); F. A. Talbot, *Practical Cinematography and its Applications* (London, 1913); *Modern Bioscope Operator* (ib., 1913); J. A. Nelson, *The Photoplay: How to Write and How to Sell* (Los Angeles, 1913); E. W. Sargent, *Technique of the Photoplay* (2d ed., New York, 1913); Eisenstein and Leeds, *Writing the Photoplay* (Springfield, Mass., 1913); J. B. Rathbun, *Motion Picture Making and Exhibiting* (Chicago, 1914); Horstmann and Tousley, *Motion Picture Operation* (ib., 1914); J. H. Hallberg, *Motion Picture Electricity* (New York, 1914); *Kinetograph Year Book, Diary, and Directory* (London, 1914); *Kinetograph and Lantern Weekly* (ib., 1914 et seq.); also the following publications of the National Board of Censorship of Motion Pictures: Annual Reports of the Board, *Policy and Standards of the National Board of Censorship*, *The Question of Motion Picture Censorship*; *Suggested Ordinance and Requirements for Motion Picture Theatres*. See KINETOSCOPE.

MOVING PLANT (*Desmodium gyrans*). An East Indian plant of the family Leguminosae, remarkable, as are also some other species of the same genus, for the autonomic movements of the leaves, which are ternate, the lateral leaflets much smaller than the terminal one. These lateral leaflets are in constant motion, being elevated by a succession of little jerks, and then moving downward by similar rapid jerks. The terminal leaflet does not remain absolutely at rest, although its movements are not like those of the lateral ones. This is the most striking example of autonomic movements in plants. The movements are not very rapid, a complete up-and-down movement requiring two to four minutes, the fall being more rapid than the rise. The reason for these movements is unknown, nor are they known to be of any value to the plant. See MOVEMENT.

MOVING STAIRS. See ELEVATOR, *Escalator*.

MOWAT, mō'at, SIR OLIVER (1820-1903). A Canadian statesman, born in Kingston, Ontario, of Scottish parentage. In that city and in Toronto he was educated. He became a barrister (1841), practiced his profession in Kingston and Toronto, and was made queen's counsel in 1855. He was a Liberal member of the Canada Legislative Assembly for South Ontario

in 1857-64, Provincial Secretary in the Brown-Dorion cabinet in 1858, Postmaster-General in the Macdonald-Dorion cabinet in 1863-64, and a judge of the Court of Chancery for Ontario from 1864 until 1872. Before accepting a seat on the bench Mowat was a strong advocate of Confederation, and was one of the delegates to the Quebec Conference (1864) at which its fundamental terms were settled. Resigning from the bench in 1872, he was elected leader of the Ontario Liberals and became Premier of that province, which position he retained for the unprecedented term of 24 years. As Premier his administration was chiefly noteworthy for its defense of provincial rights, Ontario's contention against the Dominion being sustained in several cases by the final court of colonial appeal, the Judicial Committee of the Privy Council. The best known of these cases arose from the boundary dispute between Ontario and Manitoba (See MANITOBA, *History*.) Mowat also procured the passage of a large number of useful provincial laws. Legal reform early engaged his attention, and in 1856 he was a member of a commission for consolidation of the general statutes respectively of Canada and Upper Canada. During his premiership an act for the creation of a High Court of Judicature was passed, the object being the fusion of the courts of law and equity. In 1896 he was called to the Dominion Senate, where he became Liberal leader, also being appointed Minister of Justice in the administration of Sir Wilfrid Laurier. He was afterward Lieutenant Governor of Ontario (1897-1903). Consult J. C. Dent, *Canadian Portrait Gallery* (Toronto, 1880), and C. R. W. Biggar, *Sir Oliver Mowat* (ib., 1905).

MOWBRAY, mō'brā, HENRY SIDMONS (1858-) An American decorative and figure painter, born of English parentage in Alexandria, Egypt. He was brought to the United States in 1859. In 1878 he went to Paris, where he studied under Bonnat. He started as an illustrator and painter of subtly refined ideal subjects and portraits, such as "A Lady in Black" (Buffalo Academy), "Idle Hours" (National Gallery, Washington), and "Le Destin," and was the first director of the American Academy at Rome (1903). In later years he confined himself to decorative painting, in which he displays great artistic intuition, restraint, elegance of composition and draftsmanship, and warmth of tone. In his beautiful adaptations of Pinturicchio's frescoes in the Borgia Apartments of the Vatican for the Library of the University Club, New York, he has thoroughly grasped the Italian master's style, and his original lunettes are no less admirable than the copied panels. Other fine decorations include the frieze "Development of Law" in the Appellate Court, New York, mural paintings in the Congressional Library, Washington, the Federal Court, Cleveland, the library of J. Pierpont Morgan, New York (also ceiling), and the private residences of C. P. Huntington and F. W. Vanderbilt, New York, and of Larz Anderson, Washington. He was elected a National Academician in 1891 and received a gold medal at Buffalo in 1901.

MOWBRAY, ROBERT DE, EARL OF NORTHUMBERLAND. See NORTHUMBERLAND.

MOWER. See REAPERS, REAPING.

MOWER, mō'ēr, JOSEPH ANTHONY (1827-

70). An American soldier, born at Woodstock, Vt. He fought in the ranks during the Mexican War, but rose, in 1861, to be a captain in the regular army. During the first year of the Civil War he took part in the military operations in Kentucky and Tennessee, rendering conspicuous service. In November, 1862, he was promoted to brigadier general of volunteers, and was placed in command of a brigade before Vicksburg (1863). In 1864 he was promoted to the rank of major general of volunteers and commanded a division in Louisiana. Later he accompanied Sherman in the Atlanta campaign. Upon the reorganization of the army at the close of the war he was commissioned colonel of the Thirty-ninth Infantry and received command of the Military Department of Louisiana.

MOWRY, mou'ri, WILLIAM AUGUSTUS (1829-). An American educator and historical writer, born at Uxbridge, Mass. From 1854 to 1857 he studied at Brown University, from which he received an honorary A.M. in 1866. For many years he was engaged in educational work in Rhode Island and Massachusetts. In 1884-85 he was editor of the *Journal of Education* and from 1886 until 1891 of *Education*. He wrote: *Elements of Civil Government* (1890, new ed., 1913); *Talks with my Boys* (1892, 5th ed., 1909); *A History of the United States* (1896); *First Steps in the History of our Country* (1898; rev. ed., 1914), with A. May; *American Inventions and Inventors* (1900); *Marcus Whitman and Early Oregon* (1901); *The Territorial Growth of the United States* (1902); *American Heroes* (1903), with Blanche S. Mowry; *American Pioneers* (1905); *Essentials of United States History* (1906, rev. ed., 1914). *Recollections of a New England Educator* (1908).

MOXA. The downy hairs of *Artemisia moxa*, a plant of the family Compositae; also the plant itself. The Chinese and Japanese use this substance as a cauterizing and a counterirritant.

MOX'OM, PHILIP STAFFORD (1848-). An American Congregational clergyman, born at Markham, Canada. He came to the United States at an early age and a year after the outbreak of the Civil War joined the Federal army. In 1875 he entered the Rochester Theological Seminary, where he remained three years, then entered the University of Rochester, where he graduated in 1879. He was pastor of the First Baptist Church in Cleveland, Ohio, from 1879 until 1885, and of the First Baptist Church in Boston from 1885 until 1894, when he took charge of the South Congregational Church in Springfield, Mass. He was university preacher at Harvard in 1894-97. His publications include: *The Aim of Life* (1894); *From Jerusalem to Nicca: The Church in the First Three Centuries* (1895); *The Religion of Hope* (1896); *Two Masters: Browning and Turgenev* (1912).

MOXON, mōk'son, EDWARD (1801-58). An English publisher and minor poet, who went to London from his native Wakefield and, after some experience with Messrs. Longman, set up for himself as a London publisher in 1830, Samuel Rogers supplying the capital. A book of verse of his own, *The Prospect and Other Poems*, appeared in 1826. He published for a number of illustrious English authors, among them Wordsworth, Shelley, Browning, Monckton Milnes (Lord Houghton), Tom Hood, Lord Lytton, and Tennyson. An interesting

incident in his career was the suit which was brought against him on a charge of blasphemy for publishing Shelley's *Queen Ma*—a case which was successful and compelled the deletion of certain passages in number of subsequent editions. A second volume of Moxon's verse (1837) was combined with his first volume, the two appearing together in 1843. Moxon's business, as continued by Arthur Moxon and J. B. Payne, had among its publications Swinburne's *Atalanta* (1865). In 1871 the business of the Moxons was merged with that of Ward, Lock, and Tyler.

MOXOS, mō'hōs, MOJOS, MOJOS, or MUSU mō'soo. A noted group of tribes occupying the Province of Moxos, on the upper region of the Mamoré and Beni rivers, in northeastern Bolivia, and speaking a language of the wide spread Arawakan stock (q.v.). By submitting themselves to the Inca Yupanqui they became incorporated with the Peruvian Empire (see QUICHUA), and an Inca colony was established in the province. In 1564 they repelled a Spanish invasion of their country, but in 1674 readily accepted the teaching of the Jesuit missionary Baraza, who worked among them for nearly 30 years and succeeded in collecting them into 15 mission villages, at the same time teaching them agriculture, weaving, and carpentry. Moxos missions grew and flourished; other neighboring tribes being also gathered into them, until in 1726 their 15 villages numbered 30,000 Christian Indians, representing nearly 30 tribes and at least 9 distinct languages, the Moxos proper predominating. With the expulsion of the Jesuits in 1767 the mission period came to an end, but the former converts maintained themselves as a civilized population and exist to-day in practically undiminished numbers. Physically they are of rather light complexion, with intelligent and handsome features. They are grave and thoughtful, honest and devoutly religious, peaceable and civil, but carrying always an air of independence. They are successful farmers, expert boatmen, and skillful with the lariat.

MOYABAMBA, mō'ya-bām'bā. A town of Peru. See MOYOBAMBA.

MOYA Y CONTRERAS, mō'ya & kōn-trā'ras, PEDRO DE (c.1520-91). A Spanish prelate and administrator, born in the diocese of Cordova. He received the doctorate in canon law at the University of Salamanca and afterward held numerous ecclesiastical positions, including those of inquisitor at Saragossa and Murcia. In 1571 he was sent to Mexico, as chief inquisitor, to establish the Inquisition there. He became Archbishop of Mexico in 1573 and was Viceroy of New Spain during 1584 and 1585. He summoned and presided over the third provincial council of the church in Mexico (1585). After his return to Spain in 1591 he was appointed president of the Council of the Indies.

MOYNE. See LE MOYNE.

MOYNE, PIERRE LE. See IBERVILLE, SIEUR D'.

MOYOBAMBA, mō'yō-bām'bā, or **MOYABAMBA**. The capital of the Department of San Martín, Peru. It is situated in the northern part of the department, on the river Mayo and on a plateau of loose, sandy material, which the floods wash out, forming large ravines penetrating the town (Map: Peru, B 5). It has a fine healthful climate, with an average temperature of 77° F. The town consists

mainly of isolated houses thatched with palm leaves and scattered over a large area. The principal industry is the manufacture of Panama hats. Moyobamba has some trade with Brazil by way of the Amazon, with which the Mayo communicates through the Huallaga, but otherwise it is practically cut off from communication with the rest of Peru. Pop. (est.), 9000.

MOYSE, mwäz, HYACINTHE (1769-1801). A Haitian revolutionist, nephew of Toussaint L'Ouverture. In 1791 he headed a revolt against the whites and won the battle of La Croix-des-Bouquets, driving the whites into Port-au-Prince. This success was followed by a general revolt in the south and west, accompanied by massacres, executions, and devastation of the country. In 1794 he joined the party of Toussaint L'Ouverture (qv) and was made general of a brigade. He aided in the expulsion of the English (1798) and was commander of the Army of the North in the attack on Spanish Santo Domingo in 1801. Displeased at the despotism and usurpation of Toussaint, Moysé was accused of instigating a revolt in the north. He was arrested and court-martialed and with 23 of his men was blown from the cannon's mouth.

MOZAMBIQUE, mō'zam-bēk'. The former name of Portuguese East Africa (qv), now restricted to the northeast coast of that colony (Map: Africa, H 6).

MOZAMBIQUE. The capital of the Portuguese Province of Mozambique, situated on a small coral island separated from the east coast of Africa by a strait a mile wide, at the narrowest part of the Mozambique Channel (Map: Africa, J 6). Its principal buildings are the Governor-General's palace, the custom-house, the hospital, and the cathedral. It has three interesting old forts dating from the early sixteenth century, one of which is built entirely of stone imported from Portugal. Mozambique was formerly a centre for the slave trade and has declined in importance since that era. There is some traffic in rice, gum, gold dust, and timber; the shipping amounts to 150,000 tons annually. Pop., 1910 (est.), 362,000.

MOZAMBIQUE CHANNEL. The body of water between the east coast of Africa and the island of Madagascar (Map: Africa, J 6). It is about 1000 miles long, and its width ranges from 200 miles at the middle to nearly 600 miles at either end. The principal river flowing into it is the Zambezi. The Comoro Islands lie in the north entrance to the channel, and on the west shore are the ports of Beira and Mozambique. A warm current flowing through this channel strikes the Agulhas Bank to the south and produces in the shallows one of the roughest seas in the world.

MOZARABIC (mōz-är'ä-bīk) **LITURGY** (Sp. *Mozárabe*, from Ar. *Mustarb*, from *ta'arrab*, to become an Arab, from *'arab*, Arab), or GOTHIC LITURGY. The ancient liturgy of the Church of Spain. The former title is derived from the name applied to the Christian inhabitants after they were subjected to the Arab domination, the latter is applied to it because it was most widely used during the Gothic period. It is also called the Toledan or Isidorian rite. A common opinion has been that it was of Eastern origin and was brought by the Goths from Constantinople or Asia

Minor in the fifth century and then revised by St Isidore of Seville, but some recent writers regard it as of Italian origin, with additions from Gaul and Africa. In the second half of the eleventh century the Roman liturgy began to supersede it; but this change was stubbornly resisted. In the end six old churches in Toledo were allowed to retain the local rite. Cardinal Ximenes made special efforts at the beginning of the sixteenth century to prevent the liturgy from falling into oblivion and founded a chapel expressly for its use. He also caused a number of learned priests to collate the existing manuscripts and published a revised edition, unfortunately incomplete, in 1500-02. At present it is still used in this chapel daily, and at a chapel in Salamanca once or twice a year. The affinities of this liturgy with the Gallican and the Greek make its study important to liturgical scholars. It was reprinted by Lesley (Rome, 1755) and by Lorenzana (ib., 1804), it is in Migne, *Patrologia Latina*, lxxxv, and the Breviary in lxxxvi, and a new edition appeared at Toledo in 1875. Consult J. M. Neale, *Essays in Liturgiology and Church History* (London, 1863), and C. E. Hammond, *Ancient Liturgies* (Oxford, 1879). See LITURGY.

MOZART, Ger. *pron.* mō'tsärt, LEOPOLD (1719-87). A German musician, father of Wolfgang Amadeus Mozart, born at Augsburg. He was sent to study law at Salzburg, but became a chorister and afterward a music teacher, as he played the violin well, and in 1743 was made a member of the Prince-Bishop's orchestra. In 1762 he was appointed court composer. He produced about 12 oratorios, 18 symphonies, 6 trio sonatas, as well as serenades and concertos. Twelve of his piano-forte pieces were published under the title *Der Morgen und der Abend*. His famous violin method, almost the first of its kind, *Versuch einer gründlichen Violinschule* (1756), was often reprinted and translated, but his chief service to the world was the careful and sympathetic training of his son, the great Mozart, whose genius he judiciously fostered.

MOZART, WOLFGANG AMADEUS (1756-91). A famous German composer. He was born at Salzburg, Austria, Jan. 27, 1756. Mozart's love for music first manifested itself when his eldest sister, Nannerl, began to receive musical instructions from her father. When he was only five years old he composed little minuets and was discovered at work on a concerto. At six he had become so proficient as a performer on the piano, and his sister's progress also had been so great, that their father took them on a tour of the leading capitals of Europe, everywhere meeting with notable receptions.

In 1768 the elder Mozart again took his son to Vienna. There this boy of 12 conducted a solemn mass of his own composition, and his operetta *Bastien und Bastienne* was given at a private performance. After a brief sojourn in Salzburg, where Wolfgang was appointed concert master to the Archbishop, his father took him to Italy. In Rome he heard the famous *Miserere* of Allegri, which was so jealously guarded by the authorities that musicians were forbidden to copy it under pain of excommunication. After twice hearing it young Mozart wrote it out by ear. His compositions and his performances made such a profound impression

that the Pope created him Knight of the Golden Spur, and at Bologna he was elected a member of the Philharmonic Society. At Milan he received a commission to compose an opera, the result being *Mitridate re di Ponto*, which was brought out in December, 1770, and had 20 consecutive performances. His knowledge of the Italian style of singing was greatly broadened through this Italian trip, and especially through his acquaintance with the male soprano Farinelli, the greatest singer of his time.

After another brief sojourn in Salzburg he returned in August, 1771, to Milan, where he brought out his serenata *Ascanio in Alba*, in honor of the nuptials of Archduke Ferdinand, a son of Maria Theresa. The death of Archbishop Sigismund at Salzburg was a severe blow to the Mozarts, for his successor, Hieronymus, for whose installation Mozart composed *Il sogno di Scipione* (The Dream of Scipio), showed little appreciation of his genius. Two other Italian stage works, *Lucio Silla* and *La finta giardiniera*, were produced in Milan, and the latter also in Munich, and on the occasion of Archduke Maximilian Francis's visit to Salzburg, in 1775, he brought out *Il re pastore*.

Disgusted with the obstacles which Hieronymus constantly threw in his way, Mozart, accompanied by his mother, again started out on his travels in September, 1777. In Mannheim he met the Weber family, which was destined to play an important part in his life. The head of this family, Fridolin von Weber, was prompter and copyist at the theatre. The eldest daughter, Josepha, afterward Frau Hofer, was the prima donna for whom in later years Mozart wrote the "Queen of the Night" music in *The Magic Flute*. A younger daughter, Aloysia, afterward Frau Lange, was for a time Mozart's pupil, and he promptly fell in love with her. Another daughter, Constanza, later became his wife. A trip to Paris ended tragically in his mother's death. He returned to Salzburg, stopping on his way in Munich, where Aloysia had secured a position and where he learned that she no longer cared for him. In after years, however, this youthful sweetheart did more than any other singer to make his music famous. While in Paris he made a friend of the encyclopædist Grimm.

At Salzburg he composed the music to the tragedy *King Thamos* and began the composition of an operetta, *Zaide*, which was interrupted by an invitation to compose an opera for Munich. *Zaide* was never finished, but the result of the Munich invitation was the opera *Idomeneo*, which opened a new epoch in his life, being his first masterpiece in the grand style. During a visit to Vienna in 1781 Mozart terminated once for all his relations with the boorish Hieronymus, who had grossly insulted him. He took up his residence with the Webers, who were now in Vienna. His father strongly objected to this, and he moved his lodgings. But he had fallen in love with Constanza, and in August, 1782, they were married. Notwithstanding the grinding poverty of their lot, their marriage was a happy one, for their mutual love atoned for the hardships which constantly confronted them. His marriage took place shortly after the production in Vienna of his opera *Belmonte und Constanza, oder Die Entführung aus dem Serail*. The Italian musicians of Vienna, headed by Salieri, used all means in their power to have the production fail, but it was triumph-

antly successful. Gluck attended one of the performances and was enthusiastic in his approval of it. Nevertheless, from this time on Mozart was constantly met by the hostile machinations of the Salieri party, which greatly embittered his career.

The success of the opera led the Emperor to order a new opera buffa of Mozart, who, in connection with its composition, was brought together with Lorenzo da Ponte. The result was *Le nozze di Figaro*. Beaumarchais's work on which the libretto is based had been forbidden in Vienna on the ground of its immorality. Mozart, however, went to work on the score, and when part of it had been composed, Da Ponte found opportunity to have the Emperor hear it, with the result that he ordered its completion and performance. Besides this he gave the composer an order for a musical comedy, *Der Schauspieldirector*, for a garden fête at Schonbrunn. Throughout the preparations for the production of *Figaro* Salieri and his adherents were active in opposition, and the first performance, in May, 1786, came near being a failure. In January, 1787, however, it was received with immense enthusiasm at Prague, where Mozart became a popular idol. The concerts which he gave there were immensely successful, and he was engaged to write another opera. Da Ponte suggested *Don Giovanni* to him and in April placed the libretto of the work in his hands. By September Mozart and his wife and Da Ponte were in Prague, rehearsals were taken in hand, and late in October *Don Giovanni* was produced and was even more successful than *Figaro* had been.

During a tour undertaken in 1789 with Prince Carl Lichnowski, the destination being Berlin, Mozart stopped en route at Leipzig, where he played in the Thomaskirche and was deeply impressed with Bach's motets. In Berlin his success was such that Frederick William II offered him a position as kapellmeister with a salary of 3000 thalers. But a few words of reassurance from the Austrian Emperor, accompanied with an order for a new opera, coupled with his own strong feeling of loyalty, unfortunately induced him to decline the King's offer, the best he had had. The opera was *Così fan tutte*, which was produced in Vienna in January, 1790. After a visit to Frankfort to attend the coronation of the new Emperor, Leopold II, he returned to Vienna. Meanwhile his old acquaintance Schikaneder was managing a theatre in Vienna. The affairs of the house being precarious, he thought to better them by producing an opera by Mozart, and so applied to him in the spring of 1791 to write a "fairy" opera—"a piece that would attract." Schikaneder himself furnished for Mozart the libretto to the *Zauberflöte* (The Magic Flute). The work was interrupted by an order to compose an opera for the coronation of Leopold as King of Bohemia at Prague in 1791. It was *La clemenza di Tito*, written in a few weeks by a man already much overworked. It did not make much impression. *The Magic Flute* was brought out in September, 1791, under the composer's own direction and with distinguished success.

But Mozart's constant struggle with intrigue and pecuniary necessities, and the strain to which he had subjected himself in order to meet these by constant work, had begun to tell upon him, and when, even before he had finished *The Magic Flute*, he received a mysterious commis-

WOLFGANG AMADEUS MOZART

n to compose a requiem, he felt that he was writing his own swan song. It is now known at the commission came from a Count Alsegg, whose intention was to have the work performed as his own and who therefore kept its identity from Mozart. So fixed became Mozart's idea that he must complete his *Requiem* before death overtook him that even when his fee drove out with him, so that he might be in open air, he insisted on taking his portfolio and music paper along. It was on one of these lives that his melancholy led him to express a belief that he had been poisoned at the instigation of his Italian rivals, a suspicion which, as not, however, seem to have been borne out, believing that he would not live long enough to finish the *Requiem* himself, he sketched out the principal features of the uncompleted part, giving them for his pupil Susmayer to fill out the night before his death he gathered some of his favorite singers about him, had the score of the *Requiem* brought to his bed, and the work was sung until the "Lacrimosa" was reached, when Mozart burst into tears and closed the score. His death came at one o'clock in the morning of December 5, and an eyewitness says at his last motion was an endeavor to imitate a kettledrums in the *Requiem*.

Mozart created no new forms, but filled those of his predecessors with his own individual genius; so that, when he died, his works marked,

to that time, the culmination of every form of music, with the exception only of the oratorio and the fugue. Above all, Mozart was a universalist who moved with equal freedom in all the fields of instrumental and vocal music with his inventive and plastic powers were extraordinary, and his mastery of all technical means supreme. But it must not be supposed that he acquired all this without effort. In 1788 Schunemann published Mozart's notebook for the year 1764, which shows that the eight-year-old composer was by no means a finished artist. Mozart arrived at consummate mastery at an earlier age, it is true, than most great masters, yet only through constant and conscientious practice. In quite recent years the searches of musical scholars have thrown new light on the influences that developed the master's individual style. Mozart's mind was one of unusual receptivity. He learned from all his predecessors, but especially from Stamitz, Johann Christian Bach, Franz Xavier Richter, and Johann Schobert (qq.v.). It has been observed that several works listed in Köchel's thematic catalogue are not original compositions of Mozart, but studies on works by the composers just mentioned. Thus, Wyzewa and Saint-Foix established the fact that the first four piano concertos are only studies on sonatas by Schobert (*Zeitschrift der internationalen Musikgesellschaft*, November, 1908). Likewise the symphony listed by Köchel as No. 18 is only a copy in Mozart's handwriting of a work by F. F. Abel (q.v.). Far from detracting from the master's real greatness, the result of these searches proves but the seriousness and scrupulous care with which the young man strove for perfection.

Rubinstein's words, "Eternal sunshine in music, thy name is Mozart," are a happy characterization of the master's style, which is an ideal combination of Italian melodiousness (in the best sense, of course) and German seriousness. This eternal sunshine, however, is one of

the chief reasons why Mozart's music has paled before the more varied and compelling utterance of a Beethoven, Brahms, and Wagner.

Mozart's dramatic works have been completely enumerated in the preceding biographical sketch. The greatest of these, *Le nozze di Figaro*, *Don Giovanni*, *Die Zauberflöte*, have maintained themselves to this day in the operatic repertory. Of the 40 symphonies only 3—those in G minor, E flat, and C (Jupiter)—are still heard. The other orchestral works include 31 divertissements and serenades (see DIVERTIMENTO, SERENADE), besides a considerable number of pieces in various forms (marches, dances, etc.). He also wrote 25 piano concertos, 6 violin concertos, and over 40 arias with orchestra. In the field of chamber music he left 26 string quartets, 7 string quintets, 2 piano quartets, 42 sonatas for piano and violin, and several other works for various combinations of instruments. The piano works comprise 5 sonatas (four-hand), 17 solo sonatas, and numerous smaller pieces. Among the master's Church music the first place belongs to the immortal *Requiem*. Of the masses published under his name 15 are genuine. It may be of special interest to note that of the so-called *Twelfth Mass*, which for a long time was the most popular, only the magnificent fugue, "Cum Sancto Spiritu," was composed by Mozart. His other sacred music consists of litanies, vespers, magnificats, and smaller works, among which the famous *Ave Verum* deserves special mention.

Mozart's complete works were published by Breitkopf and Härtel from 1876 to 1886.

Bibliography. Biographical: Otto Jahn, *W. A. Mozart* (Leipzig, 1856-59; revised and enlarged by H. Deiters, 2 vols., Leipzig, 1905; translated by P. D. Townsend, 3 vols., London, 1883); Camille Bellaigue, *Mozart* (Paris, 1906); Ludwig Nohl, *Mozart's Leben*, revised by P. A. Mozarts* (Leipzig, 1862; revised and corrected by Paul, Graf Waldersee, ib., 1905); Paul Hirsch, *Katalog einer Mozart-Bibliothek* (Vienna, 1906).

MOZDOK, möz-dök'. A town in the Caucasian Province of Terek, Russia, situated on the left bank of the Terek, 58 miles north of Vladikavkaz (Map: Russia, G 6). It has a number of Armenian and Greek churches, of which that of the Assumption attracts many pilgrims. The educational institutions include four Mohammedan schools. Gardening and the manufacturing of wine are the chief occupations. The town

was founded in 1762 Pop., 1897, 14,583; 1911, 17,068, consisting chiefly of Kabardins, Georgians, and other Caucasian tribes, Armenians, and about 4000 Russians.

MOZETTA, mò-tsét'tá. See **COSTUME**, **EC-CLESIASTICAL**.

MOZIER, mò'zhër, JOSEPH (1812-70) An American sculptor. He was born at Burlington, Vt., and in 1831 settled in New York, where he established himself as a merchant. In 1845 he retired from business to devote himself to art and shortly afterward went to Italy. He studied sculpture for several years at Florence and then went to Rome, where he spent the greater part of his professional career. Among his best works are: "Esther"; "Wept of Wishton-Wish"; "Tacite" and "Truth," in the Mercantile Library, New York; "Pocahontas"; "Prodigal Son," in the Philadelphia Academy, "Rebecca," in the New York Public Library; "Il Penseroso," in Horticultural Hall, Fairmount Park, Philadelphia. Though often amateurish and deficient in modeling, these statues are interesting and show more originality and emotional power than the average sculpture of the day in America. "Rizpah," in the Metropolitan Museum, New York, is one of his latest and most mediocre works. He died at Faido, Switzerland.

MOZLEY, mòz'li, JAMES BOWLING (1813-78). An English clergyman. He was born at Gainsborough, Lincolnshire, and was sent in early youth to school at Grantham. In 1830 he was admitted to Oriel College, where he came into intimate association with the leaders of the Oxford movement—Newman, Pusey, Keble, and Hurrell Froude. With this movement he became formally allied, though he was never among the more dogmatic of its promulgators. In 1834 he took his degree, and shortly thereafter won the Chancellor's prize for an English essay on "The Influence of Ancient Oracles on Public and Private Life." He remained at Oxford, studying theology under the direction of Pusey and Newman, as fellow of Magdalen, until 1865, during which period he contributed, first to the *British Critic* and later to the *Christian Remembrancer*, articles suggested by the Church movement of the time. He was in full accord with Anglican teachings until the Gorham controversy of 1850 on the subject of baptism led him to attempt a reconciliation with the Christian tradition about baptism with the teachings of Calvinistic theology. His contributions to this subject were: *A Treatise on the Augustinian Doctrine of Predestination* (1855); *The Primitive Doctrine of Baptismal Regeneration* (1856); *A Review of the Baptismal Controversy* (1862). (See **GORHAM CONTROVERSY**; **GORHAM**, **GEORGE CORNELIUS**) He removed from Oxford on his marriage in 1856, and became rector of Old Shoreham, Sussex. In 1869 Gladstone appointed him canon of Worcester, and two years later nominated him regius professor of divinity at Oxford, which post he held until his death. In addition to the works already mentioned he published his Bampton lectures on *Miracles* (1865) and *Ruling Ideas in Early Ages* (1877). Consult Anne Mozley, *The Letters of J. B. Mozley* (London, 1885), and Paul Thureau-Dangin, in *The English Catholic Revival in the Nineteenth Century* (2 vols. ib., 1914). He was a brother of Thomas Mozley.

MOZLEY, THOMAS (1806-93). An English clergyman and journalist. He was born at

Gainsborough and attended Charterhouse School. In 1825 he entered Oriel College, Oxford. He became fellow of Oriel and enjoyed the intimate friendship of the leaders of the Oxford movement, the personal side of which he has given in his *Reminiscences, Chiefly of Oriel College and the Oxford Movement* (1882). In 1831 he entered the active ministry, but returned to Oriel in 1835 to assume the office of junior treasurer. In 1836 he resigned his fellowship and became rector of Cholderton, Wiltshire, where he remained 11 years, varying his pastoral duties by writing for the *British Critic*. In 1841 he succeeded Newman as editor of that journal. In 1844 he began writing for the *Times* (London), and in 1847 he resigned his living and removed to London, formally entering upon a long literary career. From 1868 to 1880 the rectorship of Plymtree was his. The years 1869-1870 found him in Rome as correspondent for the *Times*. From 1880 to 1893 he resided at Cheltenham, engaged in literary pursuits. James Bowling Mozley was his brother.

MOZOOM'DAR, PRATAP CHANDRA (c.1840-1905) A Hindu reformer and theist. He was born at Calcutta, India, studied in the native college there, was led by conviction to join the Brahmo-Somaj (q.v.), and became the editor of the *Theistic Quarterly Review* and the *Interpreter*, published in Calcutta in the interests of the association. In 1874 he visited England, and in 1883 the United States, where he was welcomed by the leading men of several Christian denominations. During his stay he published a book entitled *The Oriental Christ*, and on his second visit he read a paper before the World's Parliament of Religions on the *Brahmo-Somaj*, published in Chicago, 1893. He is the author of *The Faith and Progress of the Brahmo-Somaj* (1882), *Life and Teachings of Keshub Chunder Sen* (1887), and has contributed also to British and American periodicals. His fame and influence were, however, far greater in England and America than they ever were in India.

MOZYR, mò-zër'. A town in the Government of Minsk, Russia, situated on the right bank of the Pripiet, 204 miles southeast of Minsk (Map. Russia, C 4). It manufactures leather, beer, and hardware, and trades in grain, animals, and lumber. Pop., 1897, 10,762, 1910, 10,729, including about 5000 Jews.

MPONGWE, m'pòn'gwè A Bantu-speaking people living about the Gabon estuary, in French Equatorial Africa. They are often confused with the Pangwe, a distinct group of tribes ranging between lat 1° and 5° N. Formerly powerful, the Mpongwe have been broken up by the movements of other tribes, especially by the Fans. Missionary work has been carried on among the Mpongwe for a long time, and their language, which has been reduced to writing through these efforts, is peculiarly rich, so that it has been adopted by neighboring tribes, and thus forms a trade language. The Mpongwe are above the average height and well developed, their hair is woolly, and the skin of light chocolate color. In character they are boastful and indolent. Agriculture and trading are their chief pursuits. As merchants they are untrustworthy, being known as clever swindlers. The political unit is the clan, ruled over by the headmen. The so-called king is chosen from the headmen by lot in a solemn conclave, and is reviled and mistreated before being proclaimed.

In arts the Mpongwe are at a low level. They

are said to cook their food by boiling it in earthen vessels, apparently not being familiar with the method of roasting. As canoe makers they are skillful, and are admirable boatmen. The canoes, usually 60 feet long, are hollowed out by fire and transported often several miles to water. Around the stations the Mpongwe are nominally Christians, but the isolated natives retain their pagan religion, with its fetish idols, charms, and belief in witchcraft.

MRICCHAKATIKA, mrich'a-kū'tē-ki' (Skt. *mrochakaṭikā*, clay cart). The title of a Sanskrit play of the sixth century attributed to a king named Sūdraka, but probably written for him by the poet Dandin (q.v.). The play, which is in 10 acts, is one of the most exquisite of all the Sanskrit dramas and is noteworthy for its vigor, life, and action. The scene is laid at Ujjain (q.v.), and its central theme is the noble love of the rich courtesan Vasantasenā for a merchant named Charudatta, who has been reduced to poverty. The *Mricchakatikā* has been edited by Stenzler (Bonn, 1847), Codabole (Bombay, 1896), Vidyasagara (2d ed., Calcutta, 1891), and Parab (Bombay, 1900). It has been translated into German by Bohtlingk (St. Petersburg, 1877), Fritze (Chemnitz, 1879), and Kellner (Leipzig, 1894); into Dutch by Vogel (Amsterdam, 1897), into Swedish by H. Andersson (Lund, 1826), into French by Fauche (1861) and Regnaud (1876-77), into Italian by Kerbaker (1908), and into English by Wilson in *Select Specimens of the Theatre of the Hindus* (3d ed., London, 1871) and Ryder (Cambridge, Mass., 1905). Consult Lévi, *Théâtre Indien* (Paris, 1890); Chatterpādhyāya, *Mricchakatikā, or The Toy-Cart of King Sūdraka. A Study* (Mysore, 1902); Gawronski, *Sprachliche Untersuchungen über das Mricchakatikā und das Daśakumāracarita* (Leipzig, 1907); Bartoli, *Il carretto d'argilla* (Bari, 1909). For bibliography, consult Montgomery Schuyler, *Bibliography of the Sanskrit Drama* (New York, 1906).

MUALLAKAT. See MOALLAKAT

MUCHA, mu'sha', ALPHONSE MARIE (1860-). An Austrian decorative painter and illustrator. He was born at Ivancja (Moravia) and studied at the Munich Academy, at Vienna, and in Paris, chiefly under J. P. Laurens, who strongly influenced him. He started in Paris as an illustrator, but first attracted wide attention by his poster of Sarah Bernhardt as "Gismonda." Later he designed posters for her in all her great rôles, achieving special success with his "Medea." All his work in this line is distinguished by originality of design, richness of color, skillful use of mosaic backgrounds, and a wealth of decorative detail. His decorative panels, including a series of the "Four Seasons," and his cartoons for stained-glass windows possess great charm and individuality. He also takes a high rank as an illustrator of such works as Seignobos' *Scènes et épisodes d'Illemagne* and Robert de Flers' *Ilse*. He contributed frequently to *L'Illustration*, *Le Monde Illustré*, and other periodicals, and became a Chevalier of the Legion of Honor. Consult *Alphonse Mucha et son œuvre* (Paris, 1897).

MUCH ADO ABOUT NOTHING. A comedy by Shakespeare, produced in 1597-98 and printed in 1600. It was probably a recast of *Love's Labour's Won* (1590), and was known as *Benedick and Beatrice* (1613). The story of Hero and Claudio is taken probably from the tale of

"Ariodante and Ginevra" in Ariosto's *Orlando furioso*, which was translated by Beverly and dramatized as *Ariodante and Ginevra* (1582). It is found also in Bandello's novels and in a German play by Jacob Ayrcr, *The Beautiful Phœnician* (1596). This contains some features not in the novel but used by Shakespeare, pointing to some unknown intermediate source. Otherwise the comedy is quite original, especially the inimitable Dogberry.

MUCILAGE (Lat. *mucilago*, moldy, musty juice, from *mucere*, to be moldy, from *mucus*, slime). A name applied to aqueous solutions or jelly-like preparations of vegetable gums or of dextrin (q.v.). Distinction was made formerly between solids exuding from plants, such as gum arabic or gum tragacanth, and solutions made by extracting plants, as quince, marsh-mallow, etc. The United States Pharmacopœia contains four mucilages, including *Mucilago acacia* and *Mucilago tragacanthæ*. See CEMENT.

MUCIN. See MUCOUS MEMBRANE.

MUCIUS SCÆVOLA, mī'shū-ūs sēv'ō-la. See PORSENA.

MUCK, muk, KARL (1859-) A German opera and concert conductor, born at Darmstadt. He was intended for a professional career and studied at Heidelberg and Leipzig. While at Leipzig he also attended the Conservatory. After a successful début as pianist at the Gewandhaus (1880), he turned his attention entirely to music, becoming conductor at Salzburg. After some minor engagements he attracted attention through his work at the opera at Prague (1886-92). In 1892 he became one of the conductors of the Berlin Royal Opera, alternating with Richard Strauss. At the same time he frequently directed at Bayreuth, and was in great demand as guest conductor in all the principal cities of Europe, both in opera and concert. From 1906 to 1908 he was conductor of the Boston Symphony Orchestra. Although the management would gladly have retained him longer, he was obliged to return to Berlin, as the Emperor refused to extend his leave of absence. In 1912 he obtained a definite release from his duties at the Royal Opera and assumed the regular conductorship of the Boston orchestra.

MUCKERS (Ger. *Mucker*, sulky person, hypocrite). The popular but opprobrious name, meaning that they were hypocrites, of an extraordinary sect which sprang up at Königsberg in Germany in 1835. The movement seems to have originated in the dualistic and Gnostic views of John Henry Schonherr (1770-1826) concerning the origin of the universe by the combination of a spiritual and a sensual principle. His followers carried out his system much more completely than himself. The most notable of them were two clergymen, Johann Wilhelm Ebel and Georg Heinrich Diestel, the former an archdeacon, who founded a society to which women—some of noble birth—attached themselves. Scandal was thereby caused, and Ebel's easily misunderstood expressions as to the proper relations of the sexes were made the basis of charges against his chastity and moral influence. His followers were accused of the grossest immorality, and a garden in Königsberg where they met acquired the name of the Seraph's Grove. The subject was brought before the courts (1839-42), and the result was that Ebel and Diestel were degraded from their offices, and the latter was further punished by

imprisonment But the sentence was dictated by strong prejudice against the accused, on account of their religious views and peculiar eccentricities, and the evidence gives no support whatever to the charge of licentiousness. The matter was revamped without proper examination by W. Hepworth Dixon in his *Spiritual Wives* (London, 1868), and thus rendered familiar to English readers For the facts consult J. I. Mombert, *Faith Victorious*, a life of Ebel (New York, 1882). See AGAPEMONE

MUCKLESHOOT. See SALISHIAN STOCK.

MU'CORACEÆ (Neo-Lat. nom. pl., from Lat. *mucor*, mold, from *mucere*, to be moldy, from *mucus*, slime; connected with Gk. *μῦξα*, *myxa*, mucus, Skt *muc*, to release). A family of the Mucorales (q.v.), which is an order belonging to the Zygomycetes (q.v.), one of the two groups of Phycomyetes (q.v.). The Mucoraceæ include the best-known black molds, and are among the most common of the saprophytic fungi The characteristic cobwebby, fleecy-white mycelium, composed of large, often glistening, profusely branched filaments (hyphæ), is very common on decaying material, stale bread (kept moist, and warm), fruits and fruit juices, etc The ordinary form on stable manure is *Mucor mucedo*, while the common bread mold is *Rhizopus nigricans*. The cobweb-like mycelium produces erect branches (sporophores) which terminate in globular sporangia (spore cases), the spores and stalk being dark or even black, suggesting the name black mold. Sexual reproduction occurs under special conditions, when suitable individuals are brought together, for it has been found that the mycelia are sexually differentiated, although the two sexes cannot be distinguished. Fertile branches are developed by the pairing individuals, come into contact tip to tip, and a terminal cell is cut off by each. These two abutting cells fuse, and a zygote (fertilized egg) is the result. *Pilobolus*, the squirting fungus, is also a member of this family, occurring on stable manure and resembling *Mucor*, but remarkable for its method of discharging spores. The sporophore becomes much swollen just beneath the sporangium, and finally bursts, hurling the sporangium with considerable force

MUCORALES, mā'kō-rā'lez. One of the two orders of Zygomycetes (q.v.), which in turn is one of the two groups of Phycomyetes (q.v.) The plants of this order are commonly known as black molds, among which are many of the most common saprophytic fungi. Among the families of Mucorales are the Mucoraceæ (q.v.), the best-known black molds The other order of Zygomycetes is the Entomophthorales (q.v.), a group of parasites fatal to insects.

MU'COUS MEMBRANE and **MU'CUS**. The mucous membrane is continuous with the skin at all the orifices of the body and lines the passages by which the internal organs communicate with the outer world. For convenience of description the mucous membrane may be divided into three great tracts—the alimentary, the respiratory, and the genitourinary.

The *alimentary mucous membrane* commences at the lips and not only forms the inner lining of the intestinal canal from the mouth to the anus, but gives off prolongations which after lining the ducts of the various glands (the salivary glands, the liver, and the pancreas) whose products are discharged into this canal, penetrate into the innermost recesses of these

glands and constitute their true secreting element. Besides these larger offsets we find in the stomach and small intestine an infinite series of minute tubular prolongations, the anatomical arrangement and function of which are described under DIGESTION, ORGANS OF.

The *respiratory mucous membrane* begins at the nostrils and under the name of *Schneiderian* or *pituitary membrane* (see NOSE) lines the nasal cavities, from whence it sends on either side an upward prolongation through the lachrymal duct to form the *conjunctiva* of the eye; backward, through the posterior nares (the communication between the nose and the throat), it sends a prolongation through the Eustachian tube to the middle ear (the cavity of the tympanum), and is continuous with the pharyngeal mucous membrane (which is a portion of the alimentary tract); it then, instead of passing down the œsophagus, enters and forms a lining to the larynx, trachea, and bronchial tubes to their terminations.

The *genitourinary mucous membrane* commences at the genitourinary orifices, lines the excretory passages from the generative and urinary organs, and is the essential constituent of the glands of both In the female it becomes continuous with the serous membrane of the abdomen at the fimbriæ of the Fallopian tubes. See KIDNEY.

Mucous membranes line all those passages by which internal parts communicate with the surface and by which matters are either admitted into or eliminated from the body. As a general rule they are soft and velvety, and of a more or less red color, from their great vascularity, but they present certain structural peculiarities according to the functions which they are required to discharge In all the principal parts of the mucous tracts we find the mucous membrane presents an external layer of epithelium (q.v.) resting on a thin, transparent, homogeneous membrane, which from its position is termed the basement membrane, and beneath this a stratum of vascular tissue of variable thickness, which usually presents either outgrowths in the form of papillæ and villi, or depressions or inversions in the form of follicles or glands, or both The follicles are almost invariably present, but the papillæ and villi are limited to the alimentary or gastrointestinal mucous membrane The mucous membranes constitute the medium through which are effected nearly all the material changes that take place between the living organism and the external world. Thus, in the gastrointestinal mucous membrane we find a provision for reducing the food by means of a solvent fluid poured out from its follicles; while the villi, which are closely set upon the surface of the small intestine, are specially adapted to absorb the nutrient materials thus reduced to the liquid state The same membrane, at its lower part, constitutes an outlet through which are cast out not merely the indigestible residuum of the food, but also the excretions from numerous minute glands in the intestinal wall. Again, the respiratory mucous membrane serves for the introduction of oxygen from the air and for the exhalation of water and carbonic acid. And, lastly, the mucous membranes are continuous with the cell-lined vesicles or tubes of the various glands, which are the instruments whereby their respective products are separated from the blood.

Mucus. Although the various kinds of epi-

thelial cells discharge a special office in relation to the peculiar function of the mucous membrane upon which each kind occurs, yet they all serve one general purpose—viz., that of protecting the surfaces on which they are placed. This protecting power is increased by the presence of the secretion known as *mucus*, which ordinarily forms an extremely thin layer on these membranes, but when they are irritated or inflamed is secreted in very considerable quantity (See CATARRH). The exact mode of its formation is still a disputed question, but it is generally believed to be the product of the gradual solution of the uppermost epithelial cells. Besides acting both mechanically and chemically as a shield to highly sensitive membranes, mucus has other uses, among which two may be especially mentioned: (1) it communicates to the salivary, and probably to other, glands properties which are not possessed either by itself or by the pure glandular secretions, and (2) it serves to eliminate a considerable quantity of nitrogen from the system.

Mucin. This nitrogen is contained in the *mucin*, which forms from 24 to 9 per cent of nasal and bronchial mucus. This mucin contains 12.64 per cent of nitrogen, and is the substance which gives to mucus its viscid and tenacious character. Normal mucus is devoid of smell and taste and is faintly alkaline in reaction.

MUCUNA. A genus of leguminous plants. See COWAGE; LUMBRICOID.

MUCUS. See MUCOUS MEMBRANE.

MU'DAR (Hind. *madār*, from Skt. *mandāra*, coral tree), *Calotropis*. A genus of East Indian shrubs of the family Aselepiadaceæ. The bark of the root and the thick milky juice of some species are used in the East, where they have long been credited with alterative, purgative, emetic, and sudorific properties which have attracted some attention from European physicians. Mudar is a very common and often troublesome weed in India. The commonest species, *Calotropis gigantea*, a large shrub, with stems often thicker than a man's leg, and broad, fleshy leaves, rapidly attains a large size on very dry sands, where almost nothing else will grow. The short, not easily spun, silky down of the pods is used for making floss and a soft, cotton-like thread. A strong fibre, useful for cordage and fishing lines, is obtained from the inner bark. When properly prepared it is especially well adapted to mix with various other fibres, especially silk. The thick, milky juice, collected by making incisions in the bark, is used as a substitute for caoutchouc and gutta-percha. It becomes flexible when heated. *Calotropis procera* occurs as a low tree in the Sahara. Its fruit is said by some to be the apple of Sodom of the Bible. See SODOM, APPLE OF.

MUD CAT. See CATFISH.

MUD DAUBER. See MUD WASP.

MUD EEL. A siren. See MUD PUPPY.

MUDFISH. A name given to several widely different fishes which frequent muddy waters. 1. In the United States, the bowfin (q.v.). 2. In California, a small marine goby (*Gillichthys mirabilis*) which lives in shallow places that are left bare at low tide and harbors in excavations made by itself in the mud. 3. One of the killifishes (see KILLIFISH), the mummichog, or mud dabbler. 4. Any of the lungfishes or dipnoans, especially the rare *Lepidosiren paradoxa*

of Brazilian swamps. (See DIPNOI, and Plate of DIPNOI AND CHIMÆRA.) This is a salamander-like creature which grows to a length of 4 feet or more, has the dorsal, caudal, and anal fins united into one continuous fin and the pectoral and ventral fins produced into long jointed filaments. The head is conical, eye small, gill openings without covers, mouth small, and teeth pointed and cusped, adapted to crushing the fresh-water snails (chiefly *Ampullaria*) upon which it feeds. A closely related west African fish (*Protopterus annectans*), sometimes 6 feet long, is very abundant in the Gambia River, where it sustains a torpid existence during the dry season by burying itself in the mud, forming a sort of nest or case of hardened mud about it. Many specimens have been dug out and sent, each within its clod, to Europe, and kept alive in zoölogical gardens. They grow rapidly, are active and voracious the year round, when kept in tanks in hothouses feed upon flesh and all sorts of small animals, and frequently eat each other. In the wet season they swim and crawl about the muddy rivers they inhabit, and are sought as food by the natives. They are nocturnal and frequently rise to the surface to breathe. Their breeding habits are little known, but they are believed to be ovoviviparous. The young have external gills. Consult Richard Lydekker, *Royal Natural History*, vol. v (London, 1895).

MUDFORD, WILLIAM (1782–1848). An English writer, who as editor of the London *Courier*, for a time the rival of the *Times*, exerted great influence on public opinion. Leaving the *Courier*—which declined in influence after his withdrawal and presently was discontinued—he became editor and proprietor of the *Kentish Observer*, the organ of the Conservative party in Kent. In 1841 he succeeded Theodore Hook as editor of *John Bull*. To *Blackwood's Magazine* he contributed many essays and tales, afterward collected in part. Among his published volumes are *A Critical Enquiry into the Writings of Dr Samuel Johnson* (1803), *Nubia in Search of a Husband* (1809), *The Contemplantist* (1811), essays, *An Historical Account of the Campaign in the Netherlands in 1815* (1817), *Tales and Trifles from Blackwood's* (1849).

MUDGE, ENOCH (1776–1850). The first Methodist minister reared in New England. He was born at Lynn, Mass., was converted under Jesse Lee, the pioneer of Methodism in New England, and entered the ministry in 1793. He labored as an itinerant preacher in Maine until 1799, when his health gave way and he was forced to retire. He was twice chosen State Representative and had much to do with the passage of the Religious Freedom Bill. In 1816 he resumed preaching. From 1832 to 1844 he was pastor of the Seaman's Chapel at New Bedford, Mass.

MUDGE, JAMES (1844–). An American Methodist Episcopal clergyman and writer, nephew of Zachariah Mudge. He was born at West Springfield, Mass., and graduated from Wesleyan University in 1865 and from Boston University School of Theology in 1868. The same year he entered the ministry, joining the New England conference. While a missionary in India from 1873 to 1883 he edited the *Lucknow Witness*. After his return he was pastor of churches in Massachusetts until 1908, serving also as lecturer on missions at the Boston

University School of Theology. In 1889 he became secretary of the New England conference. He wrote: *Memorial of Rev Z. A. Mudge; Historical Sketch of the Missions of the Methodist Episcopal Church* (1877); *A Defense of Christian Perfection* (1896); *The Best of Browning* (1898); *The Life Ecstatic* (1906); *Fénelon the Mystic* (1906); *The Riches of His Grace* (1909); *History of the New England Conference* (1910); *The Perfect Life in Experience and Doctrine* (1911); *Hymns of Trust* (1912); *Religious Experience Exemplified in the Lives of Illustrious Christians* (1913). For many years he was book editor of *Zion's Herald*.

MUDGE, THOMAS HICKS (1815-62). An American Methodist Episcopal clergyman, born at Orrington, Me., the son of Enoch Mudge. He graduated from Wesleyan University in 1840 and from Union Theological Seminary in 1843, and then entered the ministry, joining the New England conference. After several pastorates in New England he became professor of sacred literature in McKendree College, Lebanon, Ill., serving from 1857 to 1859. Later he held pastorates in St. Louis, Mo., and Baldwin, Kans.

MUDGE, ZACHARIAH ATWELL (1813-88). An American Methodist Episcopal clergyman and author, nephew of Enoch Mudge. He was born at Orrington, Me., and was educated at Wesleyan University. He entered the ministry in 1840 and held various pastorates in Massachusetts. For three years he was editor of the *Guide to Holiness*. He was the author of *Memor of Cyrus Shepherd* (1848); *Views from Plymouth Rock* (1861); *The Christian Statesman: A Portraiture of Sir Thomas Fowell Buxton* (1865); *The Forest Boy: The Sketch of the Life of A. Lincoln* (1867); *Footprints of Roger Williams* (1871); *Arctic Heroes* (1875); *North Pole Voyages* (1875); *An Easy Lesson Book for Infant Scholars*, the sale of which reached into the hundred thousands. It was translated into the Urdu language by James Mudge, who also wrote a *Memorial* of his uncle.

MUD HEN. A variant of marsh hen, some species of coot, gallinule, or rail (qqv).

MUDIE, mūdī, CHARLES EDWARD (1818-90). The founder of the famous Mudie's Lending Library, London, and a publisher. He was born at Chelsea and established himself in 1840 in London as a stationer and bookseller. In 1842 he commenced his lending library and, by a shrewd understanding of the needs and tastes of his public and by extensive advertising, fostered its growth and established several branches. In 1864 Mudie's became a limited company. Among the books he published may be noted the first English edition of James Russell Lowell's poems. A volume of Mudie's own verse appeared in 1872.

MUD MINNOW. A small, minnow-like fish of the family Umbridae, closely allied structurally to the pikes. They inhabit weedy streams, bogs, and ditches in the United States, and also in Austria, where they bury themselves in the mud. They are carnivorous, and extremely tenacious of life. Often when none can be seen in a pool a swarm of these little dark-green fishes may be aroused by raking through the mud. Two American species are known, the Eastern mud minnow (*Umbra pygmaea*) and the Western dogfish (*Umbra limi*).

MUD PUPPY, or WATER DOG. An American salamander of the family Proteidae, characterized by having four toes on each foot and persistent larval gills. This genus was formerly

called *Menobranchus*. Two species inhabit the central parts of the United States, of which the more common and widespread is *Necturus maculatus*. It reaches the length of 1 foot, is smooth, slimy, and brown-blotched, with the

A MUD PUPPY

tufted gills dark red. These creatures remain mostly among weeds or rocks at the bottom of the water during the daytime, but at night they move about, often with quick eel-like motions (a local name is mud eel), in search of crayfish, worms, insects, frogs, etc. They spawn in April or May. Other salamanders are sometimes given the same name, especially the axolotl (qv).

MUD SHAD. A useless shadlike fish (*Dorosoma cepedianum*), called also "gizzard" and "hickory" shad, which is abundant all along the coast from Cape Cod to Mexico and also throughout the Mississippi valley. It grows to a length of about 15 inches and is bluish silvery, the young having a round dark spot at the shoulder. See Plate of HERRING AND SHAD.

MUDSKIPPER. One of the curious little fishes (3-4 inches long) of the goby family and genus *Periophthalmus*. They are sometimes called pumping fishes or leaping fishes and abound on the coasts of west Africa, the Red Sea, Indian Ocean, and eastward to Japan. Their remarkable peculiarity is that they will leave the water to visit every place washed by the surf. By the aid of the pectoral and ventral fins and the gill covers these fishes skip across the damp sand, ascend the roots of mangroves, and run up wet rocks in quest of flies. They are, says Day, essentially mud-dwelling fishes, dark brown in color, and if placed in a vessel of

A MUDSKIPPER

deep clear water will drown. This amphibious power of these fishes has been acquired without any essential change in the character of the gills, but the fish is in the habit when out of water of puffing out its cheeks with air, which is held for a short time and then renewed. Consult Day, *Fishes of India* (London, 1878), and Karl Semper, *Animal Life as Affected by Natural Conditions of Existence* (New York, 1881).

MUD SUNFISH. A small bass (*Acantharchus pomotis*) of little value as food, numerous in sluggish coastal streams from New York to South Carolina. It is dark green in color, with five indistinct blackish stripes lengthwise and a black opercular spot.

MUD TORTOISE, or **MUD TURTLE**. A dark-brown turtle (*Cinosternum pennsylvanicum*) with light dots on the head, found from Canada to Texas. See **TERRAPIN**.

MUD WASP, or **MUD DAUBER**. Any one of a group of wasps belonging to the old genus *Pelopaeus*, now *Sceliphron*. They build nests of mud in sheltered places, choosing the cracks of a barn or fence or some sheltered place under the eaves of any wooden building, entering also disused rooms in houses, and sometimes even rooms that are in daily use. The nests consist of a varying number of mud cells placed side by side, usually in a single row, but sometimes in several rows. The cells before completion are packed with a food supply for the future young, and this consists almost invariably of spiders, as many spiders being placed in one cell as the cell will hold. A single egg is laid upon the last spider which has been placed in the cell, and the larva hatching from the egg eats rapidly, consuming the abdomens of the spiders first and subsequently the remainder of their bodies. All of the spiders which have been placed in the cell have been stung and paralyzed by the parent wasp, but many of them are not really dead when the larva reaches them. After the egg is laid and the nest is closed up, new cells are constructed by the same female. The mud or clay with which the nests are constructed is brought in little balls by the aid of the wasp's mandibles, and 20 or more visits are required to complete one cell, so that for the construction of a large nest of 50 cells about 1000 visits must be made by the insect. The larva reaches full growth in a short time, usually 10 days or two weeks, and forms a cocoon within the mud cell, the winter being passed in the cocoon, although there may be two or more summer generations, in which case the summer pupal period is short. The group is a large one, and mud wasps are common not only in America and in Europe, but in India and Australia. Consult J. H. Fabre, *Insect Life* (London, 1901), David Sharp, in *Cambridge Natural History*, vol. vi (ib., 1901), L. O. Howard, *The Insect Book* (New York, 1914). See also the article **WASP** and its bibliography.

MUET, mu'â', **PIERRE LE** (1591-1669). A French architect, born at Dijon. He is chiefly noted for his work on the beautiful church of the Val-de-Grâce in Paris, whose construction he superintended from 1655 to 1666 as successor to Jacques Lemercier (q.v.). He published in 1623 *Manière de bien bâtir pour toutes sortes de personnes*.

MUETTE DE PORTICI, mu'ët' de pôrt'é-chê, **LA** (Fr., The Dumb Girl of Portici). An opera by Auber (q.v.), first produced at Paris, Feb. 29, 1828; in the United States, Nov. 28, 1831 (New York).

MUEZZIN, mû-êz'in, or **MUED'DIN** (Ar. mu'adhdhin, one who calls to prayer, from 'adhdhana, to call to prayer, from 'adhma, to hear). The Arabic name of the Mohammedan official attached to a mosque, whose duty it is to announce the different times of prayer. His chant ('adhân) consists of these words, repeated at intervals: "Allah is great [four times]. I testify that there is no God but Allah [two times]. I testify that Mohammed is the apostle of Allah [two times]. Come to prayers [two times]. Come to salvation [two times]. There is no god but Allah." The Shiites also say "Come to good works," and "Prayers are better

than sleep" is added before the early morning prayer (*fajr*). Besides these regular calls, two more are chanted during the night for those pious persons who wish to perform special nightly devotions. In small mosques the 'adhân is chanted by the imam, and, when the mosque is provided with a minaret, the muezzin ascends it for his chant; in smaller mosques, the chant is made at the side. The office of muezzin is considered a meritorious one, and insures the holder's admission into Paradise.

MUFTI, mûftî (Ar. mufti, expounder of the law). The name of a Mohammedan official who expounds the law according to the Koran and traditions, according to his decision, delivered in a memorandum called a fetwa, the cadi, or judge, decides the case. In Turkey the grand mufti, or *Sheikh al Islam*, is appointed by the Sultan. He is the supreme chief of the ulemas, or body of Mohammedan theologians. His fetwa is extremely powerful—even under certain circumstances may depose the Sultan. It is through him that the jihad, or holy war, is proclaimed, as was done by the fetwa published in the *Tanin*, Nov. 15, 1914. The title mufti is also applied to jurisconsults attached to local government councils in the Turkish Empire, but the power of the muftis, with the exception of the grand mufti, is largely nominal.

MÜGELN, HENRICH VON. See **HEINRICH VON MUGELN**.

MÜGGE, mug'ge, **THEODOR** (1806-61). A German novelist, born and educated in Berlin. His liberal sentiments, expressed in various newspapers and in such pamphlets as *Die Censurverhältnisse in Preussen* (1845), led in several instances to his arrest and prosecution. During the 20 years preceding his death he wrote numerous sketches, tales, novels, and romances. Several, including *Toussaint* (1840) and *Afraya* (1854), have been translated into English by E. J. Morris. Among the most interesting of his writings are his Norwegian romances and sketches of travel. *Leben und Lieben in Norwegen* (1858), *Skizzen aus dem Norden* (1844), *Nordisches Bilderbuch* (1858, 3d ed., 1862). A complete edition of his novels was published in 33 volumes (Breslau, 1862-67). Consult the *Allgemeine deutsche Biographie*, vol. xxii (Leipzig, 1885).

MUGGER. The common marsh crocodile of India and the Malay islands (*Crocodilus palustris*). It is not often more than 12 feet in length. Its head is rough, with a thick and rather broad snout, and each jaw contains 19 teeth on each side. It inhabits rivers, ponds, tanks, and marshes, and goes ashore only when it is obliged to move into some new water by the drying up of its pond, or wishes to bury its eggs in the sand. In extreme drought, however, it buries itself in the mud and remains dormant until the coming of the rains. This is the crocodile which is venerated by the Hindus and is kept in a half-domesticated condition in certain ponds, attended by fakirs, who worship in a neighboring temple of their cult. Consult the writings of Indian naturalists, especially Sir J. E. Tennent, *Sketches of the Natural History of Ceylon* (London, 1861), A. L. Adams, *Wanderings of a Naturalist in India* (Edinburgh, 1867); W. T. Hornaday, *Two Years in the Jungle* (7th ed., New York, 1901).

MUGGLETONIANS. A sect that arose in London about the year 1651. The founders were

two cousins, John Reeve (1608-58) and Lodowicke Muggleton (1609-98), obscure journey-men tailors, claiming to have the spirit of prophecy. Muggleton professed to be the "mouth" of Reeve, as Aaron was of Moses. They affirmed themselves to be the two witnesses of Revelation xi. They asserted a right to curse all who opposed them, and did not hesitate to declare eternal damnation against their adversaries. They denied the doctrine of the Trinity; held anthropomorphist opinions about the Deity; and to all this added many strange doctrines of their own, as that the devil became incarnate in Eve, etc. *The Complete Works of Reeve and Muggleton* were published in London (1756; reprinted, 1832). The sect lasted until the middle of the eighteenth century. Consult Gordon, "The Origin of the Muggletonians" and "Ancient and Modern Muggletonians," in the *Transactions of the Liverpool Literary and Philosophical Society* for 1869-70.

MUGNONE, mŭō-nyō'nā, LEOPOLDO (1858-). An Italian orchestral conductor, born at Naples. He received his musical education at the Conservatory of his native city, and began the usual career of an Italian operatic conductor. When he became acquainted with Wagner's works, he saw that he had found a task worthy of his unusual gifts. From that time on he was, together with Mariani (q.v.), the most active apostle of the new style, which everywhere met with opposition. His excellent work at the Costanzi Theatre in Rome made him famous, and attracted the attention of Verdi, who, in 1892, chose him to direct the first performance of *Falstaff*. Together with Mariani, Mugnone is to be regarded as the founder of interpretative conducting in Italy. As a composer he is unimportant. His work in this field comprises three operas *Don Bizarro e le sue figlie* (1875), *Il Brichino* (1892), *Vita Bretonna* (1905).

MUGWORT. A popular name for various species of *Artemisia* (q.v.).

MUGWUMP (Algonquin *mugquomp*, chief, great man). In American politics, a term originally applied to a voter nominally identified with a particular party, but claiming the right to vote with another party. It early passed into the local phraseology of some of the New England villages, being applied in its original (Indian) signification to any local magnate. Its first appearance in print seems to have been in the *Indianapolis Sentinel* in 1872. Its popular use began with an article in the *New York Sun* for March 23, 1884. In September of the same year it was first given to a political party, the Independent Republicans, who refused to ratify the nomination of James G. Blaine for the presidency. The name was applied to them in a spirit of derision, but was accepted by them, and now regularly denotes any body of voters who profess to be independent of strict party obligations. The name Dudes and Pharisees was also applied in 1884 to those Republicans who opposed the election of James G. Blaine. As since adopted in England, it usually means one who stays neutral and votes for no party.

MUHARRAM (Ar. *muharram*, sacred, from *harama*, to forbid). The first month of the Mohammedan year. Originally the Arabs had a solar year by means of intercalary months. The first month was called *Safar I* and came in the autumn. It was the month of fairs, pilgrimages, and festivals, and hence acquired the

epithet *al Muharram*, the sacred, which in time supplanted the real designation. When in the year 10 of the Hejira Mohammed restored the lunar year, on the ground that intercalary months were an impious interference with the order of things as established by God, Muharram and all the months began to come earlier in each succeeding year. Mohammed is said to have observed the tenth day of Muharram (the *'ashū'ā*) as a fast day, perhaps in imitation of the Jewish Day of Atonement on the tenth of Tishri. Later he appointed the month of Ramadan (q.v.) for fasting. The Sunnites still consider the tenth of Muharram as sacred, and keep it as a fast. The Shiites lament the death of Husain on the first 10 days of the month. See HASAN AND HUSAIN. Consult Julius Wellhausen, *Rechte arabischen Heidenthums* (2d ed., Berlin, 1897).

MÜHLAU, mu'lou, FERDINAND (1839-1914). A German biblical scholar. He was born in Dresden, was educated at Leipzig and Erlangen, and in 1869 became docent at the latter university. From 1870 to 1895 he was professor of exegesis at Dorpat and then, until his retirement in 1909, of New Testament exegesis at Kiel. Among his published works are *Geschichte der hebräischen Synonymik* (1861), *De Proverbiorum quæ dicuntur Aguri et Lemuelis Origine et Indole* (1869), *Besitzen wir den ursprüngliche Texte der heiligen Schrift?* (1884); a text of Genesis without points, with Kautzsch (4th ed., 1904); a revision of Gesenius' lexicon, with Volek (1886, 1890); *Zur paulinischen Ethik* (1898).

MÜHLBACH, mu'l'bag, LUISE. The assumed name of Klara Mundt (1814-73), wife of Theodore Mundt, an author of the Jungdeutschland school. A German author, born in Neubrandenburg. Her very numerous works, consisting mostly of historical novels, are sensational, inartistic, distorted, but show a talent for lively description and narration that gave her a wide but short-lived popularity. *Friedrich der Grosse und sein Hof* and many others of her novels have been translated into English.

MÜHLBERG, mu'l'bērk. A town in the Province of Saxony, Prussia, on the Elbe, 35 miles northwest of Dresden (Map: Prussia, E 3). It manufactures sugar, bricks, and lumber. It is famous as the scene of a battle in 1547, which resulted in the defeat of the Protestants under John Frederick I, Elector of Saxony, by the Emperor Charles V, and the triumph of the Catholics in Germany. Pop., 1900, 3463; 1910, 3345.

MÜHLEISEN-ARNOLD, mu'l'i-zen-ār'nold, JOHN (1817-81). An English clergyman, missionary, and author, born at Zell (Württemberg). He was educated in Germany and after his removal to England was successively missionary of the Church Missionary Society in India and Abyssinia, chaplain to the Bishop of Gibraltar, and chaplain to St. Mary's Hospital, Paddington, London (1852-61). In 1859 he founded the Moslem Mission Society in England. He was chaplain of East Ham, Essex, from 1861 to 1865, consular chaplain at Batavia, Java, from 1865 to 1871, and rector of St. Mary's Church, Papendorf, Cape Town, South Africa, from 1876 until his death. His publications include: *Ishmael; or, A Natural History of Islamism* (1859); *English Biblical Criticism, and the Authorship of the Pentateuch, from a German*

Point of View (2d ed., 1864); *Genesis and Science*; or, *The First Leaves of the Bible* (2d ed., 1875).

MUHLENBERG, mü'len-bêrg, FREDERICK AUGUSTUS CONRAD (1750-1801). An American clergyman and politician, son of Heinrich Melchior Muhlenberg. He was born at New Providence (now Trappe), Montgomery Co., Pa., studied in Germany at the University of Halle, and upon his return to America entered the Lutheran ministry in Pennsylvania. In 1773-76 he was pastor of a Lutheran church in New York City. He was an ardent patriot, and in 1776 he quitted New York and returned to his native State, at the same time abandoning the work of the church for political activity. He was elected to the Continental Congress in 1779. He was also a prominent member of the Pennsylvania Legislature and was twice Speaker of that body. The first session of the House of Representatives in Washington's administration chose him as Speaker, an office which he twice filled. He was also made chairman of the Committee of the Whole in 1795, and cast the deciding vote that saved the Jay Treaty (q.v.).

MUHLENBERG, GOTTHILF HEINRICH ERNST (1753-1815). An American clergyman and botanist, son of Heinrich Melchior Muhlenberg, born at Trappe, Pa. He was educated at Halle and traveled in Germany and in England. He was ordained a Lutheran minister and became assistant pastor of a Lutheran church in Philadelphia. In 1779 he retired to the country, where he devoted himself to the study of botany, and it is as a botanist that he is best known. A well-known genus of grasses (*Muhlenbergia*) was named in his honor. His chief works are *Catalogus Plantarum Americae Septentrionalis* (1813) and *Descriptio Uterior Graminum et Plantarum Calamitarum Americae Septentrionalis Indigenarum et Cicerum* (1817).

MUHLENBERG, HEINRICH MELCHIOR (1711-87). The founder of American Lutheranism. He was born at Embeck, Prussia, Sept. 6, 1711. His parents were Saxon, but, having suffered greatly in the 'Thirty Years' War, removed to Embeck. The death of his father in his twelfth year threw the family into poverty and occasioned an interruption of his studies, and till his twenty-first year he toiled incessantly to assist in the support of the family. In 1735 he entered the University of Gottingen, where he remained three years. Graduating at Gottingen, he went to Halle in 1738, where, besides studying, he taught in the orphan house. He associated intimately with Francke, Cellarius, and Fabricius. Soon after his ordination application came to Germany from Pennsylvania for some one to be sent to labor among the destitute Lutherans of that colony. The faculty selected Muhlenberg, who was then in his thirty-first year. He accepted the appointment, and the better to qualify himself went to London, where he acquired facility in the use of English. He reached America in 1742, to the great joy of the German Christians. His arrival marked a new era in the history of the Lutheran church in the United States. He took the pastoral care of the associated churches of Philadelphia, New Hanover, and New Providence (now Trappe, some 25 miles northwest of Philadelphia), which had united in calling a minister, and these three congregations were the principal scenes of his ministerial labors. At his request

more ministers came from Halle, and his oversight of the Lutheran churches extended from Georgia to New York. The first three years of his ministry he resided in Philadelphia, the next 16 in New Providence. In 1761 he removed to Philadelphia, but in 1776 went back to New Providence. During the War of the Revolution his sympathy with the colonists excited great opposition, and his life was often in peril. Consult his autobiography to 1743 (in German), edited by W. Germann (Altoona, 1881), and his *Life* by M. L. Stoeber (Philadelphia, 1856), W. J. Mann (ib., 1887), and W. K. Frick (ib., 1902); also Ochsensford, *Muhlenberg College, a Quarter-Centennial Memorial Volume* (Allentown, 1892).

MUHLENBERG, JOHN PETER GABRIEL (1746-1807). A Lutheran preacher and leader in the Revolutionary War, son of Heinrich Melchior Muhlenberg (q.v.). He was born at Trappe, Pa., Oct. 1, 1746, was sent to the University of Halle to be educated, but entered the army, and passed a year as a private in the dragoons. Returning to America, 1766, he studied for the Lutheran ministry, was called to Virginia, 1771, to have a legal standing as a clergyman there, went to England, 1772, and was ordained by the Bishop of London. In the same year he was settled at Woodstock, Va. Soon after the beginning of the Revolutionary War he told his congregation that there was a time to preach and a time to fight, and at the close of the services he threw off his gown, showing himself in full uniform, and read from the pulpit his commission as colonel. He had the drummers strike up for volunteers, and nearly 300 of his congregation volunteered and joined his regiment, the Eighth Virginia, popularly known as the German regiment, afterward noted for its courage and good discipline. In 1774 he was a member of the House of Burgesses and served on the committee of safety, and two years later he sat in the State convention. He participated in the fighting at Charleston in 1776, and was made brigadier general the following year and placed in command of the Virginia line. He took part in the battles of the Brandywine, Germantown, and Monmouth, and in the capture of Stony Point. He defended Virginia against the expeditions of Leslie and Arnold, and was commander in chief there till the arrival of Steuben. Upon the invasion of Virginia by Cornwallis he was next in command to Lafayette, and at the siege of Yorktown he was in command of the first brigade of light infantry. He retired at the close of the war with the rank of major general. Soon after he settled in Pennsylvania. He served in Congress in 1789-91, 1793-95, and 1799-1801. In the latter year he was chosen United States Senator, but resigned when Congress met to become supervisor of revenue for the district of Pennsylvania, and in 1803 he was appointed collector of the port of Philadelphia, in which position he died near Philadelphia, Oct. 1, 1807. Consult his *Life* by his great-nephew, Henry A. Muhlenberg (Philadelphia, 1849).

MUHLENBERG, WILLIAM AUGUSTUS (1796-1877). An American Episcopal clergyman and philanthropist, grandson of Heinrich Melchior Muhlenberg. He was born in Philadelphia and graduated at the University of Pennsylvania in 1814. Three years later he was ordained deacon and served as assistant to Bishop White at Christ Church, Philadelphia. Ordained

priest in 1820, he was rector from 1821 to 1828 of St. James's Church, Lancaster, Pa., where he helped to establish the first public school in the State outside of Philadelphia. He founded in 1828 at Flushing, Long Island, a school afterward known as St. Paul's, of which he was principal until 1846. Then he was rector of the church of the Holy Communion in New York until 1858, in the latter year becoming superintendent and pastor of St. Luke's Hospital, which he had founded. In the later years of his life he was instrumental in establishing an industrial Christian settlement at St. Johnland, Long Island. He died in St. Luke's Hospital, April 8, 1877. To trace his effect upon his time would be to record the origin of several of the most important movements within the Episcopal church. Thus, he made his New York parish the first free-seat church of his communion in America; he organized the first sisterhood within the same limits in 1845, known as the Sisterhood of the Holy Communion; and the important later developments in the direction of Christian unity (see EPISCOPAL CHURCH) and of liturgical enrichment and flexibility both really grew out of his memorial to the House of Bishops in 1853. Church music and hymnody also owe much to him; he published three books in this department; but his most important literary work is contained in *Evangelical Catholic Papers* (1875-77). For his life, consult biographies by Anne Ayres (4th ed., New York, 1889) and William Newton (Boston, 1890); also Leighton Coleman, *The Church in America* (New York, 1896).

MUHLENBERG COLLEGE. An institution for higher education founded at Allentown, Pa., in 1867. It is under the control of the Evangelical Lutheran church. The college includes preparatory and collegiate departments, with classical, scientific, and philosophy courses leading to the degrees of A.B., S.B., and Ph.D. The total enrollment in all departments in 1914-15 was 213 and the faculty numbered 14. In the library are 21,000 volumes. The campus of 72 acres and the college building are valued at \$755,500. The income from all sources in 1913-14 was \$26,205. The college had an endowment of about \$300,000. The president in 1915 was John A. W. Haas, D.D.

MÜHLFELD, mül'fēlt, RICHARD (1856-1907). A German clarinetist and symphony director, born at Salzgungen. He received musical instruction under Emil Bückner at Meiningen. At 17 an expert clarinetist, from 1875 to 1896 he was a member of the orchestra at the Bayreuth Festival. In 1905 he became chief symphony director at the ducal court chapel of Brunswick.

MÜHLHAUSEN, mül-hou'zen. A town in the Province of Saxony, Prussia, on the Unstrut, 30 miles northwest of Erfurt (Map: Prussia, D 3). It is an old town with a number of churches, of which that of St. Blasius dates from the twelfth century and the church of St. Mary from the fourteenth century, and a mediæval Rathaus. It is surrounded with modern suburbs and has a Gymnasium, a trade and textile school, a seminary for teachers, and a theatre. There are manufactures of woolen and linen goods, carpets, leather, cigars, chewing tobacco, sewing machines, bicycles, furniture, dyes, malt and beer. The city has considerable trade in cattle, grain, and fruit. Pop., 1900, 33,433; 1910, 35,091. Mühlhausen appears in

history as early as 925, when it was a fortified post. It rose to considerable importance as a free city in the fourteenth century, and at the time of the Peasants' War was the headquarters of the Anabaptist leader, Thomas Münzer, who was executed in the neighborhood in 1525. The town was finally incorporated as a part of the Kingdom of Prussia in 1815.

MÜHLHEIM, mül'hīm. See MULHEIM.

MUIR, mūr, JOHN (1810-82). An English Sanskrit scholar. He was born in Glasgow and was educated at the University of Glasgow and the East India School at Haileybury. He engaged in the civil service in British India in 1829-53 and devoted himself to the study of the languages, history, and antiquities of India. In 1853 he retired from the service and settled at Edinburgh, devoting himself to the advancement of Oriental literature, especially in its bearing upon Christianity. In 1846 he offered to the University of Cambridge a prize of £500 for the best treatise on the errors of the Hindu systems of philosophy and on expounding the principles of Christianity to learned natives of India; and he gave, in 1862, £5000 to the University of Edinburgh for the endowment of a professorship of Sanskrit and comparative philology. Muir did much to help the spread of Christianity among the Hindus. His most important work was *Original Sanskrit Texts on the Origin and History of the People of India, their Religion and Institutions* (London, 1858-72; 3d ed., 5 vols., 1872-74), treating of the origin of caste, racial and linguistic affinities of the Hindus, and the Vedas, including Vedic mythology. In 1875 he issued an anthology of Sanskrit proverbs entitled *Religious and Moral Sentiments Metrically Rendered from Sanskrit Writers*, followed by a similar volume called *Metric Translations from Sanskrit Writers* (London, 1879).

MUIR, JOHN (1838-1914). An American explorer and naturalist, born at Dunbar, Scotland, April 21, 1838. He studied at the Dunbar Grammar School and then, having come to the United States, at the University of Wisconsin. After four years he began to explore the less-known portions of the North American continent, devoting his attention particularly to the western coast and to Alaska, where the Muir Glacier (qv) is named for its discoverer. In 1878 he visited the Arctic Regions on the U.S.S. *Corwin* in search of the De Long expedition; in 1899 became a member of the Harriman expedition to Alaska; and subsequently traveled in Russia, Siberia, Manchuria, India, Australia, and New Zealand (1903-04), in South America (1911), and in Africa (1912). John Muir preceded the "conservation movement" many years in his earnest advocacy of the preservation of American forests and the establishment of national parks and reservations, especially in the Sierras, with which his name will always be identified. He became a member of the American Academy of Arts and Letters and received honorary degrees from the universities of Wisconsin and California and from Yale. Muir died at Los Angeles, Dec. 24, 1914. He published: *The Mountains of California* (1894; enlarged ed., 1911); *Our National Parks* (1901; enlarged ed., 1909); *Stickeen* (1909); *My First Summer in the Sierra* (1911); *The Yosemite* (1912); *Story of my Boyhood and Youth* (1913); and nearly 150 magazine and newspaper articles on natural history. He also

edited *Picturesque California*. After his death appeared (1915) *Letters to a Friend and Unpublished Prose and Letters*, containing a practically complete work on Alaska.

MUIR, MATTHEW MONCRIEFF PATTISON (1848–). An English chemist. He was born and educated in Glasgow, studied at the University of Tübingen, and became fellow and prelector in chemistry at Gonville and Caius College, Cambridge. Muir did much to popularize modern chemistry. He published, *Qualitative Analysis and Laboratory Practice* (1874), with T. E. Thorpe; *Chemistry for Medical Students* (1878); *Chemistry* (1883); *A Treatise on the Principles of Chemistry* (1884; 2d ed., 1889); *Elements of Thermal Chemistry* (1885); *Practical Chemistry* (1887), with D. J. Carnegie; *Chemistry of Fire* (1893); *The Alchemical Essence and the Chemical Element* (1894); *The Story of the Wanderings of Atoms* (1898); *The Story of Alchemy* (1902); *The Elements of Chemistry* (1904); *A History of Chemical Theories and Laws* (1906); *The Chemical Elements* (1908).

MUIR, THOMAS (1845–). A British mathematician and educator. He was born near Lanark and was educated at Wishaw Public School, at Glasgow University, and in Germany. For a time he taught in Glasgow, first as assistant professor of mathematics in the University, and then as head of the mathematical and science departments of the high school. He then removed to Cape Town, South Africa, where he was vice chancellor of the University of the Cape of Good Hope (until 1901) and Superintendent General of Education in Cape Colony. His principal publications are a *Treatise on the Theory of Determinants* (1882), *History of Determinants* (1890), and *Theory of Determinants in the Historical Order of Development* (2 vols., 1906–11).

MUIR, SIR WILLIAM (1819–1905). A British administrator and Orientalist. He was born at Glasgow, studied at the universities of Glasgow and Edinburgh, and in 1837 entered the Bengal civil service of the East India Company. Ten years later he was appointed secretary to the Lieutenant Governor of the Northwest Provinces, and during the Indian Mutiny (1857) he was chief of the intelligence department at Agra and successfully took charge of communications upon which largely depended the suppression of the mutiny. When the capital was removed to Allahabad, in 1858, he went there as the Lieutenant Governor's secretary and had the chief share in organizing the government. Unfortunately his plans for raising the largest amount of revenue compatible with the ability and contentment of the natives were not adopted in London, although approved by expert opinion in India. He was provisional member of the Viceroy's legislative council (1864–67), foreign secretary in the Viceroy's executive council (1867), Lieutenant Governor of the Northwest Provinces (1868–74), and financial member of the Viceroy's executive council (1874–76). The heavy land assessments were reduced by him, and the custom of female infanticide among Hindus was tactfully suppressed. His interest in education was shown in the founding of Muir College and Allahabad University. So far as official duties permitted Muir was a diligent student of Oriental literature and thought. He was a profound Arabic scholar and investigated the life of Mohammed

and the history of Islam. His publications include, *Life of Mahomet* (4 vols., 1858–61), an authoritative work; *The Qur'an* (1878), *Ancient Arabo Poetry* (1879); *The Caliphate* (2d ed., 1893), *Agra in the Mutiny* (1896); *The Mohammedan Controversy* (1897).

MUIR GLACIER. One of the largest and best known of the Alaskan glaciers, named after John Muir (q.v.), who discovered it in 1878. The ice stream flows down the slopes of Mount Fairweather, which is over 15,000 feet high, and enters Glacier Bay as a palisade of ice nearly 2 miles long and from 136 to 210 feet high. It forms a barrier across the head of the bay, and its submarine base reaches as much as 760 feet below the sea level. In the lower course the ice moves about 7 feet a day, breaking off at the end in great bergs that float away to the sea.

MUIRHEAD, mūr'héd, JOHN HENRY (1855–). A British philosopher, born in Glasgow. His mother was a kinswoman of James Fredrick Ferrier (q.v.). He studied at Glasgow Academy and University and at Balliol College, Oxford. For a time he was assistant to the professor of Latin at Glasgow; then lectured on philosophy at Bedford College, London, and in 1900 became professor of philosophy in the University of Birmingham. Muirhead was a Hegelian. He was an editor of the *Hibbert Journal* and of a series called "The Library of Philosophy." He translated into English Zeller's *Aristotle and the Earlier Peripatetics* (1897), contributed to *Mind*, and wrote *The Elements of Ethics* (1892, 3d ed., 1910); *Philosophy and Life* (1902), *The Service of the State* (1908), four essays on T. H. Green's political teaching. *The Starting Point of Poor Law Reform* (1910); *German Philosophy in Relation to the War* (1915).

MUIR-MACKENZIE, ma-kén'zī, MONTAGUE (1847–). An English barrister and law writer. He was educated at Charterhouse School and at Brasenose College, Oxford, and was a fellow of Hertford College, Oxford (1874–88). In 1873 he was called to the bar, and he was secretary to Lord Chief Justice Coleridge for the four following years. He became recorder of Deal in 1892 and was a bencher of the Middle Temple from 1894 to 1905 when he became an official referee. His publications are upon technical subjects, such as *Bills of Lading*, *Judicature Acts*, *Laws of Registration*, and *Bankruptcy Acts*.

MUIR WOODS. See NATIONAL MONUMENTS.

MUKADDASI, mookád-dá'sé (Ar *Abū 'Abd Allāh Muhammad ibn Ahmad al Mukaddasi, or al Makdisi*). A famous Mohammedan geographer. He was born at Jerusalem (whence his name *Mukaddasi*=from Jerusalem) in 946. His father was an architect and gave his son a good education. In his twentieth year he made the pilgrimage to Mecca and afterward decided to devote his life to the study of geography. For a score of years he journeyed up and down through the Moslem world, seeking information with infinite labor and excellent judgment. The only Mohammedan countries not visited by him seem to have been India, Sejestan, and Spain. In 985 he published his book, dividing it into three parts. (1) what he had himself seen; (2) what he had learned from trustworthy witnesses; (3) what he had read. He then resumed his travels and three years later issued a new and enlarged edition. *Mukaddasi's*

travels did not reach quite so far as those of some other Arabic geographers, but, judged by the zeal with which he collected his material, the good sense he showed in sifting it, and the clear and logical arrangement of his work, he is easily the foremost of them all. It has been edited by De Goeje in his *Bibliotheca Geographorum Arabicorum*, vol. iii (*Descriptio Imperii Moslemici Auctore Al-Mokaddasi*, Leyden, 1877); the part relating to Syria, including Palestine, has been translated into English with notes by Le Strange in the *Library of the Palestine Pilgrims' Text Society*, vol. iii (London, 1886). Mukaddasi was a trained philologist, but his imitation in the description of each region of the dialect of its inhabitants, though not without its value to us, is more to the credit of his versatility than of his good taste. He was liberal in his religious views and a member of the famous philosophical society of Basra called the *Ikhwan al Safa* (the pure brothers). Consult: August Sprenger, *Die Post- und Reise-Routen des Orients* (Leipzig, 1864); Alfred von Kremer, *Kulturgeschichte des Orients*, vol. ii (Vienna, 1877); G. Le Strange, *Palestine under the Moslems* (London, 1890); Carl Brockelmann, *Geschichte der arabischen Literatur*, i (Weimar, 1898); R. A. Nicholson, *A Literary History of the Arabs* (London, 1907); C. I. Huart, *Histoire des Arabes* (Paris, 1912).

MUKDEN, mōōk-dēn', or **MOUKDEN**. The capital of Manchuria and of the Province of Shengking, situated in a fertile region near the Hun-ho, 110 miles northeast of Newchwang, its port (Map: China, M 3). It is surrounded by a brick wall and is divided into nine parts, of which the central contains the old Imperial palace, the former examination hall, and beautiful administration buildings in the foreign style of architecture. The city is regularly and solidly built, but is of little architectural interest. It is the seat of a considerable industry, and is the converging point for the principal trade routes between northern and southern Manchuria and China. Mukden trades chiefly in agricultural products and fur, and is the seat of the administration of Manchuria. In the vicinity of the city are the tombs of the ancestors of the late Manchu dynasty of China. The population is estimated at about 158,000. The city suffered greatly during the Boxer uprising of 1900, and about it was fought, February-March, 1905, the culminating battle of the Russo-Japanese War (q.v.). Mukden is a clean, well-ordered city. Theoretically it is open to foreign trade. It has rail connection with Sinminting and Antung. Consult Dugald Christie, *Thirty Years in the Manchu Capital* (New York, 1914).

MUKHTAR PASHA, mōōk'tar pā-shū', (AHMED MUKHTAR PASHA EL GHAZI) (1832-). A Turkish general and administrator, born at Brusa in Asia Minor. He was educated at the Constantinople military school, was rapidly promoted, and became successively professor and governor of the school. He served as adjutant in the Crimean War, as a staff officer in the Montenegrin campaign of 1862, and in 1870-71 in campaigns against the Arabs of Yemen, in which he gained the titles of pasha and marshal. He was made commander of the Second Army Corps (1873), and in 1875, at the breaking out of the troubles in Bosnia and Herzegovina, assumed command of the Turkish

forces there. After his defeat at the Duja Pass in the Montenegrin campaign of 1876 Mukhtar was sent to Erzerum to take charge of the operations against Russia on the outbreak of war with that country in 1877. On April 29 he was defeated and driven into Kars, but, in a number of severely contested battles during the following months, his troops displayed great courage and regained the position, defeating the Russians severely near Erzerum on June 25 and compelling them in July to raise the siege of Kars. For his exploits in this campaign the title of Ghazi (victorious) was bestowed upon him. On October 14-15, at Aladja Dag, the Russians gained an important victory over Mukhtar, driving him back to Kars and soon afterward to Erzerum. In November Kars was stormed by the Russians, and before the end of the year Mukhtar was recalled. He put down the Cretan insurrection in 1878 and was put in command on the Greek frontier in 1879. In 1885 he was appointed Turkish High Commissioner in Egypt. In 1912 he was one of the negotiators appointed to conclude a peace with Italy and to pacify Albania. The latter mission was interrupted by the outbreak of the Balkan War. He was appointed Grand Vizier in July, 1912, but resigned in the following October. For his son, see below.

MUKHTAR PASHA, MAHMUD (1867-)

A Turkish soldier and diplomat, son of the Grand Vizier Ghazi Mukhtar. He was born in Constantinople and returned thither in 1893 after seven years' military education in Germany. He took part in the Greco-Turkish War of 1897, in spite of the prohibition of the Sultan. In 1900 he was appointed to a minor office in the War Department and in 1908 was put in command of the First Army Corps. In 1909 he was forced to flee to Greece, but soon returned to Constantinople and received the command of the First Corps. In 1910 he was Minister of Marine in Hakkı Pasha's cabinet and brought about the building of the first Turkish dreadnought. At the outbreak of the Balkan War in 1912 he was again Minister of Marine, but he went to the front, commanded the Third Army Corps at Kirk-Kilissah, and was severely wounded. In April, 1913, he became Ambassador at Berlin. He wrote an account of his experiences in the Balkan War, of which a German and a French version appeared in 1913.

MULA, mōō'lā. A town of southeast Spain, in the Province of Murcia, situated on a branch of the Segura, 18 miles west by north of the city of Murcia (Map: Spain, E 3). The place is unimportant, but has some reputation on account of the warm sulphurous baths known as Baños de Mula, some 3 miles east. Pop., 1900, 12,733, 1910, 11,922.

MULATTO. See MIXED RACES.

MULBERRY (OHG. *mōrberi*, *mūrberi*, Ger. *Maulbeere*, mulberry, from Lat. *morum*, Gk. *μῶρον*, *mōron*, *μῆρον*, *mōron*, mulberry + *berry*, AS. *ber*, *berige*, OHG. *ber*, Ger. *Beere*, Goth. *basi*, *berry*), *Morus*. A genus of trees of the family Moraceæ, natives of temperate and warm climates, with deciduous leaves, unisexual flowers in short, thick spikes, the perianth of the female flowers becoming succulent and closing over the small pericarp to form with other flowers of the spike an aggregate fruit. There have been about 100 species described, but most authors have reduced them to 10 or even less. The

common mulberry, or black mulberry (*Morus nigra*), a long-lived native of the middle parts of Asia introduced into cultivation in Europe more than a thousand years ago, and now naturalized there, is a low, much-branched tree, with thick, rough bark and broad, unequally serrated, and very rough heart-shaped leaves. It is not hardy in the United States as far north as New York, and is seldom seen except in the South and in California, where some of the improved varieties are grown. The fruit, which is purplish black, with dark-red juice, fine aromatic flavor, and subacid sweet taste, is often produced in prodigious quantities and is esteemed for dessert, for preserving, and for wine making. The wood is employed in cabinet-work, but is not of much value. The leaves are sometimes used for feeding silkworms. It is propagated by seed, suckers, layers, or cuttings, and succeeds best in a rich light soil. The white mulberry (*Morus alba*) has been planted in southern Europe since 1540, in India and China, where it is native, from time im-

RED MULBERRY (*Morus rubra*).

memorial for its leaves, which are the best food for silkworms. In North America it has been extensively planted and in places exists in a half-wild state as trees a foot or more in diameter (See KENRICK, WILLIAM). The fruit is almost white, and much less palatable than that of the black mulberry, although there is great difference among the varieties. The best variety for feeding silkworms, on account of its rapid growth and abundant leaves, is that called the Philippine mulberry. A variety called the Russian mulberry is a hardy, rapid grower, well adapted to hedges, windbreaks, small timber, and ornamental plantings, for which purpose it has been extensively planted in the western United States. *Morus multicaulis*, by some considered a variety of *Morus alba*, once grown extensively in the United States to feed silkworms, is seldom seen now. In India the white mulberry is treated as a bush, and cut down twice a year, the stripped shoots being thrown away. Its bark has long been used in China and Japan for making paper. It grows

readily from cuttings. The root has a considerable reputation as a vermifuge. The red mulberry (*Morus rubra*), a native of eastern North America, ranging from New England to the Dakotas and south to southern Florida, is the largest tree of the genus, sometimes attaining in the South a height of 70 feet and 3 feet in diameter. It endures severe frosts much better than the preceding, and is therefore preferred for cultivation in some parts of Europe. Its fruit is deep red and almost as pleasant as the black mulberry. The wood is much more valuable, being fine-grained, strong, durable, and adapted even for shipbuilding. Of each of these three species there are numerous named varieties which are cultivated for their fruits, but they have not received the attention in the United States that they deserve. The Indian mulberry (*Morus indica*) has black fruit of a delicate flavor, and the leaves are extensively used for feeding silkworms in China, Cochinchina, and Bengal. *Morus alba*; *Morus celtidifolia* and *Morus corylifolia*, Peruvian species; *Morus laevigata*, the species most common in the north of India, and *Morus cashmeriana*, probably a form of *Morus indica*, a native of Cashmere, produce pleasant fruit. *Morus dulcis*, a native of the north of India, is said to be superior in flavor to all others.

The paper mulberry (*Broussonetia papyrifera* and *Broussonetia kämpferi*), a native of India, Japan, and islands in the Pacific, frequently planted for ornament and shade in America and Europe, differs from the true mulberry in having the female flowers collected in a globular mass. The fruit is oblong, dark scarlet in color, sweetish, but insipid. The tree is of moderate size, or, in cultivation, a bush 6 to 12 feet high with leaves either simple or lobed. The islanders of the Pacific cultivate this species with great care and make a kind of clothing from the bark. For this purpose branches an inch or more in diameter are macerated in water. The epidermis is then removed by scraping, and the inner bark beaten thin into kapa cloth. The young shoots are also used for paper making in Japan and the East. When the shoots are cut new ones spring up very rapidly. Silkworms eat the leaves. See PLATE OF MULBERRY AND LIQUIDAMBER, accompanying latter title.

MULBERRY FAMILY. See MORACEÆ.

MULCASTER, RICHARD (1530-1611) An English schoolmaster, whose birthplace may have been the old border tower of Brackenhill Castle on the river Line, or perhaps Carlisle. From Eton he passed to King's College, Cambridge, and thence to Christ Church, Oxford, where he graduated MA in 1556. When the Merchant Taylors' School was founded in London (1561), Mulcaster was appointed its first head master, a post which he held till 1586. Here he probably had the poet Spenser as a pupil. Ten years later he was elected high master of St Paul's School. This office he retained to the great age of 78. He was also vicar of Cranbrook (1590), prebend of Salisbury (1594), and rector of Stanford Rivers (1598). He died April 15, 1611. In his own time Mulcaster gained wide repute as an efficient teacher, and in recent times much attention has been given to two books: *Positions, wherein those primitive circumstances be examined, which are necessarie for the training up of children, either for skill in their book or*

health in their bodie (1581), and the *Elementarie, which entreateth chefele of the right writing of our English tung* (1582). Mulcaster strenuously advocated physical training as a part of the education of boys, and implied that there should be grammar schools for girls. He taught his boys music and singing, and permitted them to perform in masques and interludes before the Queen. Consult the reprint of the *Positions*, edited by Quick (London, 1888).

MULCH (more correctly *mulsh*, probably from AS. *molde*, earth mold, ultimately connected with Goth. *malan*, Ir. *melim*, Lith. *malti*, Lat. *molere*, to grind, Eng. *meal*). A covering of loose material, such as brush, leaves, manure, or straw, maintained on the surface of the soil mainly for the purpose of preventing evaporation, which it accomplishes by breaking the continuity of the capillarity in the soil and thus retarding the rise of water to the surface. Stirring the surface soil, and thus maintaining what is termed a soil mulch, brings about the same result. The use of the mulch of vegetable matter is probably not so common as formerly, but the soil mulch is increasing in favor and in arid regions where agriculture is dependent upon irrigation and conservation of moisture is a matter of great importance. In addition to checking evaporation, mulches of vegetable matter are useful in protecting the surface soil from puddling and washing, keeping the soil cool, preventing freezing, and retarding growth in the spring. Mulching is a valuable means of reclaiming washed or galled lands and for securing a growth on dry, bare spots in lawns and meadows. A mulch of barnyard manure not only conserves moisture, but furnishes plant food.

Mulching berry bushes, orchard trees, etc., on a large scale with coarse manure and refuse material is not generally to be recommended, because it interferes with cultivation, harbors insects, and causes the plant roots to remain near the surface, thus increasing the danger of injury by drought. Mulches are, however, found useful in orchards on hilly land very subject to washing, and on a small scale for special purposes, such as protecting small fruits from injury by late frosts by retarding growth in spring. The soil mulch is more generally useful. The depth and character of this soil mulch must be determined by a variety of conditions, among which are the kind and root habits of the plant and the character of the soil and climate. It is evident that any crop, such as corn, with an extensive surface root system, would be injured by the destruction of its roots if stirring were frequent and deep. Again, in arid regions the mulch must be deeper and more perfect than in regions of frequent rainfall, in order to be effective and useful.

MULDER, mool'der, GERARDUS JOHANNES (1802-80). A Dutch chemist, born at Utrecht. After obtaining the degree of doctor of medicine at the university of his native town in 1825, he commenced the practice of his profession at Amsterdam, but was soon invited to teach botany and subsequently chemistry at the medical school at Rotterdam. In 1840 he was elected professor of chemistry at the University of Utrecht, and kept this post until 1868, when he retired from active service. Mulder is best known for his researches on the proteids and for his excellent works on physiological and agricultural chemistry. His *Chemistry of Vege-*

table and Animal Physiology has been translated into English by Fromberg, and his *Chemistry of Wine* by Benze Jones. He also wrote an autobiography under the title *Levensochets* (published posthumously in 1881; 2d ed., 1883).

MULDER, LODEWIJK (1822-1907). A Dutch writer, born in The Hague. He was an instructor in the Royal Military Academy at Breda in 1851-59; was then for a time employed in the Ministry of War as an editor of original documents in early Dutch history, and from 1868 to 1872 was an inspector of schools in Utrecht Province. He prepared manuals of the history of the Netherlands (1859, 12th ed., 1881) and of general history (1862; 8th ed., 1880), and wrote several plays and works of fiction, the last including his best-known work, the historical novel *Jan Faessen* (2 vols., 1856), a tale of the conspiracy against Prince Maurice of Orange, and the comedy *Een gevaarlijke vriendendicnst* (1890).

MULDOR, CARL DE. See MILLER, CHARLES HENRY.

MULE (OF., Fr *mule*, from Lat. *mulus*, mule). A hybrid animal, the offspring of the male ass and the mare, highly valued as a beast of burden. The ears are long, the head, crop, and tail resemble those of the ass rather than those of the horse, but in bulk and stature the mule approaches more nearly to the horse. The mule seems to excel both the ass and the horse in intelligence, its powers of muscular endurance are remarkable, and its sure-footedness particularly adapts it to mountainous countries. It is easily kept, endures hunger and thirst better than the horse, lives to a greater age, and is comparatively free from disease. Great care is bestowed on the breeding of mules in Kentucky, Missouri, and some other central States, in Mexico, and in Spain and Italy, and mules of particular districts are highly esteemed. An extensive experiment in mule breeding at the Mississippi Experiment Station has given instructive results. In America mules are of greatest importance, especially in the Southern States, the census of 1910 giving the number in the country at nearly four and a half million. Texas had over 706,000, while Alabama, Arkansas, Georgia, Kansas, Kentucky, Mississippi, Missouri, Oklahoma, and Tennessee each had over 200,000. The cotton and sugar-cane plantations utilize large numbers because they are easily and cheaply kept. As in other hybrid animals generally, males are more numerous among mules than females in the proportion, it is said, of two or three to one. There is no instance on record of offspring produced by two mules; but rare instances are reported of the female mule producing offspring with the horse and with the ass. The mule is very superior in size, strength, and beauty to the hinny, the offspring of the male horse and the female ass. Several breeds of jacks have been used for producing mules. The chief breeds are Andalusian, Maltese, Catalanian, Italian, and Majorcan. The Catalanian is the best of imported breeds, but in the United States the native jack, a mixture of all breeds, is most used. Black is the preferred color, and the jack should be of good size. The mare should also be well bred and of good form and color. In the Southern States mules are divided into two classes, the smaller ones cotton mules and the larger sugar mules.

MULE, IN SPINNING. See SPINNING.

MULE DEER (so called on account of the large ears), or **BLACKTAIL**. One of the principal species of North American deer (*Odocoileus hemionus*), originally ranging throughout the open regions of the western half of the United States, but by the end of the nineteenth century restricted to the upper valleys of the Missouri and Saskatchewan rivers and to the Rocky Mountain region and the country west and south of it from northern Mexico to southern British Columbia. Four western and southwestern forms are considered to be distinct subspecies. This deer appears never to have ranged east of the plains, and was always most numerous in the broken country of the West and Northwest. Its favorite haunts are the brushy high-lying valleys. Its favorite place in summer is the summits of the mesas and the pastures on the chaparral-covered hills or near the timber line, where it goes to rest along the edge of precipices that give a wide outlook. In winter it comes lower down, and gathers into large herds in the foothills, after the manner of the wapiti (q.v.).

It is somewhat larger than the Eastern or Virginian deer (see **DEER**), and stands about 3 feet, 4 inches high at the shoulder. Its body is rather heavy, and its coat is dull yellowish in summer, rather than reddish, and in winter bluish gray. The ears are very large (suggesting the name) and heavily furred; and its antlers have a short basal snag, above which the beam projects outward and then upward, forking equally and the prongs again dividing, so that there are normally 10 points. The stern bears a yellowish-white disk, and the tail is of moderate length, round, and black at the end. The hide of this species made the best buckskin known to the Indians, and was most used by them for clothing. Its value was soon learned by the pioneers in the West; and from about 1860 to 1870 this deer was pursued so ruthlessly by hide hunters that for several years about 250,000 skins were sent annually to England alone. The venison also is of superior quality, and the haunts and habits of the animal, his craft and speed, make him the most interesting to the sportsmen of all the American deer. The fawns are often domesticated, and the adults thrive well in parks, and are to be seen in every zoological garden in the world. Consult: J. D. Caton, *Antelope and Deer of America* (New York, 1877); A. M. Mayer (ed.), *Sport with Gun and Rod* (ib., 1892); Richard Lydekker, *Deer of All Lands* (London, 1898); T. S. Van Dyke, in Theodore Roosevelt, *The Deer Family* (New York, 1902); especially E. T. Seton, *Life-Histories of Northern Animals* (ib., 1909); and the writings of travelers and sportsmen in the western United States. See **PLATE OF DEER OF NORTH AMERICA**.

MULE KILLER. A local name in the Southern States for several species of insects and land arthropods, such as the mantis, pirate bug, and whip-tailed scorpion (qq.v.).

MULEY-HASSAN, mū'la-hās'san, SIDI (1831-94). A sultan of Morocco. He succeeded his father, Sidi Muley-Mohammed, in 1873. He was energetic and warlike and spent the greater part of his reign in the field, enforcing his authority over the unruly Berber tribes or extending the boundaries of the Empire in the direction of the Sahara. In 1880 reports of shocking cruelties committed on the Jews in his dominion led to the calling of an international conference at Madrid, which drew up a protocol

decreeing liberty of conscience in Morocco, a decision to which the Sultan acceded, but which he altogether ignored.

MULFORD, ELISHA (1833-85). An American Protestant Episcopal clergyman and philosophical writer, born in Montrose, Pa. He graduated at Yale in 1855 and studied for the ministry in the Union Theological Seminary, at Andover, and later at Halle and Heidelberg in Germany. He was ordained a priest in 1862. A part of his career was spent in ministerial work in various charges, but from 1864 to 1877 he lived in his native town without parochial charge and engaged in study. Among his publications are *The Nation*, *the Foundation of Civil Order and Political Life in the United States* (1870) and *The Republic of God: An Institute of Theology* (1881). In 1881 he settled in Cambridge, Mass., and lectured in the Episcopal Theological School there until his death.

MULGRAVE, CONSTANTINE JOHN PHIPPS, second BARON (1744-92). A British naval officer and politician. Entering the navy at 16, he served in the reduction of Martinique and of Havana and in 1765 was made post captain. In 1768 he entered the House of Commons for Lincoln, and became known as one of the King's Friends, a political party which supported George III in the attempt to enforce the principles of arbitrary government, especially in relation to the American Colonies. Five years later he was commanding the *Racchore*, which with the *Carcass* (on which the naval hero Nelson was a midshipman) attempted to find a northern route to India, but was stopped by ice at Spitzbergen. After his return he again sat in the House of Commons (1777-84), and saw active service in naval operations against the French off Ushant (1778) and off Brest (1781). In 1784 Mulgrave was appointed a commissioner for India. Second Baron by succession in 1775, he was made a peer of Great Britain as Baron Mulgrave in 1790. He had the chief part in founding the Society for the Improvement of Naval Architecture. A *Voyage towards the North Pole* (1774) is the account of his Arctic experiences.

MULGRAVE, LORD. See **BUCKINGHAM AND NORMANBY**.

MULHACÉN, MARQUIS OF. See **IBÁÑEZ DE IBÁÑEZ DE IBERO**, CARLOS.

MUL'HALL, MICHAEL GEORGE (1836-1900). A distinguished statistician, born in Dublin, Ireland, Sept. 29, 1836. He was educated at the Irish College in Rome. In 1858 he emigrated to Buenos Aires, where, three years later, he established the *Standard*, said to be the first daily newspaper printed in English in South America. This daring and successful enterprise Mulhall kept going till 1894. Returning to England in 1878, he gave his attention to statistics. In 1884 he was elected to the British Association for the Advancement of Science. Besides numerous contributions to the *Contemporary Review*, his works include: a *Handbook of the River Plata* (1869), the first English book published in Argentina, *Rio Grande do Sul and its German Colonies* (1873); *The English in South America* (1878). In 1880 Mulhall, who had for some time been gathering materials on his favorite subjects of statistics, brought out his *Progress of the World in Arts, Agriculture, Commerce, Manufacture, Instruction, Railways, and Public Wealth*, covering the period from 1800 to the time of its publication. This

was followed by other highly valued works on statistics: *History of Prices* (1885); *Industries and Wealth of Nations* (1896); and a *Dictionary of Statistics* (1883; 4th ed., 1899). Mulhall died Dec. 13, 1900, in Dublin.—His wife, Mrs. MARION MULHALL, is the author of *Between the Amazon and the Andes* (1883) and several essays, including the *Celtic Sources of Dante's Divine Comedy*. For this last monograph she was honored by a chair in the Arcadia of Rome.

MÜLHAUSEN, mül-hou'zen (Fr. *Mulhouse*). The second largest city of Alsace-Lorraine, Germany, situated on the Ill and the Rhine-Rhone Canal, 58 miles south-southwest of Strassburg (Map: Germany, B 5). It is divided into the irregularly built old town, on an island of the Ill, the new town, started in 1826, between the old town and the canal, and the workmen's colony (*cité ouvrière*) on the north. The old town, with the exception of the Rathaus and a few modern churches, dates from the sixteenth century. The border of the canal is the best part of the new town, which has a fine post office and a museum established by the Industrial Society. The society's building also contains natural-history collections, a library, schools of drawing, industrial art, and textile working. The workmen's colony, established in 1853 by Mayor Dollfus, is provided with model dwellings and with reading rooms, schools, restaurants, baths, and other modern institutions. In the suburbs is a good zoological garden. The educational institutions of Mülhausen include a Gymnasium and schools of chemistry and mechanics. It is the most important industrial city of Alsace-Lorraine and one of the largest textile centres of the Empire. This industry of Mülhausen dates from 1746, and the cotton mills are situated partly in the city and partly in the vicinity and specially in the adjacent settlement of Dornach. Over 80,000 persons are said to be engaged in the textile mills and in other establishments connected with the textile industry in the manufacturing district around Mulhausen. Besides cotton and woolen goods and kindred products, there are also manufactured machinery, chemicals, iron, copper, and lead castings, dyes, oil, sewing machines, stoves, starch, cordage, cement, and lumber. It has railway shops and an extensive trade in local manufactures, wine, and the agricultural products of the vicinity. Pop. 1900, 89,012; 1910, 95,041, largely Roman Catholics. Mülhausen first appears in 717, when Adalbert, Duke of Alsace, presented it to the monastery of St. Stephen in Strassburg. It was taken by Rudolf of Hapsburg in 1261 and raised to a free city of the Empire in 1273. In order to maintain its independence it entered into an alliance with the Swiss cantons of Bern and Solothurn in 1466, and in 1515 became a member of the Swiss Confederation and was recognized as such at the Peace of Westphalia. It joined the French Republic in 1798, and passed to Germany with Alsace-Lorraine in 1871. Mülhausen was captured by the French in the early part of the European War which began in 1914. They were later compelled to evacuate it. See WAR IN EUROPE. Consult: Metzger, *La république de Mulhouse* (Lyons, 1883); Schneider, *Geschichte der Stadt Mülhausen* (Mülhausen, 1888); Heydenreich, *Aus der Geschichte der Reichsstadt Mülhausen* (Halle, 1900); Jordan, *Der Uebergang der freien Reichsstadt Mülhausen an Preussen* (Mülhausen, 1902).

MÜLHEIM-ON-THE-RHINE, mül'him, or **MÜHLHEIM**. A town of the Rhine Province, Prussia, on the right bank of the Rhine, 2 miles north of Cologne (Map: Prussia, B 3). Mülheim is extraordinarily well laid out for an old town, has a good harbor, a handsome modern Gothic church, a Realgymnasium, a textile school, and a commercial school. It manufactures wire ropes and cables, velvet, silk, canvas, fire brick, machinery, vehicles, chemicals, electrical appliances, and tobacco, and trades in wine. Pop., 1900, 45,085; 1910, 53,425. Mülheim is of ancient origin, and became a town as early as 1322.

MÜLHEIM-ON-THE-RUHR, -röör. The capital of a circle in the Rhine Province, Prussia, on the Ruhr, 16 miles north of Düsseldorf (Map: Prussia, B 3). It has a church dating from the twelfth century, a Gymnasium, an industrial and commercial school, and a Real-schule. Coal and iron are mined in the district, and there are extensive smelters, manufactures of machinery, tubes, zinc ware, leather, paper, tobacco, cordage, beer, and brandy. Mülheim does a large river business in coal. Pop., 1900, 38,292; 1910, 112,580.

MULHOLLAND, mül'höl'and, WILLIAM (1855-). An American hydraulic engineer. He was born at Belfast, Ireland, and was educated at the Christian Brothers' School, Dublin. Having come to the United States, in 1886 he became superintendent and chief engineer of the water works of Los Angeles, Cal., and in that capacity made plans and estimates and had charge of the construction of the Los Angeles Aqueduct for conveying water from the Sierra Nevada Mountains (250 miles distant) at a cost of \$24,500,000. He served also as a consulting engineer on irrigation and water-power projects.

MULIER, mü-lér', PIETER, THE YOUNGER, called TEMPESTA (1637-1701). A Dutch landscape and marine painter, born at Haarlem, son and probably pupil of the marine painter Pieter Mulier, the Elder (died at Haarlem, 1670)—not, as was for a long time erroneously supposed, son of Pieter de Molyn (qv). After having traveled through Flanders and Holland, he went to Rome and soon acquired a reputation by his pictures of storms at sea (whence his surname, given him by the Italians). He also painted Italian landscapes, with historical or idyllic accessories, in a facile, decorative style with strong light effects. In Genoa, whither he went from Rome, he was imprisoned for 16 years under suspicion of having caused his wife to be murdered. Characteristic works are in the galleries at Dresden, Hamburg, Brunswick, Cassel, Vienna, St. Petersburg, Milan, and elsewhere.

MULITA, mōō-lē'tā (Sp., little she-mule). A small armadillo (*Tatusia hybrida*), allied to the peba, but confined to southern South America; so called from the resemblance of its face and ears to those of a mule.

MULL. The second largest island of the Inner Hebrides, belonging to Argyllshire, Scotland. It is situated north of the Firth of Lorne and is separated from the west coast of Scotland by the Sound of Mull, from 1 to 3 miles wide (Map: Scotland, B 3). It has an area of 347 square miles, is very irregular in shape, deeply indented with bays and sea lochs, and consists mainly of volcanic rock with some outcroppings of granite. The island as a whole is mountainous, rising in Ben More to a height

of 3185 feet. The scenery along the coast is very picturesque, and there are beautiful lakes and woods in the interior where deer and fish attract sportsmen. The scenery in the interior is not striking, the mountains being rounded in outline, and large tracts consisting of moorlands. The soil is fertile, but the stormy and humid climate is unfavorable for agriculture, and the land is chiefly used for grazing—cattle, sheep, and horses being exported. Pop., in 1901, 4334; 1911, 3809. The chief town is Tobermory, on the north coast, with a population (1901) of 1019; 1911, 1079.

MULLAH. See MOLLAH.

MULLA'NY, JAMES ROBERT MADISON (1818-87). An American naval officer, born in New York City. He entered the navy as a midshipman in 1832 and in 1844 was promoted to the rank of lieutenant. During the war with Mexico he participated in the capture of Tabasco. After the outbreak of the Civil War he was commissioned commander in 1861 and captain in 1866, and during the conflict was assigned to duty with the blockading squadron. At his own request he was transferred from the *Bienille* to the *Oncida*, that he might take part in the battle of Mobile Bay, Aug 5, 1864. His ship, one of the last in the line, received a terrific pounding from Fort Morgan, and was attacked by the Confederate ram *Tennessee*, which would probably have sunk it had not the monitor *Winnebago* come to the rescue. As it was, the *Oncida* was disabled by the fire from the fort, many of her crew were killed, and Commander Mullany lost his left arm. After the war and while commanding the North Atlantic squadron (1874-76) he gave material aid to Generals William H. Emory and Philip H. Sheridan at New Orleans, and during a revolution in Colombia protected American interests on the Isthmus of Panama. He became a commodore in 1870, a rear admiral in 1874, and retired in 1879.

MULLEIN, mül'in (AS. *molegn*, mullein) A name given to members of the genus *Verbascum*, of the family Scrophulariaceæ, of which there are more than 100 species, mostly large biennial or perennial herbs with rather thick taproots, and natives of the Eastern Hemisphere. The more or less woolly plants produce flowers upon spikes or panicles. The leaves and flowers were formerly reputed to have medicinal qualities, but are not so recognized in the United States. They contain a sort of mucilage which is obtained by boiling the leaves in water. Three European species are well-known weeds in the United States, the common mullein (*Verbascum thapsus*), the moth mullein (*Verbascum blattaria*), and the white mullein (*Verbascum lychnitis*). *Verbascum phlomoides* is reported as established and spreading as a weed in Kentucky.

MÜLLENHOFF, mül'en-hôf, KARL VIKTOR (1818-84). A noted Germanist. He was born at Marne, Holstein, and after studying at Kiel, Leipzig, and Berlin was professor at Kiel (1846-58) and at Berlin (1858-84). Müllenhoff's greatest works were: *Deutsche Altertums-kunde*, begun in 1870 and not finished till 16 years after his death, the treatise *De Antiquissima Germanorum Poesi Chorica* (1847); *Denkmäler deutscher Poesie und Prosa aus dem 8-12. Jahrhundert* (3d ed., by Steinmeyer, 1892), with Scherer. He also edited important texts. Consult Scherer and Schröder, *Karl Müllenhoff*

(Berlin, 1896), and article in the *Allgemeine deutsche Biographie*, vol. xxii (Leipzig, 1885).

MÜLLER, mül'ler. A family of celebrated quartet players. They were the sons as well as pupils of Aegidius Christoph Müller, the principal musician to the Duke of Brunswick, and were all born in the city of Brunswick.—CARL FRIEDRICH (1797-1873) was first violin in the quartet and was also concert master to the Duke.—THEODOR HEINRICH (1799-1855) was the viola player.—AUGUST THEODOR (1802-75) played the cello, and FRANZ FERDINAND GEORG (1808-55) was the second violin. They were especially educated by their father for quartet work and were conceded to have reduced the art of string-quartet playing to a degree of perfection previously unknown. They were ambitious for greater fame than could be obtained within their own limited environment and were particularly handicapped by the Duke of Brunswick, in whose employ they were, who had formulated the order that none of his musicians should participate in any musical performance outside that connected with his own corps. In 1830 they resigned their employment and made their first appearance in Hamburg, where they met with such success that they were invited to Berlin, in which city they were received with great enthusiasm. An extended tour throughout Germany followed, and in 1837 they per-

COMMON MULLEIN (*Verbascum thapsus*).

formed in Paris. Other successful tours made them known throughout the world. They confined their programmes almost entirely to the works of Haydn, Mozart, and Beethoven and were also a very important influence in raising

and establishing a higher standard of musical appreciation. Consult Louis Köhler, *Die Gebrüder Müller und das Streichquartett* (Leipzig, 1858).

MÜLLER, AUGUST (1848-92). A German Orientalist, born at Stettin and educated at the universities of Halle and Leipzig. In 1874 he became professor of Oriental languages at the former university. In 1882 he became professor of Oriental philology at the University of Königsberg and in 1890 professor at Halle. His numerous and valuable contributions to Oriental literature include: *Die griechischen Philosophen in der arabischen Uebersetzung* (1873); *Der Islam im Morgen- und Abendland* (1885-87); *Hebräische Schulgrammatik* (1878), the syntax of which was translated into English by James Robertson. He also reedited (1876) Caspari's *Arabische Grammatik*, which he considerably enlarged, and with Noldeke published a *Delectus Veterum Carminum Arabicorum* (1890), furnished with copious annotations, and thus rendered useful to those who desire to become acquainted with Arabic poetry. Especially creditable is his edition (1884) of the *History of Physicians* by Ibn Useibia, with Arabic text and a critical commentary. Several of his essays are contained in the *Zeitschrift der deutschen morgenländischen Gesellschaft* and *Beiträge zur Kunde der indogermanischen Sprachen*. In 1887 he was appointed editor of the *Orientalische Bibliographie*.

MÜLLER, mu'lâr', CHARLES LOUIS (1815-92). A French historical painter. He was born in Paris, Dec. 22, 1815, and was a pupil of Baron Gros and Léon Cogniet. He received a first-class medal at the Paris Exposition of 1846. Müller is best known by his masterpiece, the "Roll-Call of the Last Victims of the Reign of Terror," formerly in the Luxembourg Museum. Other works are: "Lady Macbeth" (1849), Amiens Museum, "Charlotte Corday in Prison" (1875), Corcoran Gallery, Washington; "Primavera" (1846) and "Haydée" (1848), Lille Museum, he also decorated the Salle d'Etat in the Louvre. His pictures are skillfully composed, but the coloring and drawing are mediocre. He was made a member of the Institute in 1864.

MÜLLER, mu'ler, CHRISTIAN FRIEDRICH (1782-1816). A German engraver, born at Stuttgart. He first studied under his father, Johann Gotthard Müller, an engraver of note, and subsequently in Paris. In 1808 his engraving of "St. John about to Write his Revelation," after Domenichino, won him a high reputation, which was maintained by his "Adam and Eve under the Tree of Life," after Raphael. In 1814 he was appointed professor of engraving in the Dresden Academy, and the rest of his life was devoted to the execution of the plate of his greatest work, the "Madonna di San Sisto," after Raphael, considered the most exact existing reproduction of the subject. His health broke down under the labor imposed by this undertaking, and he did not live to see a finished print of his work. His engravings are only 18 in number, mostly portraits, including Schiller, Jerome Bonaparte, Jacobi, and a medallion of Napoleon I.

MÜLLER, DAVID HEINRICH (1846-1913). An Austrian Orientalist, born at Buczacz in Galicia. He was educated in Vienna, Leipzig, Strassburg, Berlin, and London; from 1881 to

his death he was professor at Vienna and served as an editor of the *Wiener Zeitschrift für die Kunde des Morgenlandes*. His very valuable works include: *Himjaritische Inschriften* (1875); *Südarabische Studien* (1877); *Die Burgen und Schlösser Sudarabiens* (1879-81); *Sabäische Denkmäler* (1883), with Mordtmann; *Epigraphische Denkmäler aus Arabien* (1889); *Die altsemitischen Inschriften von Sendschirli* (1893); *Epigraphische Denkmäler aus Absassinien* (1894); *Ezechielstudien* (1895); *Die Propheten in ihrer ursprünglichen Form* (1896); *Sudarabische Alterthümer* (1899); *Die Mehr- und Sogotri-sprache* (1902); *Die Gesetze Hammurabis und ihr Verhältnis zur mosaischen Gesetzgebung sowie zu den XII Tafeln* (1903); *Das syrisch-romische Rechtsbuch und Hammurabi* (1905); *Semitica Sprach- und rechtsvergleichende Studien* (1906); *Die Bergpredigt im Lichte der Strophentheorie in Biblische Studien*, No. 5 (1908); *Der Johannes, Evangelist* (1909); editions of *Kitab al Farq* (1876); of Hämðani, *Geography of the Arabian Peninsula* (1884-91); of part of Tabari, *Annales* (1888).

MÜLLER, EDUARD (1828-95). A German sculptor, born at Hildburghausen. His first occupation was that of a cook in the ducal kitchen at Coburg, and he practiced his trade subsequently in Munich and Paris and thence went to Antwerp, where, on the advice of the sculptor Geefs, he proceeded to study at the Academy in 1850. Two years afterward he continued his studies in Brussels and in 1857 settled permanently in Rome. Good composition, truthfulness to life, and a high degree of technical ability are the chief characteristics of his ideal figures and mythological groups, the best known of which include "Nymph Kissing Cupid" (1862); "Faith, Love, and Hope" (1869), Schröder Mausoleum, Hamburg, "Satyr with the Mask" (1870); "The Faun's Secret" (1874); "Eve with her Children" (1880). His masterpiece is the group in heroic size, "Prometheus Bound and the Oceanids" (1874-79), National Gallery, Berlin, chiseled out of a single block of marble.

MÜLLER, FERDINAND VON (1825-96). A German naturalist. He was born in Rostock, studied at Kiel, and in 1848 went to Australia, where he was engaged in botanic explorations (1848-52) and was director of the Melbourne Botanical Garden (1857-73). His researches on the subject of the acclimatization of plants yielded highly valuable results. Müller wrote: *Plants of Victoria* (1860-65); *Fragmenta Phytographia Australis* (1862-81); *Flora Australiana* (7 vols., 1863-70), with Bentham; *Select Extratropical Plants* (1891). A monument was erected in his memory in Melbourne in 1901.

MÜLLER, FREDERIK PALUDAN. See PALUDAN-MÜLLER, FREDERIK.

MÜLLER, FRIEDRICH, called **MALER MÜLLER** (1749-1825). A German poet, painter, and engraver, born at Kreuznach. He showed in his youth a talent for art and began to study painting at Zweibrücken, where his fascinating personality and varied endowments won him the favor of the court circles. In 1774 he went to Mannheim and soon acquired a reputation as a poet. His idyls were inspired, first by Gessner, afterward by Voss (q.v.), some of them being realistic descriptions of the life of the common

people in the Palatinate. He is best known as a dramatist, and as such a true representative of the Storm and Stress period, whose unbalanced enthusiasm is most apparent in *Golo und Genovera*, one of the best imitations of Goethe's *Gotz*. To the theme attempted in *Fausts Leben dramatisirt* his powers were hardly adequate. In 1777 he had become electoral court painter, and in 1778 means were provided to satisfy the artist's longing for Rome. Although he continued there his literary efforts for a time, he more especially cultivated painting, setting up Michelangelo as his idol, but falling into exaggerations and never attaining any real success. Gradually estranged from his art through failures and distress, he devoted himself to art-historical studies, became a sort of ambulant antiquary, and was much sought as a cicerone. Through the patronage of the Crown Prince of Bavaria (afterward King Louis I) he was enabled to pass his declining years in comparative ease. Consult: Seuffert, *Der Maler Müller* (Berlin, 1877); A Saver, in *Deutsche Nationalliteratur*, vol. lxxxi (Stuttgart, 1883); A. Luntowski, *Malers Müller* (Leipzig, 1908).

MÜLLER, FRIEDRICH (1834-98). An Austrian philologist and ethnologist. He was born at Jemnik, Bohemia, studied in Vienna and Göttingen, and from 1866 until his death was professor of comparative philology and Sanskrit at the University of Vienna. He was a member of the Academy of Sciences and was one of the highest authorities on comparative philology and ethnology and the relations of the two sciences. Besides contributing largely on these subjects to the *Mitteilungen der anthropologischen Gesellschaft* and the *Wiener Zeitschrift für die Kunde des Morgenlandes* and editing these periodicals for a time, he wrote the linguistic and the ethnological parts of the *Reise der österreichischen Fregatte Novara* (1867-68); *Allgemeine Ethnographie* (1873; 2d ed., 1879); *Grundriss der Sprachwissenschaft* (1876-87).

MÜLLER, FRIEDRICH MAX, known as MAX MÜLLER (1823-1900). A distinguished Orientalist and philologist. He was born at Dessau in the Duchy of Anhalt-Dessau, Dec. 6, 1823, where his father, the poet Wilhelm Müller (q.v.), was librarian of the ducal library. Max Müller received the elements of his education at Dessau and then went to Leipzig (1836), where, under Hermann Brockhaus, he began the study of Sanskrit. This he soon chose as his special pursuit, and at the age of 20 he was ready for the degree of doctor of philosophy. The first fruits of his labors appeared in a translation of the *Hitopadeśa* (1844, 2d ed., 2 vols., 1864-65). In 1844 he went to Berlin to study under Bopp and Schelling and to consult the Sanskrit manuscripts there. In Paris, whither he went in 1845, he began, at the suggestion of his teacher Burnouf, to prepare an edition of the Rig-Veda, with the commentary of Śāyana (q.v.) With this view he went to England in June, 1846, to examine the manuscripts in the East India House, London, and the Bodleian Library at Oxford, and on the recommendation of the distinguished Sanskritist H. H. Wilson, the East India Company commissioned him (1847) to edit the Rig-Veda at their expense. The first volume of this great undertaking appeared in 1849, and the sixth and concluding volume was published

in 1874. A second edition was issued in 1889-92 (4 vols.). In 1848 Müller went to Oxford, where two years later he was appointed deputy Taylorian professor of modern languages; in 1854 he succeeded to the professorship, and in 1858 he was elected a fellow of All Souls' College. While pursuing his labors connected with the Rig-Veda, he published treatises on a variety of philological topics which did more to awaken in England a taste for the science of language in its modern sense than the labors of any other single scholar. Inheriting the poetic imagination and fire of his father, he had at command such a felicity of illustration that subjects dry under ordinary treatment became in his hands attractive, though it must be admitted that he advanced few new ideas of any value. In 1872 he lectured before the newly established university at Strassburg, returning to Oxford in 1876, where he gave up his professorial duties in order to assume the editorship of *The Sacred Books of the East*. The first series of this vast undertaking was issued in 24 volumes (1879-85), the second in 25 volumes (1886-95), and the third, begun in 1894, was completed by an index by Winternitz in 1910. The lectures which he delivered on the Hibbert Foundation on the *Origin and Growth of Religion* (1878) and the Gifford series on *Natural Religion, Physical Religion, Anthropological Religion, and Theosophy or Psychological Religion* (1890-92), as well as the *Contributions to the Science of Mythology* (2 vols., 1897), attracted much attention. He continued to publish on literary, linguistic, and philosophical subjects up to the time of his death, which occurred at Oxford, Oct. 28, 1900. Among his long list of works mention may be made of a translation into German of Kalidasa's *Meghadūta* (1847), *The Language of the Seat of War in the East* (2d ed., 1855); *Comparative Mythology* (in the "Oxford Essays" for 1856), *History of Ancient Sanskrit Literature* (2d ed., 1860), lectures on *The Science of Language* (1861, last ed., 1891; Ger. trans., Leipzig, 2 vols., 1892-93). *The Science of Religion* (1870). *Chips from a German Workshop*, in four volumes, was published in 1867-75 (new ed., 1895; Ger. trans., 1869-76), the Hibbert lectures on the *Origin and Growth of Religion* (1878, 3d ed., 1880), *Selected Essays* (1881); *India: What can it Teach us?*, lectures at Cambridge (1883; Ger. trans., Leipzig, 1884), *Six Systems of Indian Philosophy* (1899); *Auld Lang Syne* (1st and 2d series, 1899), *Rāmākrishna, his Life and Sayings* (1899). His translation of Kant's *Critique of Pure Reason*, with a scholarly introduction, appeared in two volumes (1881; 2d ed., New York, 1896). He wrote a romance, *Deutsche Liebe* (Leipzig, 1857, 14th ed., 1905), and edited Scherer's *History of German Literature* (New York, 1886). He was one of the foreign members of the Institute of France, a Knight of the Order "Pour le Mérite," a member of the Privy Council of the Queen of England, besides being the recipient of many honorary degrees. After his death appeared his *Last Essays* (1901) and *My Autobiography* (1901), edited by his son. From 1898 to 1904 his *Collected Works* were issued in 20 volumes. Consult *Life and Letters of the Right Honorable Friedrich Max Müller*, edited by his wife (2 vols., London, 1902), and Winternitz, "Max Müller," in *Anthropologische Gesellschaft Mitteilungen*, vol. xxxi (Vienna, 1901). For a criticism

of his work, consult W. D. Whitney, *Max Müller and the Science of Language* (New York, 1892).

MÜLLER, FRIEDRICH VON (1779-1849). A German statesman. He was born at Kenreuth, Bavaria, studied law at Erlangen and Göttingen, and in 1801 entered the administrative employ of Weimar. His greatest political achievement was his inducing Napoleon to keep Weimar independent (1806-07). For this he was rewarded by being ennobled and raised to the post of Privy Councilor. He wrote *Erinnerungen aus den Kriegszeiten von 1806-13* (1851). Müller became Chancellor and Minister of Justice in 1815 and from 1835 to 1848 was a deputy in the Landtag. On his friendship with Goethe, consult Burkhardt, *Goethes Unterhaltungen mit dem Kanzler Friedrich von Müller* (Stuttgart, 1870).

MÜLLER, FRITZ. See MÜLLER, JOHANN FRIEDRICH THEODOR.

MÜLLER, GEORG ELIAS (1850-) A German psychologist, born at Grimma in Saxony. He was educated at the universities of Leipzig, Berlin, and Göttingen, receiving the degrees of M.D. and Ph.D. In 1870 he entered the German army as a volunteer and took part in the campaign against France. On returning to academic life he became privatdocent at Göttingen (1876) and professor of philosophy at Czernowitz (1880). After April, 1881, he was professor of philosophy at Göttingen. Müller was the chief organizer in 1903 of the Gesellschaft für experimentelle Psychologie, of which he was thereafter president. His works in psychophysics are classical, and an uninterrupted series of experiments upon memory, begun in 1887 and continued to the present day, entitle him to rank as the foremost authority in that field. He published *Zur Theorie der sinnlichen Aufmerksamkeit* (1873); *Zur Grundlegung der Psychophysik* (1878); *Zur Theorie der Muskelkontraktion* (1891); *Experimentelle Beiträge zur Untersuchung des Gedächtnisses* (1893), with F. Schumann; *Zur Psychophysik der Gesichtsempfindungen* (1896-97); *Zur Analyse der Unterschiedsempfindlichkeit* (1899), with L. J. Martin; *Experimentelle Beiträge zur Lehre vom Gedächtnis* (1900), with A. Pilzecker; *Gesichtspunkte und Tatsachen der psychophysischen Methodik* (1904); *Zur Analyse der Gedächtnistätigkeit und des Vorstellungserlaufes* (vol. i, 1911; vol. iii, 1913).

MÜLLER, GEORG FRIEDRICH (1805-98). An evangelist and philanthropist whose work was done in England. He was born at Kroppenstädt, Prussia, near Magdeburg, Sept. 27, 1805. He entered the University of Halle (1825) as a divinity student, although his life was anything but exemplary. Late in that year he was converted and in 1826 began preaching. In June, 1828, he was invited to London by the Society for Promoting Christianity among the Jews, to engage in its service for six months, and in March, 1829, reached London. He settled as pastor of Ebenezer Chapel, Teignmouth, in connection with the Plymouth Brethren (1830); in 1832 he removed to Bristol and was coworker with Henry Craik. While at Teignmouth he gave up pew rents and depended on voluntary gifts, for which a box was placed in the chapel. The result was a largely increased income, and from that time on he would take no salary, depending wholly upon voluntary gifts. In December, 1835, after a visit to the Continent,

he published a proposal for the establishment of an orphan house for destitute children bereft of both parents. Spontaneous offers of money and service were received, and the opening of the home was announced May 18, 1836. At the end of 1856 there were 297 orphans under his care. The number of orphans increased, and the buildings were multiplied, until in 1875 "2000 children were lodged, fed, and educated, without a shilling of endowment, without a committee, without organization, by funds drawn from all parts of the world." In 1849 he moved the orphanage to Ashley Down, a suburb of Bristol, to specially constructed buildings. Late in life, attended by his wife, he made evangelistic tours all over the world. His *Narrative* and other books and pamphlets had a large sale and gave information of his work. He died at Ashley Down, March 10, 1898. Consult his biography by A. T. Pierson (New York, 1899) and by Wayne (ib., 1911).

MÜLLER, GERHARD FRIEDRICH (1705-83). A German historian, born at Herford in Westphalia and educated at Leipzig. Entering the newly established St. Petersburg Academy, he gave instruction in history, geography, and Latin and was soon appointed professor of history. In 1740 he went to Siberia and traveled for 10 years, engaged in the study of its antiquities and geography. Of his great work on Siberia only one volume was published (1750). On his return he became historiographer to the Empire and in 1766, after many attacks by his colleagues, was appointed keeper of the national archives. He drew up for the government a collection of its treatises and wrote a number of works on Russian history, in which subject he was a high authority. His most important book, *Collection for the History of Russia*, appeared at St. Petersburg in nine volumes (1732-65). His work in geography and cartography was also important.

MÜLLER, IWAN RITTER VON (1830-). A German classical scholar. He was born at Wunsiedel in Bavaria, studied at Erlangen, and was professor at this university (1862-93) and at Munich (1893-1906). His published works are numerous; he is best known as general editor of the comprehensive *Handbuch der klassischen Altertumswissenschaft* (1885-1906), and also as the editor of many of the works of Galen (qv) and as reviser of Nagelsbach's *Latينية Stilistik* (6th ed., 1888). He published also many articles in learned periodicals and from 1884 to 1897 was editor of Bursian's *Jahresbericht über die Fortschritte der klassischen Altertumswissenschaft*.

MÜLLER, JOHANN FRIEDRICH THEODOR, known as FRITZ MÜLLER or MÜLLER-DESTERRO (1822-97). A German naturalist, known for his contributions to bionomics and to the evolution theory. He was born at Windisch-Holzhausen, near Erfurt. He studied at Greifswald and Berlin. The troubles of 1848 finally drove him from home and Berlin, and he emigrated to southern Brazil, settling at Blumenau. Here he lived the life of a colonist and pioneer until 1856, when he became a teacher of mathematics and natural history in the Gymnasium at Desterro on the island of Santa Catharina. After various changes he was in 1874 appointed *naturalista viajante* of the museum at Rio de Janeiro and lived at Itajahy. Afterward he was suddenly dismissed from his position, with-

out any explanation from the authorities, and returned to Blumenau.

Müller published numerous papers on jelly-fishes and worms, but more particularly on crustaceans and insects, his articles appearing mostly in Wiegmann's *Archiv für Naturgeschichte, Kosmos, Natur* and in the *Annals of the Rio de Janeiro Museum*. His single book, *Facts for Darwin*, was called out by Darwin's *Origin of Species*, and it gave him wide fame. It was written at Desterro in 1863, was published at Leipzig in 1865, and was translated, with some additions, into English in London in 1869. It was the application of Darwinian principles to certain forms of a single class, the Crustacea. In this book we have, in the chapter on the "Progress of Evolution," the first clear statement of the biogenetic law or recapitulation theory afterward restated by Haeckel. He conducted an extensive correspondence with Darwin, who considered Müller's observations of the greatest value in connection with the evolution theory. Müller also proposed the theory of mimicry which bears his name. See MIMICRY.

MÜLLER, JOHANN GOTTHARD VON (1747-1830). A German line engraver, born at Bernhausen, near Stuttgart. He went to Paris in 1770 and studied for six years under Wille. While in the capital he won a number of prizes and was elected to the French Academy. In 1776 Duke Charles recalled him to Stuttgart, where he taught for nine years, and whence he was summoned to Paris to engrave a portrait of Louis XVI, after Duplessis. Next in importance to this is his engraving of Trumbull's "Battle of Bunker Hill." On his return to Stuttgart he became director of the school of engraving. He was elected a member of the principal European academies and was knighted in 1818. He engraved 33 plates in all, of which, besides those mentioned, the best are "Madonna della Sedia," after Raphael; "Schiller," after the portrait by Graf, "St Cecilia," after Domenichino, "Wille," after Greuze; "Madame Vigée-LeBrun," after the portrait by herself. Müller was one of the finest engravers of the late eighteenth and early nineteenth centuries, excelling particularly in portraiture.

MÜLLER, JOHANNES (1436-76). The real name of the German scientist Regiomontanus (qv.).

MÜLLER, JOHANNES (1801-58). The most masterful, accurate, and influential physiologist and morphologist of his time. He was born at Coblenz, Rhenish Prussia, July 14, 1801. He began to study theology, but abandoned it for medicine, beginning his medical studies at Bonn. While there he prepared a prize essay, *De Respiratione Fetus* (1821). He graduated in 1822 and in 1823 went to Berlin and studied with Rudolphi, returning to Bonn as privat-docent of physiology and comparative anatomy. In 1826 he was promoted to be professor extraordinarius and in 1830 to a full professorship. In 1833 he was called to Berlin, where he succeeded Rudolphi as professor of anatomy and physiology. After Meckel's death he edited the *Archiv für Anatomie, Physiologie, und wissenschaftliche Medicin* and remained at Berlin until his death, which occurred April 28, 1858.

With his unusual powers of application, thoroughness, and breadth, his acuteness and

penetration, young Müller opened up in different directions new fields of research. In 1826 he published an important work on specific nerve energies—*Ueber die phantastischen Gesichtseinschimmungen*; in the same year an explanation of the color sensations produced by pressure on the retina—*Zur vergleichenden Physiologie der Gesichtssinnes der Menschen und der Thiere*; in 1827 a work based on his lectures on physiology, in 1829 his work on general pathology, and in 1833 the first part of his epoch-making *Handbuch der Physiologie des Menschen* (Eng. trans., *Elements of Physiology*, 1837-43). This was completed in 1840. In 1834 Müller was elected a member of the Berlin Academy of Sciences. As a physiologist, he was the founder of a new school, working by novel methods. To him physiology owes the foundation of Bell's law, the principle of reflex movements and other nervous activities, comprehensive and detailed views on vision and hearing; a thoroughly well-grounded knowledge of the nature of the blood, lymph, and chyle; the proof of the independence of the quality of glandular secretions from the grosser structure of the glands, and the knowledge of chondrin. An opponent of the school of nature philosophers, Müller placed physiology on a sound basis and led in the development of the new morphology. The science of comparative embryology was greatly enriched by his researches. He discovered the pronephric ducts which bear his name, explained the nature of hermaphroditism, and made extended contributions to and laid the foundations of our knowledge of the embryology and metamorphoses of the elchinoderms. His examination into the mode of development of certain sharks led to his subsequent studies on the ganoids and *Amphioxus*. Müller also experimented on the vocal cords and the voice, advanced the theory of color contrast, and demonstrated the bristle cells of the inner ear. The debt morphology owes him is shown in his discovery of the lymph hearts of the Amphibia, the micropyle of the eggs of fishes, holothurians, and the like; the intimate structure of glands, of cartilaginous and bony tissue, of erectile tissue, of the musculature of the intestines, and the finer structure of the peritoneum. It was he who introduced the idea of fever as a nervous reflex.

Müller's principal work in comparative anatomy and morphology was his *Vergleichende Anatomie der Myxinoideen, etc.* (1835-41). His unfinished work, *Ueber den feineren Bau der krankhaften Geschwülste* (1838), was of great importance in pathological anatomy. In collaboration with Henle he published *Systematische Beschreibung der Plagiostomen* (1841), and in systematic zoology most important were *System der Astenden* (1842), with Troschel, and *Horæ Ichthyologicae*. Besides these he published upward of 250 articles, addresses, and reports, most of which appeared in the *Abhandlungen der berliner Akademie der Wissenschaften* and in the *Archiv für Anatomie, etc.*, and nearly all of which were of great significance. In 1899 the city of Coblenz, his native town, erected a monument to Müller.

Consult the biographical notices by Du Bois-Reymond (*Abhandlungen der berliner Akademie der Wissenschaften*, 1859), containing a list of his works, Virchow, *Johannes Müller: Eine Gedächtnisrede* (Berlin, 1858); Bischoff, *Ueber Johannes Müller und sein Verhältnis zum jetzigen Standpunkt der Physiologie* (Munich,

1858); *Proceedings of the Royal Society of London*, vol. ix, p. 556.

MÜLLER, JOHANNES VON (1752-1809). A German historian. He was born Jan 3, 1752, at Schaffhausen, where his father was a clergyman and rector of the Gymnasium. He studied theology at Göttingen under Heyne, Schlözer, Walch, and others. In 1772, after being admitted to the ministry, he was appointed professor of Greek at Schaffhausen and in the same year published his first work, *Bellum Cimbricum*. In 1778 he went to Geneva, where he studied history at the university and devoted his leisure hours to the investigation of Swiss chronicles and documents. In 1780 he published his *Geschichte der Schweizer* and in 1781 was called to the Collegium Carolinum at Cassel as professor of history and statistics; at Cassel he wrote *Reisen der Papste* (1782; new ed., 1831). In 1786 he was appointed librarian and councilor of state to the Elector of Mainz, here he started his *Geschichte der schweizerischen Eidgenossenschaft* (5 vols., 1786-1808), his *Zur Darstellung des Fürstentums* (1787), and *Briefe zweier Domherren* (1787). In 1787 he was in Rome, became Privy Councilor in 1789, and was knighted by the Emperor in 1791. In 1792 he went to Vienna, where the Emperor made him a member of the Aulic Council (1793), and where he in 1800 became first Imperial librarian. In 1804 he left Vienna for Berlin, where he wrote, among other things, an additional volume of his Swiss history. Introduced to Napoleon after the battle of Jena, he was appointed by him (1807) Secretary of State in the new Kingdom of Westphalia. He died at Cassel, May 29, 1809. His works have all been replaced by more modern researches, but in their own day they were of great value. Besides those mentioned, the *Vierundzwanzig Bücher allgemeinen Geschichte*, based on lectures delivered in Geneva (1811 and often republished), are important. Müller's *Sämmtliche Werke* were published (27 vols., Stuttgart, 1810-19; new ed., 40 vols., 1831-35).

MÜLLER, JOSEF (1855-). A German writer on philosophy and religion. He was born and educated in Bamberg, studied theology and philosophy, was ordained a priest in 1877, but in 1887 retired from clerical work and became a leader of the Reform Catholic movement in Germany, editing its organ, *Renaissance*, from 1900 to 1907. Among his books the most important are those on Richter—including *Jean Paul und seine Bedeutung für die Gegenwart* (1894), *Die Seelenlehre Jean Pauls* (1894), *Jean Paul-Studien* (1900), and a biography (1913)—and *Das Wesen des Humors* (1896); *Philosophie der Schönheit* (1897, 2d ed., 1912); *Keuschheitsidee* (1897, 2d ed., 1912); *Reform-katholizismus, die Religion der Zukunft* (1899; 2d ed., 1900); *Das sexuelle Leben* (3 vols., 1902-04); *Das Bild in der Dichtung* (2 vols., 1903-06); *Moralphilosophische Vorträge* (1904). Consult the autobiographic volume, *Das Leben eines Priesters in unsern Tagen* (Munich, 1903).

MÜLLER, JULIUS (1801-78). A German theologian. He was born at Brieg in Silesia and was a brother of Karl Otfried Müller (q.v.). He studied at Breslau and Göttingen, at first devoting himself to law, but afterward to theology. In 1825 he was appointed pastor at Schönbrunn and Rosen, near Strehlen, where he remained seven years. He was appointed

in 1831 second university preacher in Göttingen, and there lectured on practical theology and pedagogics. In 1834 he became extraordinary professor of theology in Göttingen and soon after full professor in Marburg, whence he went in 1839 to occupy a similar chair in Halle. The work on which his reputation as a theologian chiefly rests is *Die christliche Lehre von der Sünde* (1839; 6th ed., 1889, Eng. trans., from the 5th ed., Edinburgh, 1868), the most exhaustive treatise in all theology on the subject. He also issued *Dogmatische Abhandlungen* (1870). He afterward published pamphlets on subjects of temporary interest, particularly in vindication of the cause of evangelical union against the attacks of the rigid Lutherans. In conjunction with Neander and Nitzsch he edited a periodical entitled *Deutsche Zeitschrift für christliche Wissenschaft und christliches Leben*. Consult his biography by M. Kahler (Halle, 1878) and by L. Schultze (Bremen, 1879); also J. L. Schultze, *Julius Müller als ethiker* (Bremen, 1895).

MÜLLER, KARL OTFRIED (1797-1840). A German archaeologist and philologist, born at Brieg in Silesia. He studied at Breslau and Berlin, where he was the pupil of August Boeckh. His dissertation, *Ægneticorum Libri* (1817), showed the direction of his future studies, which were devoted to the reconstruction of the history of Greek localities and races. In 1817 he was appointed a teacher at the Magdaleneum in Breslau, in 1819 professor extraordinarius of philology at Göttingen, and in 1823 professor ordinarius there. In connection with his studies he traveled widely and in 1839 secured leave of absence for a visit to Greece and Italy. A sunstroke received while he was copying inscriptions at Delphi led to an attack of fever, from which he died at Athens, where he was buried on the Hill of Colonus. His desire to reconstruct the entire ancient life naturally led Müller to a wide range of scholarly activity. His great work was to be his *Geschichte hellenischer Stämme und Städte*, of which he completed volume i, *Orchomenos und die Myer* (1820), and volume ii, *Die Dorier* (1824); a second edition of these works was prepared by Schneidewin (1844; trans. by G. C. Lewis and H. Tufnell, London, 1839). In the same field belonged his treatise, *Ueber die Wohnsitze, Abstammung und ältere Geschichte des macedonischen Volks* (1825), and his *Etrusker* (1828, 2d ed. by Deecke, 1877). His *Handbuch der Archæologie der Kunst* (1830; 3d ed. by Welcker, 1846, trans. by Leitch, London, 1850), though now antiquated in its collections, is of value from the many acute observations it contains. It was accompanied by Müller and Oesterley's *Denkmäler der alten Kunst* (Göttingen, 1834-39), which was continued and completed by Wieseler (1846-56). A third edition appeared in 1877-81; a fourth edition of part ii, *Kunstmythologie*, was begun at Leipzig in 1899. His *Prolegomena zu einer wissenschaftlichen Mythologie* (1825) was based on his belief that the elements of the Greek religion were to be found in analysis of the myths, which would refer the specific names to specific places and tribes. In the last years of his life he undertook to prepare, for the English Society for the Diffusion of Useful Knowledge, a history of Greek literature. A translation by Lewis and Donaldson from the author's manuscript, entitled *A History of the*

Literature of Ancient Greece, an excellent book, was published in London in 1840 and again, with a continuation by Donaldson, in 1858, in volume 1 there is an essay by Donaldson "On the Life and Writings of Karl Otfried Müller." The German original, *Geschichte der griechischen Litteratur bis auf das Zeitalter Alexanders* (1841, 4th ed., revised and continued by E. Heitz, 1882-84), was published by his brother after his death, as well as *Kleine deutsche Schriften* (1841). A collected edition of *Kunstarchaologische Werke*, in five volumes, was published in Berlin (1872-73). Müller was also prominent as an editor. His fine edition, with German translation, of *Æschylus' Eumenides* (Göttingen, 1833) gave rise to a fierce controversy with Gottfried Hermann and his school, while his critical editions of Varro, *De Lingua Latina* (Leipzig, 1833), and Festus, *De Significatione Verborum* (ib., 1839), were long standards and are still valuable. For his biography, consult F. Ranke (Berlin, 1870); C. Dilthey, *Otfried Müller* (Göttingen, 1898). O and E Kern (eds.), *K. O. Müller Lebensbild in Briefen an seine Eltern* (Berlin, 1908), J. E. Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).

MÜLLER, LAURO SEVERIANO (1863-). A Brazilian statesman, born in Santa Catharina. He entered the military school in 1882 and later took an active part in the organization of the movement which established the Republic (1889). He was a member of the Constituent Assembly, serving on the committee which elaborated the republican constitution of Feb. 24, 1891. Afterward he served as deputy and Senator from Santa Catharina to the National Congress. In 1902 he was appointed Minister of Industry, Communications, and Public Works and in this position fostered numerous public improvements, including especially railways and port projects. In 1912 he became Minister of Foreign Affairs. In the endeavor to promote better relations with all the other American republics he made official visits to the United States in 1913, and to Uruguay, Argentina, and Chile in 1915.

MÜLLER, LEOPOLD (1834-92). An Austrian genre painter, born in Dresden of Austrian parents. He was a pupil of Karl Blaas and of Christian Ruben at the Academy in Vienna and worked eight years as an illustrator for the Vienna *Pigaro*. Continuing his studies subsequently, he repeatedly visited Italy and Egypt, and made his name favorably known through a series of scenes from popular life in Italy and Hungary. His best works, however, are his Oriental paintings and sketches, which possess great ethnographic exactness and delicacy and charm of color. Such are "Street Scene in Cairo" (Metropolitan Museum, New York), "Pilgrims to Mecca Resting," "Bedouins in Camp," "Young Copt Woman" (New Pinakothek, Munich). Other works include "The Church of the Carmelites," "In the Cellar" (Rudolfinum, Prague); "The Little Mother" and "Last Task of the Day" (both in the Vienna Museum).

MÜLLER, LUCIAN (1836-98). A German Latinist. He was born at Merseburg and studied at the universities of Berlin and Halle, as well as in Holland. In 1869 he published *Geschichte der klassischen Philologie in den Niederlanden*. In 1870 he was made professor

of the Latin language and literature at the Imperial Philologico-Historical Institute at St. Petersburg. His works, which display great erudition and critical acumen, are marred by his bitter attacks on eminent scholars whose opinions differ from his own. They include his famous *De Re Metrica Poetarum Latinorum præter Plautum et Terentium* (1861, 2d ed., 1894); *Metrik der Griechen und Römer* (2d ed., 1885), a brief but excellent treatise, translated by S. B. Platner (1892); editions for the *Bibliotheca Teubneriana* of Horace (2d ed., 1879), of Catullus (1870), and other Latin poets; editions of Lucilius (1872), Phædrus (1877), Ennius (1884), Nævius (1885), Horace's Odes and Epodes, with German commentaries (1882); Nonius Marcellus (1888). Horace's *Satires and Epistles* (1891-93). His treatise entitled *Ein Horazjubiläum* (1892) contains a short autobiography. Consult also J. E. Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).

MÜLLER, MAX. See MÜLLER, FRIEDRICH MAX.

MÜLLER, MORTEN (1828-1911). A Norwegian landscape painter, born at Holmestrand on the Christiania Fiord. After studying in Düsseldorf (1847-50), first under Tidemand and Gude, then at the Academy under Schirmer, he lived in Stockholm, where in King Karl XV he found a warm friend and patron, and in 1866 went to Christiania, where (1870-73) with K. Bergshen he conducted Eckersberg's school for painting, subventioned by the government. In 1873 he removed again to Düsseldorf, and in 1874 was made a member of the Swedish Academy and court painter. The rugged grandeur of the fiords and mountainous woodland fastnesses of his native country are the favorite subjects of his characteristic landscapes, in which he combines a romantic conception of nature with purely realistic color effects. Representative examples are a "View on Christiania Fiord" (1855) and "Entrance into Hardanger Fiord" (both in the National Gallery, Christiania). "Pine Forest in Norway" (1860, Hamburg Gallery), "Romsdal Fiord" (1876), "Forest Lake by Moonlight" (1892).

MÜLLER, OTTO (1816-94). A German novelist. He was born at Schotten in Hesse, was for some time connected with the court library at Darmstadt, and edited newspapers at Frankfurt and Mannheim. In 1854 he established the *Frankfurter Museum*. He was the author of novels, *Charlotte Ackermann* (1854); *Der Stadtschultheiss von Frankfurt* (3d ed., 1878), treating of Goethe's grandparents; *Aus Petrarca's alten Tagen* (1861), *Der Majoratsherr* (1873); *Schatten auf Hohen* (1881). Consult the biography by Schulte vom Brühl (Stuttgart, 1895).

MÜLLER, OTTO FREDERIK (1730-84). A Danish zoölogist, born in Copenhagen. His contributions to the knowledge of Infusoria are especially valuable. He wrote *Fauna Insectorum Friedrichsdalana* (1764); *Flora Friedrichsdalana* (1767), *Vermium Terrestrium et Fluvialium, seu Animalium Infusoriorum Helminthocorum et Testaceorum non Marinorum Succincta Historia* (2 vols., 1774); *Zoologia Danica s. Animalium Daniæ et Norvegiæ Descriptiones et Historia* (2 vols., 1777-80; 3d ed., 4 vols., 1789-1800).

MÜLLER, PETER ERASMUS (1776-1834). A Danish theologian and antiquary. He was born in Copenhagen and studied at the university there, passing his theological examination in 1791. After spending some time in German universities, he visited France and England. Returning, he wrote numerous works; was appointed professor of theology at the University of Copenhagen in 1801, and in 1830 became Bishop of Zealand, the highest ecclesiastical dignity in Denmark. He was an eminent theologian, and his theological works, including that on the Christian moral system (1808) and other volumes, are highly valued. But his literary reputation rests upon his essays on Danish and Norse antiquities, of which the most valuable are: *Om det islandske Sprogs Vigtighed* (1813); *Kritisk Undersøgelse af Danmarks og Norges Sagnhistorie* (1823-30); and, above all, his *Sagabibliothek* (*Library of the Sagas*) (1816-18).

MÜLLER, SOPHUS OTTO (1846-) A Danish archaeologist, born in Copenhagen, the son of Dr. C. L. Müller, archaeologist and numismatist. He studied philology in his native city, where he obtained the doctorate (1880) with the important essay *Dyreornamentiken i Norden*. In 1878 he became assistant in the Museum of Archaeology, in 1885 inspector, and in 1892 a director in the National Museum. As secretary of the Royal Archaeological Society (after 1881) he edited *Aarboeger for Nordisk Oldkyndighed* and *Nordiske Fortidsminder*, to which he made numerous learned contributions on Danish archaeology. His principal works are *Ordning af Danmarks Oldsaager* (2 vols, 1888-95), with 1300 illustrations, and *Vor Oldsid* (1897), both fundamental works on Danish archaeology. With C. Neergaard he wrote *Danemærke, arkæologisk undersøgt, beskrevet og tydet* (1901).

MÜLLER, THERESE. See MALTEN, THERESE.

MÜLLER, VICTOR (1829-71). A German historical painter. He was born in Frankfurt, where he received instruction at the Stadel Institute under Steinle. He studied afterward at the Antwerp Academy and under Couture in Paris, but became a follower of Courbet, whose technique, the reverse of Couture's, he adopted and subsequently helped to promote in Germany. In 1858 he returned to Frankfurt, where he soon attracted attention with a series of pictures, romantic in subject but thoroughly realistic in conception and treatment and of great coloristic charm, but scarcely understood by a public accustomed to the sentimental trend of the Düsseldorf school of that period. Therefore, in 1865, he removed to Munich, where such revolutionary departures from traditional treatment as the "Sleeping Wood-Nymph" (1863) and "Hero and Leander" were more likely to be appreciated. Out of a cycle from Shakespeare which he painted there "Hamlet in the Graveyard" (1869, Stadel Institute, Frankfurt) is surpassed only by the "Balcony Scene in Romeo and Juliet" (New Pinakothek, Munich). Another of the series, "Ophelia," and two scenes from the "Life of Hartmuth von Cronberg" are also in the Stadel Institute, Frankfurt. His power as a landscape painter is shown in a "Scene from *Les Misérables*" and "Faust on the Promenade," and his charming fairy pictures prepared the way for those of Hans Thoma. To his influence as a colorist was due not only the

introduction of the tone element into the paintings of the Munich school, but also the truer conception of historical characters and a more wholesome observation of nature among the younger generation of artists.

MÜLLER, WILHELM (1794-1827). A German poet, excelling in popular and political songs that attracted great composers, notably Schubert, and also influenced Heine's lyric development. Müller, who was born in Dessau, Oct. 7, 1794, studied philology and history, fought in the War of Liberation, visited Italy (1817-19), was made professor in the Gelehrtenschule at Dessau (1819), and ducal librarian there. He died in Dessau, Sept. 30, 1827. His poems, published under the titles *Müllerlieder* (1818), *Gedichte eines Waldhornisten* (1821), *Lieder der Griechen* (1821-24), *Lieder des Lebens und der Liebe* (1824), *Lyrische Reisen* (1827), were collected with other works by Schwab in five volumes (1830). An excellent edition by Müller's son, the Orientalist, Friedrich Max Müller (q.v.), appeared in 1868, the *Poems* were published in one volume (1874). A complete critical edition by J. T. Hatfield appeared in 1906 (Berlin). Consult B. Hake, *W. Müller, Leben und Dichten* (Berlin, 1908).

MÜLLER, WILLIAM JAMES (1812-45). An English landscape and figure painter, born at Bristol, whither his father, a Prussian scholar, had migrated. He studied with James Pyne, landscape painter, and in 1833 exhibited for the first time at the Royal Academy the "Destruction of Old London Bridge, Morning." He spent seven months traveling in Germany, Switzerland, and Italy, and in 1838 he visited Greece and Egypt. In 1841 he published his "Picturesque Sketches of the Age of Francis I," the fruits of a visit to France, and the same year he joined the government expedition to Lycia, the results of which were paintings of Oriental life and scenery, five of which were exhibited at the Royal Academy in 1845. Among these are "The Tent Scene, Xanthus," the "Burial-Ground at Smyrna," and "Head of a Cingari." A fine collection of the sketches made at this time is in the British Museum. He is excellently represented in the Tate Gallery by about 80 paintings and sketches in oil and water color, and in the South Kensington Museum by a number of water-color drawings. Müller died at Bristol. His art was original and powerful. His English landscapes are perhaps wanting in simplicity and local color and atmosphere, but his glowing Eastern scenes, with their broad brushwork, admirable light effects, and pure strong color, place him in the foremost ranks of painters of the Orient. Consult the *Memoir* by Solly (London, 1875).

MÜLLER, MÜLLER, WILHELM MAX (1862-) An American Oriental scholar, born at Gleisenberg, Germany, and educated at Erlangen, Berlin, Munich, and Leipzig, where he received his Ph.D. After 1888 he resided in the United States, and after 1890 he occupied a chair in the Reformed Episcopal Seminary in Philadelphia. During various periods he was engaged in archaeological researches in Egypt, being sent there in 1904, 1906, and 1910 by the Carnegie Institution. Müller also lectured on Egyptology at the University of Pennsylvania. His writings include *Asien und Europa nach altägyptischen Denkmälern* (1893); *Die Liebespoesie der alten Aegypter* (1899), *Egyptological*

MULLETS AND ALLIES

- 1 GULF SILVERSIDES (*Menidia peninsulae*)
- 2 BARRACUDA (*Sphyræna barracuda*)
3. COMMON MULLET (*Mugil cephalus*)
- 4 SLIMEHEAD (*Beryx splendens*)

- 5 SAND-EEL (*Ammodytes Americanus*)
6. CALIFORNIA 'SMELT' (*Atherinops Californiaensis*).
- 7 AMERICAN SURMULLET (*Mullus auratus*).
8. GULF BARBUDO (*Polydactylus Virginicus*)

Researches (1906, 1910 et seq.). He was also a contributor to the *Encyclopædia Biblica* and the *Jewish Encyclopædia*, and after 1905 served as joint editor of the *Gesenius Hebrew Dictionary*.

MÜLLER, WOLFGANG, called MÜLLER VON KÖNIGSWINTER (1816-73). A German poet and novelist, born at Königswinter on the Rhine. He studied medicine at Bonn and practiced at Dusseldorf, but afterward removed to Cologne and gradually gave up medicine to devote himself to literature. Müller's poetry finds its material in the Rhine, its beauty, its legends, and the life of its people. The more important of his books are: *Gedichte* (1847; 3d ed., 1868); *Der Rattenfänger von Sankt Goar* (1856); *Niederbuch* (1857, 4th ed., 1871); *Lorelei*, an epic cycle (1851; 4th ed., 1873); *Erzählungen eines rheinischen Chronisten* (1860-61); *Im Rittersaal* (1874). His best-known poem is "Mein Herz ist am Rhein." Six volumes of his selected poems were published under the title *Dichtungen eines rheinischen Poeten* (1871-76). Consult Joesten, *Wolfgang Müller von Königswinter* (Cologne, 1895).

MÜLLER-GUTTENBRUNN, gu'ten-brun, ADAM (1852-) An Austrian author, sometimes using the pseudonym Ignotus, born at Guttenbrunn and educated at Hermannstadt and Vienna. In 1879 he removed to Vienna from Linz. His first success was *Des Hauses Fouchambault Ende* (1880), supplementing Augier's drama *Les Fouchambault*. This was followed by *Im Banne der Pflicht* (1882), the comedy *Schauspieler* (1883), with Laube, and *Irma* (1885). Among his novels and stories, which for the greater part appeared serially, the best known are: *Frau Dornroschen* (1884, 3d ed., 1891); *Gescheiterte Liebe* (1889); *Die Magyarn* (1896); *Gotzendämmerung* (1908). *Der kleine Schrab* (1910, 10th ed., 1912), *Die Glocken der Heimat* (1911; 8th ed., 1912); *Es war einmal ein Bischof* (1912), *Der grosse Schuabenzug* (1913).

MÜLLER-URY, ADOLFO (1864-) A Swiss-American portrait painter. He was born in Airolo, Switzerland, and studied under Deschwanden in Switzerland, at the Munich Academy, and at the Ecole des Beaux-Arts, Paris, under Cabanel. After spending two years (1883-85) in Rome, he came to America in 1886. Although he painted many religious pictures, he is best known for his portraits of prominent personages in Europe and America. These include Pope Pius X, Cardinals Hergenrother, Hohenlohe, and Merry del Val, Lord and Lady Strathcona, Lord Mount Stephen, Emperor William II (1909, New Palace, Potsdam), President William McKinley, General F. D. Grant, Senator and Mrs. Chauncey M. Depew, J. Pierpont Morgan, and James J. Hill.

MULLET (OF., Fr. *mulet*, dim. of *mulle*, from Lat. *mullus*, red mullet). Any one of a variety of useful fishes, principally of the family Mugilidae. In this family the body is nearly cylindrical, with large scales and two widely separated dorsal fins, the first with four stiff spines. The mouth is small. The best-known mullets belong to the genus *Mugil*, of which there are many species found in all warm waters. The common or striped mullet (*Mugil cephalus*) is the largest (10 to 12 pounds) and best of all. It occurs on both coasts of America, and also in Europe. It often ascends rivers,

and searches for soft or fat substances for food, frequently obtained by thrusting its mouth into the mud. It is easily reared in ponds, readily answers the call which usually summons it to be fed, and was in great request among the ancients. Mulletts are used fresh, salted, and smoke-dried. A preparation of their roe, called botarcha, is in great esteem as a condiment in Italy and the south of France. They are often caught in the Mediterranean by angling from a rock, with a bait paste, when they have been previously attracted to the spot by macaron thrown into the water. The white or blueback mullet (*Mugil curema*) is found on both shores of America, and is of importance as a food fish. An abundant species about the Florida Keys is the fan-tailed mullet (*Mugil trichodon*). Mulletts are very numerous in surface-swimming shoals in the lagoons of the Gulf coast in late winter and spring, and are captured generally by means of casting nets. Among the fishermen of Spanish America, mulletts are called liza, lizita, and macho, with descriptive adjectives for the various species.

The name is also given in the western and southern United States to various suckers of the genus *Moxostoma*. Consult G. B. Goode, *Fishery Industries*, sec. 1 (Washington, 1884). See PLATE of MULLETTS AND ALLIES.

MULLET (OF. *molette*, *mollette*, Fr. *mollette*, rowel, from Lat. *mola*, millstone). In heraldry, a charge (originally interchangeable with the estoile) in the form of a star, generally with five points, intended to represent a spur rowel. See CADENCY.

MULLET, ABRAM B. (c.1820-1890) An American architect, born in Ohio. His professional training was obtained in the offices of local architects. In 1865 he was appointed supervising architect of the Treasury, having charge of the design and construction of all Federal buildings, which post he occupied until 1875. He designed the War, State, and Navy Department Building at Washington, the post offices of New York and Boston, and many other important buildings, in a hard and mechanical version of the French Renaissance style. While his work wholly lacked artistic refinement, it set an example of solid and durable construction at a time when not only artistic taste but apparently all sense of good building seemed to be dead in the United States.

MULLIGAN LETTERS. A series of letters written by James G. Blaine (q.v.) to Warren Fisher, a business associate, which, it was alleged, proved corrupt connection, on the part of Blaine, with legislation in Congress favoring the Little Rock and Fort Smith Railroad and the Northern Pacific Railroad. The letters were obtained from Fisher by one James Mulligan, a former clerk of Fisher, who had been called to Washington to testify before a committee of the House of Representatives appointed to investigate the charges against Blaine. Blaine obtained the letters from Mulligan, and on June 5, 1876, read them before the House, after defying the committee to compel him to surrender them. The letters were freely used in the presidential campaigns of 1876 and 1884 by the opponents of Blaine, who took full advantage of the suspicious sound of several detached sentences. By the adherents of Blaine it was asserted that the letters did not prove corruption or even participation in discreditable business and political transactions on his part. Consult Peck, *Twenty*

Years of the Republic, chap. i (New York, 1906).

MULLINGAR, mŭl'lin-gär'. The capital of County Westmeath, Ireland, on the Brosna, 50 miles west by north of Dublin, with which it is connected by rail and by the Royal Canal (Map: Ireland, D 4). It is a centre for agricultural products, and the most important horse and cattle fairs in Ireland are held here periodically. Pop., 1901, 4500; 1911, 5539.

MULLINGER, mŭl'in-jēr, JAMES BASS (1834-). An English historian, born at Bishop Stortford. He was educated at University College, London, and at St. John's College, Cambridge, where he graduated with high honors. After lecturing in 1881-83 at Bedford College, London, he became lecturer to the Teachers' Training Syndicate, at Cambridge, on the history of education (1885-95), and lecturer on ecclesiastical history in Trinity College (1890-94). He wrote: *The Ancient African Church* (1869); *The University of Cambridge from the Earliest Times to the Decline of the Platonist Movement* (4 vols., 1873-1914); *The Schools of Charles the Great* (1876); *An Introduction to English History*, with S. R. Gardiner (1881, 7th ed., 1913); *The Age of Milton*, with Canon Masterman (1897); *History of St John's College, Cambridge* (1901).

MULLION (corrupted from *munnion*, from Fr. *mougn*, stump of an amputated limb, from OF *moign*, from Lat. *manus*, maimed). A vertical member used to subdivide an opening, as a window or triforium arch, into two or more divisions within the main framework. It was practically unknown to all ancient styles of architecture. In the early Christian (especially Syrian), Byzantine, and Romanesque styles it occurs with increasing frequency in the very simple form of a circular shaft or colonnette (sometimes a small pier) subdividing a window or an arch of a gallery into two arched openings.

It was in the Gothic style that the mullion received a distinctive organic development through the use of tracery owing to the enormous increase in the size of windows and other openings, necessitating the multiplication of minor members. The typical cathedral window has from two to six mullions forming subordinate divisions or lights, and their profiles are varied and rich, being often a group of shafts and a composition of fillet and cavetto moldings. These Gothic mullions are exquisitely slender and far removed from the heavy pre-Gothic mullion colonnette. (See TRACERY.) The Renaissance architects abandoned the mullion, returning to the antique idea of undivided openings. Only occasionally is a single colonnette used as a window mullion, especially in early work.

MÜLLNER, mŭl'nēr, ADOLF (1774-1829). A German dramatist and critic, a nephew of G. A. Bürger, born at Langendorf, near Weissenfels, Saxony. He studied law in Leipzig and practiced it at Weissenfels until 1816. Encouraged by the success in an amateur theatre of several comedies, as, e.g., *Der angolische Kater* (1815), skillfully composed after French models, he produced in 1812 a one-act tragedy, *Der neunundzwanzigste Februar*, in imitation of Werner's *Der vierundzwanzigste Februar*. (1812), the first of those fate dramas with which the German stage was flooded during the following decade. Surpassing its model in the accumulation of horrors, Müllner's play lacked the innate poetry which was the redeeming feature of Zacharias

Werner's (q.v.) production. The same applies to his best-known work, *Die Schuld*, a four-act drama, based on the story of a young man who, according to a prophecy, is destined to kill his brother. This typical fate tragedy was brought out in Vienna in 1813, and subsequently on all the principal stages of Germany, retaining its popularity for some years, although its effectiveness was due mainly to clever technical construction. Consult. Schütz, *Müllners Leben, Charakter, und Geist* (4 vols., Meissen, 1830); Hohn, *Zur Biographie und Charakteristik Müllners* (Wohlau, 1875); Minor, *Die Schicksals-tragodie in ihren Hauptvertretern* (Frankfurt, 1883); Foth, *Die Schicksals-Idee in der deutschen Tragodie* (Leipzig, 1895).

MULOCK, mŭ'lok, DINAH MARIA. An English author. See CRAIK, DINAH MARIA.

MULOCK, SIR WILLIAM (1843-). A Canadian jurist and statesman, born at Bondhead, Ontario, and educated at the University of Toronto. He was called to the bar in 1868, and practiced his profession in Toronto, where he became one of the leaders of the bar. In 1888 he was made queen's counsel. In 1882 he was elected a Liberal member of the Dominion House of Commons, and in 1896 was made Postmaster-General in the administration of Sir Wilfrid Laurier. The establishment of a penny-postage rate between Canada and other portions of the Empire was mainly due to him, and he also strongly advocated an all-British cable system, and procured direct steamship communication between Canada and South America. While Postmaster-General he introduced legislation establishing the Department of Labor and was its first minister (1900-05). In the latter year he was appointed the first Chief Justice of the Exchequer Division of the High Court of Justice for Ontario. He was vice chancellor of the University of Toronto in 1881-1900. Deeply interested in the movement for international peace and arbitration, in 1907 he was chairman of the board of conciliation respecting the coal strike in British Columbia. In 1902 he was knighted (K.C.M.G.).

MULREADY, mŭl-rēd'ī, WILLIAM (1786-1863). An Irish genre painter. He was born at Ennis, County Clare, but his father moved to London when William was a child. He early showed artistic powers, which were encouraged by the sculptor Banks, through whose influence he gained admittance to the academy schools. He began as an illustrator of children's books, and his first painting of importance, "Returning from the Ale House," now in the Tate Gallery, London, under the title "Fair Time," appeared in 1809; his later works, "The Carpenter's Shop," "Punch," and "Idle Boys," commanded very general attention. Mulready was elected an associate of the Royal Academy in 1815, and the following year, on the merits of his picture entitled "The Fight Interrupted" (South Kensington Museum), he was made Academician. His subjects, though of the popular order, are painted with great carefulness and fidelity to detail. They are rather small in size, and closely resemble the Dutch school, but are spoiled by gaudy color.

Mulready's most important pictures are in the South Kensington Museum and in the Tate Gallery. In the former are 33, among them "Hampstead Heath" (1806); "Giving a Bite" (1836); "First Love" (1839); "The Sonnet" (1839); "Choosing the Wedding Gown" (1846)

"The Butt" ("Shooting a Cherry") (1848). In the latter are five, including a "Snow Scene." "Young Brother" and "The Toy Seller" are in the National Gallery, Dublin, and his "Wolf and the Lamb" is in royal possession. An early marriage, contracted soon after his arrival in London, was productive of much unhappiness. Throughout his life Mulready was a successful and painstaking teacher. Consult Stephens, *Memorials of Mulready* (London, 1867).

MULTAN, or **MOOLTAN**, mool'tan'. The capital of a district of the same name, Punjab, British India, 190 miles southwest of Lahore and 4 miles from the left bank of the Chenab, the inundations of which sometimes reach the city (Map India, B 2). It possesses railway communication with all the principal cities of India and has, in the Indus Valley Railway, a commercial outlet from Central Asia, the Punjab, and the United Provinces, to the Arabian Sea at Karachi. Steamers ply to Hyderabad, a distance of 570 miles. The city, situated in a district remarkable for its fertility, is built on a mound consisting of the ruins of ancient cities, and is surrounded by a dilapidated wall from 10 to 20 feet high. Large and prosperous suburbs have grown up in recent times. The vicinity abounds in mosques, tombs, and shrines, attesting the city's antiquity and former magnificence. The most important of these, situated in the old fort, is the tomb of Rukn ul Alam (pillar of the world), dating from 1340, an octagonal red-brick structure covered with multicolored glazed tiles and raised mosaics and forming a conspicuous object in the surrounding landscape. The tomb of Bhawal Hakk, dating from 1264, the tomb of Shams i Tabriz, and the Hindu temple of the Narasingh Avatâr of Vishnu are also noteworthy. The bazars are numerous, extensive, and well stocked, and the stores are adequately supplied with European and Asiatic commodities. There are a fine public garden, several high schools for boys, and a convent school for girls. There are manufactures of silks, cottons, shawls, scarfs; brocades, tissues, carpets, shoes, tin boxes, enamel ware, and pottery, and extensive banking interests, but Multan is most important as a trade centre. It holds an annual horse bazar. The local merchants are proverbially rich. Multan is a military station, with an important cantonment $1\frac{1}{2}$ miles to the east. It was taken by the British in the second Sikh War, in January, 1849. Pop. 1901, 87,394, 1911, 99,243.

MULTIPLE (ML. *multiplus*, manifold, from Lat. *multus*, many + *-plus*, fold). An integral number divisible without remainder by another integral number. Thus, 35 is a multiple of 7 and also a multiple of 5. *Equimultiples* are multiples containing different numbers an equal number of times, e.g., 21 and 33 are equimultiples of 7 and 11. The *least common multiple* of several numbers is the least number containing each of them without a remainder. The least common multiple contains all prime factors not common to all of the numbers, and all common prime factors with their highest exponents. Thus, the least common multiple of $5 \cdot 7$ (i.e., 35), $3^2 \cdot 2$ (i.e., 18), and $7^2 \cdot 2^2 \cdot 5$ (i.e., 980) is $5 \cdot 7^2 \cdot 2^2 \cdot 3^2$ (i.e., 8820).

Mathematical expressions which satisfy given conditions for different numerical values are said to be multiple-valued; e.g., $\sin^{-1}x$ (i.e. the angle whose sine is x) is two-valued between 0° and 360° ; thus, if the sine equals $\frac{1}{2}$, the angle has

two values, 60° , 120° . (See TRIGONOMETRY.) Contacts above the first order between curves or surfaces are called multiple contacts. A multiple point of a curve is a singularity composed of several coincident points; e.g., if the curve crosses itself twice at the same place, the intersection is called a triple point. A double point admits of two tangents, a triple point admits of three tangents, and so on, and these are called multiple tangents.

MULTIPLE PERSONALITY. See DOUBLE CONSCIOUSNESS.

MULTIPLICATION (Lat. *multiplicatio*, from *multiplicare*, to multiply, from *multiplex*, manifold, from *multus*, many + *phicare*, to fold, Gk. *πλέκειν*, *plekein*, to twine). One of the fundamental processes in arithmetic and algebra. In arithmetic the symbol for multiplication is \times or the period, the latter being slightly raised in the United States to distinguish it from the decimal point, but not being raised in the European books, where the decimal point is either a comma or a raised period. In algebra the symbol is the period or cross (as in arithmetic) or simple juxtaposition. For example, $a \cdot b$, $a \times b$, ab , are symbols for a times b . Multiplication may be defined as the process by which a number called the *product* is formed from a number called the *multiplier* in the same way that this multiplier is formed from unity. For example, the number -3 may be formed from unity by the process symbolized as $-(1 + 1 + 1)$, and similarly the product $-3 \cdot 4$ may be formed by the process $-(4 + 4 + 4) = -12$. Elementary multiplication is subject to the associative and distributive laws (qqv); but there are branches of higher mathematics in which exceptions occur. (See QUATERNIONS; SUBSTITUTION.) For a method of checking multiplication, see CHECKING.

In a series of operations multiplication takes precedence over addition and subtraction. For example, $2 + 3 \cdot 6 - 4$ equals $2 + 18 - 4$, not $5 \cdot 2$. The operation of multiplication can be abbreviated by the use of logarithms (qv), the slide rule (qv), or tables of products and factors or of quarter squares. The plan of multiplication by means of Napier's rods (*Rabdo-logue sive Numerationis per Vigulas Libri Duo*, Edinburgh, 1617) has been revived through the manufacture of sets of *riglettes multiplicatrices* planned by Genaille and Lucas (Paris, 1885). Growing out of the demand for a system by which prime numbers could be detected, there appeared, in the seventeenth century, numerous tables in the theory of numbers. In 1728 Poëtius published a table of factors for numbers up to 100,000. In 1770 Lambert arranged such a table in modern form for numbers up to 102,000. Burkhardt's table (1814-17) includes factors of numbers to 36,000, and Crelle, Pase, and Glaisher have carried these to 9,000,000. The oldest of the large tables is that of Crelle (7th ed., with an introduction by Bremiker, Berlin 1895). This gives the products to $1000 \cdot 1000$. Zimmermann's *Rechentafel* (Berlin, 1889) and Müller's *Multiplicationstabellen* (Karlsruhe, 1897) give the products to $100 \cdot 1000$, and are well arranged. For the products to $100 \cdot 100$, Jordan's *Mathematische und geodätische Hilfstafeln* (9th ed., Hanover, 1895) is one of the best. The most elaborate table of prime numbers is that of Lehmer, which gives all such numbers from 1 to 10,006,721. Products have also been tabulated by means of quarter squares,

a relation known to the Arabs and doubtless of Hindu origin. The construction of these tables depends upon the identity

$$ab \equiv \frac{(a+b)^2}{4} - \frac{(a-b)^2}{4};$$

thus, the product of any two numbers is given by subtracting the quarter square of their difference from the quarter square of their sum. Among the various tables of this type, Laundry's (1856) contains the quarter squares of all numbers up to 100,000. Blater's (Vienna, 1887), complete to 200,000, is regarded as the best. See CALCULATING MACHINES.

MULVANEY. A character in Rudyard Kipling's "Soldiers Three" in *Plain Tales from the Hills* (1888).

MULVIAN BRIDGE. See MILVIAN BRIDGE.

MUM. See BEER.

MUMBO JUMBO. A strange bugbear described by Mungo Park as common to the Mandingo towns of Africa and used to discipline quarrelsome wives of the natives. The person assuming the character is clothed in a suit made of bark. After various rites the offender is seized by Mumbo Jumbo, stripped, tied, and whipped with his rod. The name is used in a wider sense of negro idols and fetishes, as well as in reference to the secret societies of the West African natives.

MUMFORD, mŭm'fôrd, JAMES GREGORY (1863-1914). An American physician, born at Rochester, N. Y. He studied medicine at Harvard (M.D., 1890) and practiced in Boston from 1890 to 1912, during which time he taught at Harvard Medical School and was connected with several hospitals. Thereafter till his death he was physician in chief at the Clifton Springs (N. Y.) Sanatorium and Hospital. He is the author of *Mumford Memoirs* (1900); *Narrative of Medicine in America* (1903); *Surgical Aspects of Digestive Disorders* (1907), with A. K. Stone; *Surgical Memoirs and Other Essays* (1908); *One Hundred Surgical Problems* (1911); *Practice of Surgery* (1910; 2d ed., 1913); *A Doctor's Table Talk* (1912).

MUMMERS. See MOMIERS.

MUMMICHOG (North American Indian name). A small minnow-like fish of sluggish tidal streams of the eastern United States. See KILLIFISH.

MUMMIUS. 1. LUCIUS MUMMIUS (c.185-130 B.C.). A Roman commander of plebeian birth. In 146 B.C. he was elected consul and placed in command of the war against the Achaean League. (See ACHÆA.) The first battle, fought near Corinth, resulted in the complete defeat of the Grecian allies. Corinth, Thebes, and Chalcis were plundered and then destroyed by the Roman troops. As trophies of his victory, Mummius caused many of the most valuable works of art to be sent to Rome. The surname of Achaicus was given to Mummius, and a triumph was decreed to him. Cicero speaks of him as a blunt and plain but honest man and says that of all his enormous plunder none was reserved for his own use. In 141 he was again elected consul. Nothing certain is known about his later life or his death. 2. SPURIUS MUMMIUS, brother of Lucius, legate of his brother in Achaia. He is chiefly known as pioneer writer among the Romans of the poetic epistle; he sent humorous letters in verse to friends at Rome describing his experiences in Greece. (Consult Cicero, *Epistulae ad Atticum*,

xiii, 6, 4.) Both brothers had a modest reputation as orators.

MUMMY (Ar., bitumen). Strictly speaking, the word "mummy" is applied to bodies which have been so preserved by one means or another as to defy disintegration for a long time. Thus, there are mummies of the ancient Peruvian race which seem to owe their preservation to the desiccation resulting merely from the dryness of the climate. But by general consent the term has come to be applied usually to bodies, whether of human beings, animals, fish, or reptiles, and even insects, found in Egypt, which have been preserved by the use of bitumen, spices, gums, or natron, a substance made up of carbonate, sulphate, and chloride of soda. Instances are known in which bodies have been preserved by immersion in honey. See EMBALMING.

The oldest mummy in existence for which an authentic date is afforded is that of Seker-em-sa-f, the son of Pepi I, which was found at Sakkara. It dates about 3000 B.C., and the evidence furnished by it indicates that the process of mummifying had already been highly developed by this time. In fact the existence of a stele dating about 4000 B.C. leads to the supposition that as early as this it was practiced with skill.

Owing to the Egyptian belief that a complete body was necessary for the happiness of a man in the next world, the custom of mummifying the body continued until the introduction of Christianity. At this time the Christian's faith in the resurrection tended to bring an end to the mummification of the dead.

The different materials used to preserve the body produced different results in the mummy. The employment of resin gave the skin a greenish color and rendered it like tanned leather. While such substance seems to have preserved the hair and teeth, it rendered the bodies easily breakable when freed from their wrappings. The use of bitumen to fill the abdominal cavity rendered the body black and hard, while natron caused the flesh to fall away from the bones.

In addition to the bodies of human beings the Egyptians mummified those of many animals, reptiles, and insects which were sacred to the gods.

Curiously enough, several centuries ago, the belief was common that the bitumen from mummies was a balm for cuts or bruises, and much of this material, called mummy, was sold for this purpose. Consult E. A. T. Wallis Budge, *The Mummy* (Cambridge, 1894); G. E. Smith, *A Contribution to the Study of Mummification in Egypt* (Cairo, 1906); C. W. Mead, "Peruvian Mummies and what they Teach," in *American Museum of Natural History, Guide Leaflet No. 24* (New York, 1907).

MUMMY CASE. In ancient Egyptian embalming, the case immediately surrounding the shrouded mummy. It was in the outlines of a human body and was made to fit the corpse. There were usually two mummy cases for each mummy. The inner one was plain, while the outer one was covered with paintings and hieroglyphs recounting the life and deeds of the dead. The material was usually cedar. The double case was enclosed in an oblong coffin, and this in its turn in a sarcophagus. See EGYPT, *Manners and Customs*; EMBALMING, SARCOPHAGUS.

MUMPS (from Dutch *moppen*, to cheat, from *mommen*, to mumble), EPIDEMIC PAROTIDITIS. A popular name of a specific inflamma-

tion of the parotid and rarely of the other salivary glands. It is an infectious, contagious disease, occurring as a rule in epidemics, although isolated cases are often seen. While it chiefly attacks children and adolescents, adults are not exempt.

The disorder usually begins with a feeling of stiffness about the jaws, which is followed by pains, heat, and swelling beneath the ear. The swelling begins in the parotid, but the other salivary glands may become involved, so that the swelling extends along the neck towards the chin. One or both sides may be affected, and, in general, the disease appears first on one side and then on the other. There is seldom much fever. The inflammation is usually at its highest point in three or four days, after which it begins to decline, suppuration of the glands scarcely ever occurring. In most cases no treatment further than due attention to the bowels and protection of the parts from cold by the application of flannel or of cotton is required, and the patient completely recovers in eight or ten days.

A singular circumstance connected with the disease is that in many cases the subsidence of the swelling is immediately followed, in patients past the age of puberty, by swelling and pain in the testes in the male sex and in the ovaries or mammae in the female. The inflammation in these glands is seldom very painful or long continued. More serious complications are metastasis into the internal ear (producing permanent deafness), meningitis, joint inflammations, and albuminuria.

MUN, mĕn, (ADRIEN) ALBERT (MARIE), COUNT DE (1841-1914). A French politician and author, leader of the Catholic Anti-Republican party. He was born at Lumigny, graduated at Saint-Cyr in 1862, and fought with distinction in the Franco-Prussian War and against the Commune. Count de Mun was the chief founder, in 1871, of the Circles of Catholic Workmen. He was a member of the Chamber of Deputies in 1876 and from 1881 till his death, except for an interval in 1893. Through his influence the power of the French clergy was thrown to the Boulangists. In 1892 he founded the league of the Sacré Cœur, and on the Pope's instructions promised to work with the Republic for reform if the government would give up its atheism. Count de Mun took a prominent part in the Dreyfus trial. In 1905 he was one of the ablest opponents in parliament of the bill for the separation of church and state. In 1913 he fought hard to have the three-year military law repealed, although he predicted that France would soon be at war with Germany. When war did break out the next year, he made a notably eloquent appeal to France to meet the crisis with courage. (See FRANCE.) He was elected to the French Academy in 1897. His published works, especially his speeches, for which he was famous, include: *Discours* (7 vols., 1888-1900); *Lettres adressées à M. Waldeck-Rousseau* (1900); *L'Organisation professionnelle* (1901); *Les congrégations religieuses devant la Chambre* (1903); *Contre la séparation* (1905); *L'Heure décisive* (1913).

MUN, THOMAS (1571-1641). An English merchant and economic writer, born in London. As a young man he was engaged in the Mediterranean trade and in 1615 was appointed member of the committee, or director, of the East India Company. In 1621 he published *A Dis-*

course of Trade, from England into the East Indies, in which he defended the East India Company against the charge that it drained England of bullion. His most important book, *England's Treasure by Foreign Trade*, was published after his death in 1664. This work is the ablest of the writings of the mercantilists, and exercised great influence over the economic and political thought of the time, effectually refuting the Bullionist view, that only such foreign trade as yielded a direct balance of bullion was advantageous to the realm.

MUNBY, ARTHUR JOSEPH (1828-1910). An English poet, born in Yorkshire. He graduated (1851) from Trinity College, Cambridge, and was called to the bar at Lincoln's Inn (1855). *Verses New and Old* (1865) contained "Doris," a lovely pastoral *Dorothy* (1880), a country story in elegiac verse, was very popular in England and the United States. Later appeared *Vulgar Verses* (1891), written in dialect; *Susan: A Poem of Degrees* (1893); *Poems* (1901), *Relics* (1909). Munby defended his realism in an appendix to *Dorothy*.

MUNCH, mupk, EDWARD (1863-). A Norwegian painter, born in Ljoten. He was educated in Christiania and Paris under Bonnat. His "Early Morning" (1883), which attracted much attention among artists, "The Sick Child" (1885), "Spring" (1889), his best work, and "The Day Thereafter" (all in Christiania Gallery) reveal Munch as an able colorist. "Ashes," "Youth," "The Death in the Room," "Loving Woman," "Kiss," "Shriek," "Vampire," aroused much opposition by their pessimism. Munch's exhibition in Berlin (1892) caused a stir. His landscapes, "Summer Night," "Stars," "White Night," and his portraits, especially of himself and his sister, are notable examples of his work. An exhibitor abroad as well as at home, Munch came to be considered one of Norway's most important painters.

MUNCH, PETER ANDREAS (1810-63). A Norwegian historian. He was born in Christiania and educated there at the university. He became professor of history in Christiania in 1841 and in 1861 was appointed historiographer and archivist of Norway. He maintained that three distinct dialects prevailed in the kingdoms of Norway, Sweden, and Denmark, and that the so-called Icelandic literature was really the production of ancient Norway. He held that the modern Icelanders keep one dialect, and the inhabitants of the Faroe Islands another, of the ancient Norwegian. He rejected the term "Icelandic," for which he substituted "Old Norse." Among his works are: *Norges gamle Love indtil 1837* (3 vols., 1846-49), in collaboration with Keyser, *Det gotiske Sprogs Formlære* (1848), *Historisk-geografisk Beskrivelse over Kongeriget Norge i Middelalderen* (1849); a *History of the Norwegian People* (*Det norske Folks Historie*) (8 vols., 1852-63), *Om den saakaldte nyere historiske Skole i Norge* (1853). He edited a number of Icelandic works. His essays were edited by Gustav Storm (Christiania, 1872-76; 2d ed., 1894).

MUNCHAUSEN, mün-chō'sen, BARON English for Münchhausen (q.v.).

MÜNCH-BELLINGHAUSEN, mupk-bél-ling-hou'zen, ELIGIUS FRANZ JOSEF, BARON VON (1806-71). An Austrian dramatist, known under the pseudonym Friedrich Halm. He was born at Cracow, studied jurisprudence, and held

a number of government offices in Austria. His first play, *Griseldis*, produced in 1834 (11th ed., 1896), was well received. It was followed by *Der Adept* (1836); *Camocens* (1837), *Imelda Lambertazzi* (1838), *Der Sohn der Wildnis* (1843; 10th ed., 1896), a conspicuous success on all the stages of Germany, and known on the American stage under the name of *Ingomar, the Barbarian*. In 1854 appeared *Der Fechter von Ravenna*, his greatest work, which was greeted with universal applause. Of all his subsequent efforts the romantic comedy *Wildfeuer* (1864; 7th ed., 1896) alone brought him a renewal of his earlier triumphs. He knew the stage and its requirements, but was not a great artist. His collected works were published in eight volumes in 1857-64. Consult: Pachler, "Die Jugend- und Lehrjahre Halms," in *Oesterreichisches Jahrbuch* (Vienna, 1877); Schachinger, *Briefwechsel zwischen Michael Enk von der Burg und Munch-Bellinghausen* (ib., 1890); *Allgemeine deutsche Biographie*, vol. xxii (Leipzig, 1885).

MÜNCHEN-GLADBACH, mün'ken-glat'-bäg A town in Prussia. See GLADBACH.

MÜNCHHAUSEN, mün'hou-zn, HIERONYMUS KARL FRIEDRICH, BARON (1720-97). An adventurous German noble, born on his father's estate, Bodenwerder, in Hanover, where he died. He served in the Russian cavalry against the Turks (1737-39) and told marvelous tales of his adventures. These were first gathered in English by Rudolph Erich Raspe (qv), a German exile (Oxford, 1785), as *Baron Munchhausen's Narrative of his Marvellous Travels and Campaigns in Russia*. G. A. Burger rendered this into German (1786), and in that language it gained universal popularity as a monument of methodical lying unparalleled in literature. Consult Karl Müller-Fraureuth, *Die deutschen Lügendichtungen bis auf Munchhausen* (Halle, 1881), which shows that some of Raspe's tales are borrowed from Behel's *Facetiae* (1508) and others from Lange's *Deliciae* (1765). Consult also Griesbach's introduction to a reprint of Burger's translation (Stuttgart, 1890) and F. Lienhard, *Munchhausens Lustspiel* (Leipzig, 1900).

MUNCIE, mün'si. A city and the county seat of Delaware Co., Ind., 54 miles northeast of Indianapolis, on the White River and on the Cleveland, Cincinnati, Chicago, and St. Louis, and Lake Erie and Western, the Chesapeake and Ohio of Indiana, the Fort Wayne, Cincinnati, and Louisville, the Pittsburgh, Cincinnati, Chicago, and St. Louis, and the Central Indiana railroads, being the terminus of the last mentioned, which has shops here (Map Indiana, G 4). Intercommunication among the various lines is furnished by a belt road encircling the city. It is connected with Indianapolis and other cities by five interurban roads. It is the seat of the Muncie Normal Institute, and has a large public library, courthouse, and hospital. The city is situated in the natural-gas belt of the State near deposits of coal—advantages that have contributed to its development as an important industrial centre, noted particularly for its extensive iron, steel, and automobile interests. There are also large glass and fruit-jar works, canneries, and manufactories of lawn mowers, silver and silver-plate goods, underwear and clothing, handles, caskets, wheels and carriage woodwork, gas engines and supplies, steam boilers, iron bedsteads, etc. Pop., 1900, 20,942; 1910, 24,005; 1914 (U. S. est.), 24,969.

MUNCK, münk, EBNEST DE (1840-1915). A Belgian violoncellist, born at Brussels. He studied under his father, François de Munck, also noted as a violoncellist, and under Servais, and at 15 toured Great Britain with Juillié's orchestra. He played in Paris in 1868-69, at Weimar in 1870, at Leipzig in 1872, and at Vienna in 1877-78. In 1879 he married Carlotta Patti, a sister of Adelina Patti, and herself a soprano singer of ability. With his wife he made concert tours in the United States, India, China, Australia, and Egypt. In 1893 he was appointed professor of music at the Royal Academy of Music, London.

MUN'DA. An ancient town of Hispania in the country of the Turdetani in modern Andalusia. It is noted for the victory gained here by Cæsar over the sons of Pompey in 45 B.C. The exact location of the town is, however, a matter of dispute.

MUN'DAS, or MUNDA-KOLS. The inhabitants of Chota Nagpur and one of the principal tribes of the Kolarian stock in northeastern Hindustan. They are also known as Hoto-Ju. The Mundas are short of stature and very dolichocephalic. Monogamy is the rule, and the position of the wife is higher than with many Oriental peoples. Some writers use Munda as a general term for Kolarian. See KOLARIAN PEOPLES.

MUNDAY, ANTHONY (1553-1633). An English poet, playwright, and compiler, born in London. In Rome he obtained material for *The Mirrour of Mutabilitie* (1579), a moralistic effort in verse, and after some experience on the English stage he wrote tracts against the Jesuits and other Roman Catholics, particularly Edmund Campion. Of 18 plays in which he had a hand only four are extant—*John a Lent* and *John a Cumber* (1595), *The Downfall of Robert Earle of Huntingdon* (1599), *The Death of Robert Earle of Huntingdon* (c. 1601), with Chettle, *The True and Honourable History of the Life of Sir John Oldcastle* (1600), with others. Munday also translated French romances, wrote many "pageants," such as *The Triumphs of the Golden Fleece* (1623), and verse, such as *A Banquet of Davitie Conceyts* (1588). For bibliography of this prolific, if second-rate, man of letters, consult *Dictionary of National Biography*, vol. xxxix (London, 1894).

MUNDE, mün'dä, PAUL FORTUNATUS (1846-1902). An American gynecologist, born in Dresden, Germany. He came to the United States with his father after the revolution of 1848-49, and in 1866 graduated at Harvard Medical School, after serving as medical cadet in the Federal army in 1864. Volunteering as assistant surgeon in the war between Prussia and Austria, he was from 1866 to 1870 assistant in the hospitals at Wurzburg, and in 1870-71 served as surgeon with the grade of first lieutenant in the Franco-Prussian War. Munde settled in New York City in 1872 as an obstetric specialist. In 1880 he became professor at Dartmouth Medical College, and in 1882 professor in the New York Polytechnic. He invented several gynecological instruments, edited the *American Journal of Obstetrics* (1874-92), and wrote *Minor Surgical Gynecology* (1880, 2d ed., 1885), *A Sketch of the Management of Pregnancy, Parturition, and the Puerperal State, etc.* (1887), *Diseases of Women* (1891).

MUNDELLA, ANTHONY JOHN (1825-97). An English statesman and philanthropist, born at Leicester of Italian-Welsh descent. At 11

he was employed by a hosiery manufacturer, at 23 he was on the way to success as partner in a hosiery firm in Nottingham. Politically he was a Radical, sympathized with Chartism (q.v.), and manifested a deep concern for the suffering poor. He was instrumental in forming at Nottingham the first British board of conciliation for the settlement of differences between employers and employed (1866). Elected to Parliament for Sheffield (1868), he directed his energies towards the improvement of laws regulating factories and education, and was particularly successful in the lightening of women's and children's labor. In 1880-85 he was vice president of the Council of Education under Gladstone, and he succeeded in passing a compulsory-education act (1881), while as President of the Board of Trade (1886 and 1892) he started a labor department of which the *Labor Gazette* was the organ. In 1894-95 he was chairman of an important committee on poor-law schools, and worked to prevent the undue isolation of pauper children while being educated. He resigned from Parliament in 1894, but was reelected the following year and died while in service.

MÜNDE, mün'den. A town in the Province of Hanover, Prussia, situated at the confluence of the Fulda and the Werra, 11 miles northeast of Cassel (Map Germany, C 3). It has a thirteenth-century Lutheran church, a Gymnasium, a royal school of forestry with a library of 9000 volumes, and a palace in which are relics of the faience industry which once flourished in Münden. The chief manufactures are confectionery, hats, rubber, lead, celluloid, art objects, sugar, boilers, chemicals, and cigars. In the vicinity are coal mines and nullstone quarries. Pop. 1900, 9236; 1910, 10,991.

MUNDEN, JOSEPH SHEPHERD (1758-1832). An English comedian, now noted especially for Charles Lamb's encomium, "On the Acting of Munden." Born in London, he began life in a commercial position, but he early found a place on the provincial stage, and in 1790 made his appearance in London. His ability to "make faces" was famous, and he was greatest in broad farce, though in serious parts he was not without success. Among his best characters were Sir Francis Gripe, Sir Peter Teazle, Old Dorn-ton, and Sir Robert Bramble. He retired in 1824, and died on Feb. 6, 1832, in London. Consult Charles Lamb, *The Essays of Elia* (1st series, London, 1823). *Memoirs of Joseph Shepherd Munden, Comedian*, by his son (ib., 1844). Laurence Hutton, in *Actors and Actresses of Great Britain and the United States*, edited by Matthews and Hutton (New York, 1886).

MUNDT, munt, KLARA. A German novelist, best known under her pseudonym Luise Mühlbach (q.v.).

MUNDT, THEODOR (1808-61). A German novelist and critic of the "young German" school, husband of Luise Mühlbach. In 1848 he became professor of history at Breslau and in 1850 professor and university librarian at Berlin. He became first known by his *Madonna, oder Gespräche mit einer Heiligen*, a memorial of Charlotte Stieglitz. Mundt edited, with Varnhagen von Ense, Knebel's letters and posthumous works, and also published Luther's *Politische Schriften*. He wrote books of travel and romantically historical novels: *Carmela* (1844); *Mendoza* (1847). *Die Matadore, etc.* (1850); and also *Geschichte der Weltliteratur, Ge-*

schichte der Litteratur der Gegenwart (1842); *Geschichte der Gesellschaft*; and a critical *Kunst der deutschen Prosa* (1837). Consult Otto Draeger, *Theodor Mundt und seine Beziehungen zum jungen Deutschland* (Marbach, 1909), and H. H. Houben, *Jungdeutscher Sturm und Drang* (Leipzig, 1911).

MUNDURUCU, mōō'n'dōō-rōō-kōō'. A powerful tribe of the great Tupian stock (q.v.), residing chiefly about the confluence of the Tapajós and Amazon in north-central Brazil. They are variously estimated at from 30,000 to 40,000. The men are tall, athletic, broad-chested, and of light complexion, and their naked bodies are entirely covered with artistic tattooing. The women are pleasing in manner, with a natural and unconscious vivacity. Both sexes are noted for their honesty. The men practice agriculture and do beautiful feather work. The women are skillful in weaving cotton fabrics and hammocks. Besides their habit of preserving the heads of their enemies, which has gained them the name of Paiguize (beheaders) among the surrounding tribes, they have the custom of killing persons hopelessly ill or decrepit.

MUNGER, mün'gēr, THEODORE THORNTON (1830-1910). An American Congregational clergyman, born at Bainbridge, N. Y. After graduating from Yale College in 1851 and from the Yale Divinity School in 1855, he was pastor at Dorchester, Mass., until 1860, then spent two years in travel and study, and had charges at Haverhill and Lawrence. While in California in 1875-76 he established a church at San José. Afterward he was pastor at North Adams, Mass., until 1885, and from then till his death was connected with the United Church at New Haven, Conn., as pastor (1885-1900) and pastor emeritus. Dr. Munger was influential in the reconstruction of religious thought necessitated by science and criticism. He published: *On the Threshold* (1880, revised and enlarged ed., 1908). *The Freedom of Faith* (1883). *The Appeal to Life* (1887); *Horace Bushnell, Preacher and Theologian* (1899); *Essays for the Day* (1904). Consult B. W. Bacon, *Theodore Thornton Munger, New England Minister* (New Haven, 1913).

MUNGHIR, mün-gēr'. A town of India. See MONGHYR.

MUN'GO. See SHODDY.

MUNGO, SAINT (†518-603). The popular name of St. Kentigern, one of the three great missionaries of the Christian faith in Scotland. St. Ninian (q.v.) converted the tribes of the south. St. Columba (q.v.) was the apostle of the west and the north; St. Kentigern was the apostle of the Strathclyde Britons, who held the country between the Clyde on the north and the farthest boundaries of Cumberland on the south. (See STRATHCLYDE.) He is said to have been the son of a British prince and princess and is believed to have been born at Culross on the Forth, near Perth, in 518. He planted a monastery on the site of Glasgow and became the Bishop of the Kingdom of Cumbria (q.v.). The nation would seem to have been only partially converted, and about 553 persecution drove St. Kentigern from the realm. He found refuge among the kindred people of Wales, and there, upon the banks of another Clyde, he founded another monastery and bishopric, which still bears the name of his disciple, St. Asaph. Recalled to Glasgow in 573 by King Roderick the Bountiful, Kentigern renewed his episcopal and

missionary labors, in which he was cheered by a visit from St. Columba. He died Jan. 13, 603, and was buried where the cathedral of Glasgow, called St. Mungo's, now stands. There is a fragment of a *Life* of St. Kentigern written in the twelfth century, and a longer *Life* by Jocelyn of Furness, written about 1180, printed with translation in Pinkerton, *Lives of the Scottish Saints* (Paisley, 1889-95). Consult A. P. Forbes, in *The Historians of Scotland*, vol. v (Edinburgh, 1875).

MUNGO BEAN. See BEAN.

MUN'GOOS. One of the various spellings of mongoose (q.v.).

MUNG TSE. See MENCIOUS.

MUN'HALL. A borough in Allegheny Co., Pa., on the Pennsylvania Railroad (Map: Pittsburgh, J 8). It contains a Carnegie library. The manufacture of steel products constitutes the borough's sole industry. Pop., 1910, 5185.

MUNICH, mū'nĭk (Ger. *München*). The capital of Bavaria and the third largest city in Germany, situated at an elevation of 1700 feet, mostly on the left bank of the Isar, on the south border of a partly swampy and partly fertile forested plateau, 296 miles by rail south of Leipzig (Map: Germany, D 4); lat. 48° 9' N., long. 11° 35' E. The city is only about 25 miles north of the Bavarian Alps and is subject to a somewhat raw climate characterized by abrupt changes of temperature, which are at times trying. Mean annual temperature, 46° F.

Munich is comparatively modern. It is progressive and handsomely equipped with the latest municipal improvements, having, in fact, been mostly built since about 1830. It owes its artistic and regal appearance to the art-loving Louis I and his successors. The very wide avenues and the many buildings constructed in all the leading styles of architecture lend great dignity to the metropolis. The streets are generally regular, and the city is lavishly adorned by numerous squares and pleasure parks and gardens. The largest park is the beautiful English Garden. It contains over 500 acres, watered by branches of the Isar and adorned with small temples, towers, etc., and was laid out by Count Rumford (q.v.), a native of Massachusetts, who lived in Munich from 1784 to 1799, and whose monument stands on the Promenadenplatz.

The old section of Munich, especially around the old canal and arms of the Isar, is very picturesque, with narrow streets and old houses. Improvements were made about 1800, 1830, and 1888. To the first period belong the Sonnenstrasse, Karlsplatz, Maximiliansplatz, Promenadenplatz, etc.—streets which follow the old wall from the Sendlinger Gate, past the Karls Gate, to the Ludwigstrasse. The Ludwigstrasse, laid out in 1830, stretches from the Hall of Generals, an open loggia with statues of General Tilly and Prince Wrede, crossing the Odeons Platz with a statue of King Louis I, to the Gate of Victory, flanked with impressive Renaissance edifices (Library, Ludwigskirche, University, etc.), continuing as Leopoldstrasse to the suburb Schwabing. Other streets of this period are the Brienerstrasse from the gate of the court gardens, crossing the Karolinenplatz with the Obelisk, the Königsplatz with the exhibition building, the Glyptothek, and Propylæa, to the Stiglmayerplatz; and the Maximilianstrasse, running from the Max Joseph-Platz to the Isar, crossing the river on the Maximilian

Bridge, and leading up to Maximilianeum; this street is lined by state and public buildings and ends in the Am Gasteig Park. The Am Gasteig Park and Maximilian Park border the Isar on the east side and contain the Friedensdenkmal in memory of the Peace of 1871 after the Franco-German War. To the Maximilian Park leads the Prinz-Regentenstrasse, belonging to the third period, running on the south side of the English Garden and crossing the Isar on the Luitpold Bridge. Eight bridges span the Isar.

The Max Joseph-Platz, together with the Marienplatz, represents the centre of life in Munich. The former connects the old and new sections and is embellished by Rauch's huge bronze statue of King Max Joseph. The Alte Residenz, one of the three parts of the royal palace, extends here along the Residenzstrasse with its open arcades and frescoes, especially the Italian landscapes by Rottmann. This structure was erected from 1598 to 1616 and contains four courts, but is of little architectural worth. Its apartments, however, are a source of great interest to sightseers, being luxuriously furnished in the seventeenth-century style and rich in historical associations. The royal chapel and the treasury possess numerous objects of intrinsic and historical value.

The other two parts of the palace are the fine Festsaalbau and the Königsbau. The latter, finished in 1835, and fashioned after the Pitti Palace, is notable for its splendid Nibelungen frescoes by Schnorr (1831). The former is a handsome edifice, completed 1842 in late Italian Renaissance style. It is enriched with Ionic pillars and with allegorical figures of the Bavarian provinces. Several apartments contain Hiltensperger's frescoes from the *Odyssey*. Beautiful salons are also the throne room, with striking bronze statue by Schwanthaler; the Rudolf von Hapsburg Hall, with paintings; the Barbarossa Hall, with reliefs by Schwanthaler. The Hall of Charlemagne, containing ambitious decorations descriptive of scenes from the Emperor's life; the "rich" rooms and chapel, the Pope's room (occupied in 1728 by Pius VI). But the best known of these apartments are those containing Stieler's 36 portraits of beautiful women, painted from various types of Bavaria's fairest womanhood.

Connected with these royal edifices are the great Hof und National Theater dating from 1823, with an attractive portico borne by Corinthian columns, and containing seats for 1800 persons, and the artistic and impressive court chapel, a structure dating from 1837, in the Byzantine Romanesque, and having sumptuous decorations. Adjacent also are a valuable ethnographical museum, an Art Union, with works of living artists, an instructive museum of plaster casts, and the museums of the Bavarian army in high Italian Renaissance. Other palaces in the city are the Old Castle or Ludwigsburg, the oldest palace of the Bavarian dukes, dating from 1253, the palace of the Archbishop, palace of Prince Charles, the palace of Prince Luitpold, the palace of Duke Max, with good decorations, and the royal Wittelsbach palace, begun in 1843.

Munich has no churches of great fame. The Ludwigskirche (by Gärtner, 1829-44) is a rather attractive example of Italian Renaissance, and contains a noteworthy "Last Judgment" by Cornelius. The St. Boniface basilica by Hübner

MUNICH

LUDWIGSTRASSE, LOOKING TOWARDS GATE OF VICTORY (UPPER)
CENTRAL SECTION OF THE CITY, WITH THE NEW CITY HALL AND THE FRAUENKIRCHE (LOWER)

(1850), with some threescore gray-marble columns, is also worthy of mention, as are the Gothic Marienhilfkirche (1831-39) and Giesinger Church (1865-84), the Romanesque St Annakirche (1892-94), and the St. Paulskirche (1895-1902). All these are modern churches. Of old churches may be mentioned the cathedral or Frauenkirche (1468-88), with two unfinished towers, the token of Munich, and the monument of the Emperor Louis (1314-47); the St. Peter'skirche (1181), the oldest church of Munich; the St. Michael Hofkirche (1583-97), a fine Renaissance edifice, with the monument of Eugène Beauharnais by Thorvaldsen; and the Theatinerhofkirche (1663-75), Italian Baroque, with the mausoleum of the royal family. Of the four Protestant churches the Mathäuskirche, on the Sonnenstrasse, is the oldest, and near the Isar the St. Lukaskirche (finished 1897), Gothic-Romanesque. The synagogue (1883-85) is one of the largest and finest in Germany. Among the impressive secular buildings are the early Renaissance Mint; the Government Building; House of Parliament; War Office; Post Office, Palace of Justice, the Old Rathaus (1313-27); the Gothic New Rathaus, one of the finest and largest modern European municipal buildings, completed in 1906; the Martinus Hospital and the Red Cross Hospital, the Savings Bank, etc.

The picture and sculpture collections of Munich are famous. The building of the Old Pinakothek, situated in the northern section of the city, not far from the royal palace, was constructed in 1826-36, in the Renaissance style. It is about 174 yards long, and is embellished on the exterior by statues by Schwanthaler. It contains about 1400 canvases. Almost all the great masters of painting since Raphael's time are represented here by works of the highest excellence. The greatest gems perhaps are Durer's Sts Peter, John, Paul, and Mark (the 'Four Temperaments') and his self portrait, several portraits and other pictures by Rubens, including the "Battle of the Amazons," the "Massacre of the Innocents," and the "Lion Hunt"; Perugino's "Virgin and St Bernard"; Raphael's "Madonna Temp'i," and Murillo's "Two Beggar Boys Eating Fruit." The Old Pinakothek contains in addition valuable cabinets of vases; also engravings and drawings. Its loggia are decorated by Cornelius. Adjacent on the north is the New Pinakothek, with external frescoes by Kaulbach (q.v.), and with a good collection of modern artists, mostly Bavarian. There are about 1000 paintings, and many fine bronzes and terra cottas principally from Rome and Greece. In the vicinity is also the Glyptothek, containing mainly a collection of ancient statuary; a fine Ionic edifice by Von Klenze. It has Assyrian and Egyptian departments, as well as departments devoted to excellent Greek and Roman examples and to incunabula. The highly prized collection of marbles from the island of Aegina is also in the Glyptothek. Its most valuable sculpture perhaps is the Greek Barberini Faun (300 B.C.). Among the modern statuary are many originals, as well as copies from good artists, and choice works of Canova, Thorvaldsen, Dannecker, and others.

In connection with the realm of art in Munich may be mentioned the Kunstgewerbehaus; also the Academy of Art, an ambitious edifice in Italian Renaissance style, completed in 1885, a school which has produced many well-known

artists. The artists of Munich maintain in the so-called Exhibition Building (finished in 1845) a permanent exhibition of their paintings exposed for sale. In the Crystal Palace (finished in 1854) are held the annual exhibitions of art, especially statues and paintings. The Club of Artists (finished in 1900) is celebrated for its interior decorations. The Bavarian National Museum, founded in 1855 and housed in a fine edifice, is of great value. Among its numerous collections covering many departments of human endeavor, the most valuable perhaps are the art works of the mediæval, Renaissance, and modern periods. The German Museum (1906-15), on the Museum Island in the Isar, contains a collection of originals and models illustrating the development of technical subjects and of natural sciences. On the same island is also to be found the Alpine Museum. The Schwanthaler Museum contains models of the master's works. A noteworthy picture collection also is the Schack Gallery, possessing choice originals and interesting copies of the great masters by many of Germany's foremost modern painters. Other museums are the collection of pictures and drawings left by the painter Kaulbach and the Lotzbeck Museum of pictures and marbles.

Munich is celebrated also as a musical centre, especially for German operas. The National Theatre is one of the most important of modern operatic institutions, being intimately identified with the Wagner influence and tradition. The theatre is well represented by about seven houses, besides the Court Theatre, among them being the Residence Theatre, the German Theatre, the Prince Regent Theatre, and the Gartner Place Theatre.

Among the many monuments not already mentioned are those of the Emperor Louis the Bavarian, Louis I, Schiller, Goethe, Wagner, Gluck, Schelling, Fraunhofer, Gartner, Klenze, Ohm, and Pettenkofer, the large and striking monument to Maximilian II, dating from 1875; the fine statue of Elector Maximilian I, after plans by Thorvaldsen; an obelisk on the Königsplatz made of the metal of captured cannon, and erected to the memory of the 30,000 Bavarian soldiers who died in the Napoleonic war with Russia in 1812; the fine monument to Læbig, the chemist; the Mariensäule on the Marienplatz, erected by Maximilian I in 1638 in memory of the victory on the White Mountain (1620); near to the column the bronze Fischbrunnen, associated with the Butchers' Festivals; the new and splendid Wittelsbach fountain; the Nornenbrunnen. The Siegestor (gate of victory), constructed in 1843 in honor of the Bavarian army, is a splendid arch patterned after that of Constantine at Rome. It is surmounted by a huge figure of Bavaria, riding in a chariot drawn by four lions. On the Königsplatz, near the Glyptothek, rises the Propylæa, an attractive portal completed with Doric and Ionic features in 1862—a tribute to the cause of Greek independence. Notable also is the ancient Isartor, with elaborate frescoes. Still other objects worthy of visit in Munich are the bronze foundry and the Royal Arsenal, with an interesting military museum containing relics of the Napoleonic wars.

At the head of the educational institutions is the celebrated university. (See MUNICH, University of.) The city's educational system is scarcely surpassed either for comprehensive-

ness or for excellence. The Maximilianeum, on the right bank, is an institution founded by Maximilian II for advanced civil-service instruction. It is surrounded by attractive pleasure grounds extending along the river shore. The important Polytechnic School (1865-68) is in a fine modern edifice in Italian Renaissance, and had, in 1914, 65 teachers and 2790 students, divided into five departments—engineering, construction, mechanical, chemico-technical, and agricultural. Near by is an art industrial school. There are also in the city a military academy and a military school, an academy of science with noteworthy collections, and numerous organizations for the development of all the chief branches of knowledge and its application.

Of the many valuable libraries, the Royal Library is by far the most important. Its spacious Florentine building was constructed after 1832, and possesses a magnificent staircase. The library is one of the largest in the world. It contains some 1,100,000 volumes and over 50,000 manuscripts. It is especially rich in German documents and scholastic literature, possessing some of the rarest of literary editions and other specimens, including a translation of Boccaccio, a codex aureus (in gold letters and dating before 900), and four books of Gospels. In this library, also, are the archives of Bavaria—a collection of 500,000 documents. The city has a botanic garden.

Industrially, Munich is important and prosperous. Its iron, bronze, and bell foundries, its lithograph and engraving establishments, its optical and mechanical instrument factories, are celebrated, as are its enormous breweries (some 45 in number), which have made the city famous for excellent beer. The large, palatial brewhouses and, during summer, the celebrated "cellars," or beer gardens, in the suburbs, are features of the city's social life. Well known are the Hofbräuhäuser on the Platz in old Munich, the Löwenbraukeller, and the Augustinerkeller. The other manufactures comprise cotton, wool, and damask goods, wax cloth, leather, paper hangings, carriages, pianos, gold and silver articles, machinery, steel wares, etc. In its manufacturing and commercial interests the city has made great strides. Beer is the chief export. Grain, hops, coal, wool, furniture, carpets, and art goods also are exported. Munich has a network of canals over 100 miles in length. Numerous important industrial and commercial unions and associations are established here.

Munich is the seat of all the important government institutions of Bavaria. It is administered by 2 burgomasters, about 40 magistrates, and some 70 councilmen. The annual budget balances at approximately \$4,500,000. The municipal debt is about \$40,000,000, offset by nearly twice that amount invested in public property, mostly in buildings and grounds. Over a third of the taxes goes to the service and reduction of the debt. The charitable institutions are excellent.

The popular festivals and *dults* (fairs) are a feature of Munich. They are all elaborate and interesting—e.g., the annual carnival, the Magdalen Festival in July, and the October Festival. The last is a kind of agricultural fair which attracts the picturesque country population. The environs are of interest. Their unique attraction is the famous "Bavaria," an immense bronze statue by Von Klenze rising on

a low elevation west of the city. It is a hollow female figure 94 feet high, cast from the bronze of foreign cannon, according to designs by Schwanthaler. It was unveiled in 1850. From its head there is a good view of the city. The adjacent Hall of Fame is a Greek colonnade dating from 1858. It holds about 100 busts of famous Bavarians, including Jean Paul and Schelling. The Nymphenburg is a royal château near the city. Its grounds are very attractive. The cemeteries of Munich are said to contain the most artistic tombs in the Empire. The population of the city has more than doubled in the last few decades. In 1800 it was 40,000, in 1871, 169,963, in 1900, 499,959, in 1910, 596,467; in 1915, about 630,000, mostly Roman Catholics. The death rate fell from 30.4 to 20.5 per 1000 from 1871 to 1904.

History. The history of Munich may be said to date from the time of Henry the Lion, who made it the centre of the salt trade in 1158. It grew rapidly under the house of Wittelsbach, which made it its capital city. The city was fortified in 1254. Otto the Illustrious having established his residence here. In the first half of the fourteenth century the library was founded. About the middle of the sixteenth century the art collections were begun. Munich became a royal residence in 1806. From the reign of Louis I dates the city's present magnificence.

MUNICH, UNIVERSITY OF. One of the leading German universities, founded by Duke Ludwig of Bavaria with the approval of Pope Pius II as a Studium Generale at Ingolstadt. The members of the faculties took an oath of loyalty to the see of Rome. Though the bull authorizing the opening of the institution was issued in 1458, it was not opened until 1472. True to its pledge, Ingolstadt University remained faithful to the Church of Rome during the trying period of the Reformation, the famous Dr. Eck being a member of it at that period. In 1556 the Jesuits gained control of the university and conducted it until their suppression in 1773, though Eckstatt labored from 1746 to remove them. At the instance of Ludwig Maximilian, whose name the institution now bears, it was moved in 1800 to Landshut, where it remained until 1826, when it was transferred to Munich and reorganized. In addition to the collections and institutes brought thither from Landshut, the government transferred to the university the botanical garden, anatomical theatre, observatory, and antiquarium, and a valuable collection of coins. In 1913 the university consisted of the faculties of theology, law, political science, medicine, and philosophy, with a total attendance of 7718 students. The university also includes a number of seminars, clinics, museums, a botanical garden, and an observatory. The university library contains over 600,000 volumes, about 3000 incunabula, and about 2500 manuscripts. The Collegium Geor-

gianum, founded in 1494 for the education of Catholic priests, and the Maximilianeum, founded in 1852 and opened in 1876, for the education of talented Bavarian youth, are affiliated with the university. The income of the university is about \$250,000 a year, the greater share being contributed by the government.

MUNICIPAL (mū-nis'pal) **ARCHITECTURE** (Lat. *municipalis*, from *municipes*, citizen, from *munus*, duty + *cupere*, to take). That branch of civil architecture which has to do with buildings erected out of public funds for the use and amusement of the inhabitants of a city or purely for the adornment of the city itself. The term is sometimes extended to include buildings for public business or amusement erected by private capital, such as exchanges, railway stations, and theatres. It is thus related on the one hand to the important concerns of civic administration and improvement, and on the other to those of architectural art. Its greatest development has been in modern times, coincidently with the progress in ideals of public policy and of democracy. It is doubtful if municipal buildings, properly speaking, existed in the prehistoric and the ancient Oriental worlds, the temple and royal palace filled all needs in these civilizations. The great city gates of ancient Babylonia and Assyria were the only structures in the Orient that could be included under the title of municipal buildings. See GATEWAY.

Greece. With the development of Greek city life after the seventh century B.C. several classes of such buildings were erected. Among these may be named the *Theatre* (qv), which was always erected with public funds, and which first began early in the fifth century B.C. to be built of stone and in the form and style recognized in the ruins of those at Epidaurus, Athens, Sicyon, etc. The *Stadium* (qv) and the *Hippodrome* (qv), for the different kinds of races, gave little opportunity for much distinctive architecture. The *Gymnasium* and *Palæstra* were devoted to contests requiring less space and to training and practice, and embodied features developed later by the Romans in the Imperial *thermæ*. Those at Ephesus and Alexandria-Troas are especially well preserved. The commercial centre of the city was the market place, or *agora*, corresponding to the Roman Forum (qv.), an open rectangular space bordered by colonnades and halls and decorated with monumental entrances, statuary, and fountains. The various halls for the transaction of municipal business, such as the *Prytæneum* and the *Bouleuterion*, were often connected with the market place, and there were frequently two *agoræ* in each city—the political and the commercial. Those at Priene, Assos, and other cities of Asia Minor are particularly important, as no well-preserved examples have been found in Greece itself. The so-called *ieschar* were public halls for banquets and other reunions and celebrations. Of the highest importance were the *propylæa*, or city gates, of which the most famous are those of the Acropolis at Athens and of Eleusis and Priene. To the list of Greek municipal buildings should be added the *stoa*, or open colonnades, and such decorative and memorial structures as the choragic monument of Lysicrates and the Tower of the Winds at Athens, public fountains, and the like. See PROPYLEA, STOA.

Rome. The Romans developed municipal

architecture even further in magnificence and variety after the second century B.C. Their theatres were more important structurally and richer in decoration, their amphitheatres were a new form altogether; their circus was architecturally more significant than the stadium and hippodrome. The Roman Forum, which was at first an irregular square without architectural beauty, was later bordered by basilicas, great halls for commercial and judicial purposes, while memorial and triumphal arches were placed at its entrances and along its main road. In the early days of the Empire a new type of city was developed, in which the various main groups of public buildings were united and harmonized by vast stretches of porticoes. Such porticoes in Rome itself were the Porticus Maxima, extending to the Tiber, and the mile-long Porticus Triumphalis in the Field of Mars. In the cities of Syria and the rest of western Asia a great era of rebuilding set in, the old blank-walled main streets being replaced by colonnaded avenues decorated with statues and intersecting at right angles. This type, which originated at Antioch, can now best be studied at Palmyra, Gerasa, and other cities near the coast line.

The many new Roman colonies and municipalities in north Africa and Syria gave even more occasion than the old cities for the carrying out of a regular plan of municipal architecture. The cities of Theveste and Timgad are important examples. The Pompeian Forum with its well-preserved basilica, its curiæ or municipal meeting halls with their colonnades, its Temple of Jupiter flanked by memorial arches, its Pantheon with the money changers' shops, its market hall, Temple of Venus, lounging gallery, and other well-grouped structures, shows how the government of a provincial town of moderate size grouped the public buildings around its main square.

Of the theatres, those at Aspendos in Asia Minor and Orange in France are the best preserved. Of the amphitheatres, those of Rome (the Coliseum), Verona, Capua, Arles, Nîmes, and Thysdrus, of the basilicas, those of Maxentius in Rome, of Pompeii, and of Treves.

With the decline of Roman power and the transfer of the capital to Byzantium the focus of activity in municipal architecture was shifted and Constantinople, or New Rome, became the scene of an extraordinary work of reconstruction under Constantine, Theodosius, and (later) Justinian. Meanwhile, until the final overthrow of the older capital, public buildings, porticoes, and basilicas were still being erected in Rome, and the majestic ruins of the Basilica of Maxentius and Constantine attest the importance of these expiring efforts of Roman art.

Middle Ages. The growth of municipal architecture in the Middle Ages was very gradual and depended largely upon the character of city government. In the monastic and feudal cities there were no works of municipal architecture of any importance. Conditions were more favorable to the erection of municipal buildings in the free communes and episcopal cities, which possessed complete or partial autonomy.

The most important municipal buildings were the hôtel de ville in France, the Rathaus in Germany, and the palazzo pubblico or comunale in Italy. The cities of northern and central Italy, of northern France and the Netherlands,

of northern Germany (especially the Hanseatic League), were most conspicuous for such buildings during the Romanesque and Gothic periods. The plan of the communal palaces varied according to whether the local constitution provided for meetings of a large body of citizens or only of a select few inside the building. The Doge's Palace in Venice had halls for the Gran Consiglio and others for the Council of Ten and the smaller council. At the more democratic Padua the immense hall with its wagon roof—the largest in Europe—provided for larger meetings. At Udine and Piacenza are the best examples of a whole lower story open in vaulted arcades for the popular meetings, with halls on the second floor for the smaller committees. These palaces in Lombardy were usually termed *broletti* (Como, Bergamo, Cremona, Monza, etc.). The main meeting room on the second floor was nearly always provided with a balcony or *ringhiera*, from which announcements were made to the people.

The cities of Tuscany and Umbria, later in achieving independence (except Pisa), erected, however, even more magnificent public palaces than their northern neighbors. The Palazzo Vecchio and Bargello in Florence, the Palazzo Pubblico at Siena and Perugia, built during the Gothic period (1250–1350), are the largest in Italy and especially remarkable for magnificent towers. Hardly a city in Italy, even one enjoying but a modicum of administrative autonomy, but had a public palace of some sort, and in some cities there were two palaces, the episcopal and the civil.

Such communal palaces were much rarer in feudal France; they are almost wholly wanting in the southern and central provinces. But the powerful cities of the Netherlands—Lille, Louvain, Mechlin, Brussels, Ghent, Bruges, Ypres, Arras, and Liège—built as magnificent public palaces as their Tuscan compeers. That of Brussels, with its great central tower, is a fine example in the developed Gothic style; that of Louvain presses it closely in magnificence. Germany is particularly rich in such buildings, not on so large a scale, certainly, but interesting from their very number. In France the *hôtels de ville* of St. Antonin (thirteenth century) and of Compiègne (fifteenth century) are among the few mediæval buildings of this class. Municipal belfries (see BELFRY), or *campanili*, were prominent in many cities of both northern Europe and Italy. The *palais de justice* of France were important civic monuments, as those of Paris and Rouen, the *Prévôté* at Poitiers, etc.

The communal organization in the cities was usually based upon the association of the labor and trade guilds. It was the officers of these guilds who, coming together for mutual benefit, originated in most cases the city administration and constitution. Many of these guilds had separate buildings for their meetings and they usually repeated on a smaller scale the architectural features of the communal palaces. The Loggia dei Mercanti at Bologna, those at Ancona and Perugia, the Or San Michele at Florence, are a few among many. The lawyers' guild sometimes built sumptuously, as in the Palazzo dei Giureconsulti at Cremona. In the case of some of the very powerful Flemish guilds, such as the cloth guild, their buildings equaled or surpassed the average town hall: this was the case at Ypres (recently destroyed). In some cases the governing body had a palace

separate from that where the popular meetings were held. Thus, at Pistoia there was a Palazzo del Comune and also a Palazzo del Podestà. Other associations besides the guilds erected common halls—the religious fraternities, such as that which built the Bigallo in Florence or the various beautiful *scuole* in Venice. Hospitals like those of Ourscamp and Beaune in France, the Hospital at Milan, and the Misericordia at Arezzo, are distinctly public monuments.

The most important of the minor works of municipal architecture were the bridges, fountains, and gates. The first two classes have been treated under their separate heads, so that it will be necessary to describe only the city gates. During the Middle Ages the fortification of cities by heavy walls was a universal custom and the gates were fully as important as the triumphal arches and gateways of Roman cities. The great gates at Lubeck, Frankfort, and Freiburg, and several gates at Florence, show the German and Italian styles. They were usually dedicated to a saint and contained a shrine and frescoes or carved images in the central opening; guardrooms on the sides and above contributed to making the gate a monumental structure. The round or pointed single archway was often flanked by two towers, as in the Porta della Vacca at Genoa.

In so far as the general arrangement of the larger mediæval cities is concerned, the cathedral square was the main centre of the city, the market place, and a place of resort; but wherever there was also a strong municipal civic organization there was also a second square dominated by one or more city buildings and kept free for public assemblies. Seldom do we find a single square used for both classes of buildings.

Mohammedan. There was far more of municipal architecture in the mediæval Mohammedan cities of the Orient than Europeans realize. The bazars with their long covered galleries rivaled the gallery arcades of modern cities; the khans and caravanserais with their immense courts were often on a colossal scale. Numberless sebils or fountains were dotted through the streets. The city gates were monumental. The alcazars were an interesting combination of governmental palace and fortress. There were numerous hospitals and colleges with attached mosques and mausoleums, as at Ispahan. Few European cities showed so ample a display as Bagdad, Cairo, Damascus, Adrianople, Constantinople, or even the mediæval cities of second rank, like Fez, Kairwan, Emesa, and a hundred more. The Mohammedan engineers in western Asia were famous for their bridges, fortifications, and castles. The great wealth and advanced culture of the Arabs, Moors, and Persians, and of the Moslem Hindus—far superior to that of the West in the Middle Ages—made it easy to build up beautiful cities, now all reduced to squalor and ruin.

Renaissance. While the Renaissance was more fruitful in works of private and religious architecture than in municipal architecture, a great number of notable buildings were erected for public purposes in the cities of Italy and of western Europe. The general downfall of civic liberties checked the progress of some phases of municipal architecture, but the change of style ushered in by the Renaissance led to the erection of many new edifices in the more modern

style. Thus, in Italy the elegant town hall at Verona (Palazzo del Consiglio), by Fra Giocondo (1470), the town hall at Padua, the Loggia del Papa at Siena, the Procuratie Vecchie at Venice, belong to the fifteenth century; to the sixteenth, the Library of St. Mark and the Loggetta of the Campanile (demolished by the fall of the tower, 1902, but since rebuilt) at Venice, the magnificent arcade surrounding the ancient Basilica at Vicenza, by Palladio, and many loggias and administrative palaces in other cities. The Hôtel de Ville at Paris (1546), the town halls of Rheims, Rouen, and other French cities, and even of small towns like Beaugency, erected in the sixteenth century, the great town halls of Antwerp and of several Dutch cities, and the picturesque Rathäuser, or council halls, of Bremen, Nuremberg, Altenburg, Cologne, and other German cities, prove that there was still opportunity for effective and beautiful municipal buildings. Fountains were also multiplied, often of great elaboration and sculptural splendor. (See FOUNTAIN.) In the seventeenth and early eighteenth centuries there developed a remarkable movement for the embellishment of cities by the decorative treatment of open squares and spaces. Of this movement the piazza in front of St. Peter's, with its colonnades, obelisk, and fountain, and the Piazza del Popolo, both at Rome, and the Place de la Concorde and Place Vendôme at Paris, are the finest examples. It was in the eighteenth century that a new era of municipal architecture commenced in Germany with the transformation of Berlin under Frederick the Great, followed by that of Munich in the first half of the nineteenth century, and then by that of Vienna, and that of Paris by Baron Haussmann under Napoleon III. New classes of buildings were developed and erected—museums, picture and sculpture galleries, halls of fame, theatres, and public educational buildings. Every style of architecture was employed, but mainly the neo-classic and neo-Renaissance. The triumphal arch again came into vogue. Great boulevards became the fashion. The old-fashioned narrow streets were discredited, even in Italy. The sun was let in everywhere. The increasing volume of transportation compelled the multiplying of bridges, the rectification of the street plan, and the construction of railway tunnels, cuttings, and viaducts, the building of docks and terminals, and many other like improvements.

Recent Development.—Europe. Of the more recent development of municipal architecture Paris, Vienna, and Budapest stand out as the most conspicuous examples; but Berlin, Munich, and other German cities, Rome and Naples, and in less degree many other cities in Europe, have undergone a process of architectural remodeling. The great operations undertaken by Napoleon III in Paris under Haussmann's direction included not only the reform of the city's street plan, but also the erection of many public buildings. This work, interrupted by the fall of the Empire, was resumed under the Republic, and has been steadily prosecuted ever since, at the joint expense of the city and state. The new Opera House, the reconstructed Palais de Justice, the Tribunal de Commerce, the completed and remodeled Louvre, the St. Michel Fountain, and since the War of 1870-71 the new Hôtel de Ville, Sorbonne (university), and Ecole de Médecine, the demolition of the ruined

Tuileries and creation of new gardens on its site, the two new art palaces, and the Alexander III and other bridges, are the monuments of this remarkable activity. So the Reichstagsgebäude (parliament house), the Museum, the various columns of victory and other monuments, and the Sieges-Allee, at Berlin, the squares and modern public buildings of Munich, the town hall and new railway terminal at Hamburg, the town hall at Leipzig, and many other examples indicate the tendencies of German taste in municipal buildings and embellishments. Germany at present leads the world in city planning, whatever be thought of the artistic quality of many of her municipal buildings; while in Austria-Hungary the marvelous rebuilding of the central portion of Vienna and the more recent architectural enterprises in Budapest are equaled only by the transformation of Paris under Napoleon III. While the architectural treatment of the Viennese public buildings (the Gothic town hall, the classic parliament house, the Renaissance university, museums, art institute, the Hoftheater, etc.) leaves something to be desired, the general effect is highly impressive by its stateliness and grandeur of disposition along a single splendid street, the Ringstrasse. In Great Britain nearly every important city has in recent years either rebuilt portions of its more overcrowded districts on improved plans, or erected new town halls, exchanges, public baths, schools, and museums; and the English architects have developed in these public works an architectural style of considerable interest and character, quite different from the modified French Renaissance style which has more generally prevailed elsewhere. Italy, though backward in many respects in this field of architecture, has not only remodeled some of the worst-crowded districts of Naples and Rome, but has embellished many of her cities with public buildings in modern style, established new parks and public gardens, and in some cases completed the unfinished façades of ancient buildings—notably that of the cathedral of Florence (1883-89). The embanking of the Tiber (1879-1900) in Rome, the construction of new bridges, the building of arcades or glass-roofed streets of monumental design, flanked by attractive shops (as at Milan, Naples, etc.), and the erection of railway termini sometimes of considerable architectural splendor, are further evidences of municipal activity.

United States. While the first 50 years of independent national existence witnessed the erection of many noteworthy Federal and municipal buildings, especially customhouses and State capitols, these were often indifferently placed, with no adequate approach or surroundings. The public buildings of American cities—town halls, railway stations, schools, court-houses, and administrative offices—were for the most part commonplace, or pretentious and ugly. Only rarely, as at Washington, New York, Savannah, and Charleston, was there until recent years even the semblance of any recognition of the art of municipal planning or of the importance of artistic treatment alike in the design and setting of public buildings. The rectangular street plan was universally accepted as the ideal arrangement. Of late, with the general awakening of the art instinct in the United States, stimulated by the object lessons afforded by several great expositions (Chicago, Omaha, Buffalo, St. Louis) and by congresses and con-

ventions of architects and civic reformers, there has begun a widespread reform in municipal architecture, of which the commission plan for the improvement of Washington, the adoption of the group system for the public buildings of Cleveland, Ohio, the new park system of Boston, and the proposed remodeling of the Chicago lake front, are a few out of many evidences. Recent town halls, exchanges, public libraries, courthouses, and railway stations in the United States are excellent structures architecturally. Particularly noticeable are new public libraries at New York, Detroit, St. Louis, and Springfield (Mass.), the new municipal group of this last-named city, the city hall at Los Angeles (Cal.), and the superb new municipal offices at New York, the colossal railway termini of New York and its great bridges across the East River, its new docks and ferry terminals, and an impressive number of courthouses, custom-houses, terminals, squares, bridges, monuments, school buildings, municipal hospitals, and the like in nearly all the larger and some of the smaller cities, which give promise that the ugliness of American cities is to be greatly mitigated if not done away with in the near future. See TOWN HALL, and Plates of PHILADELPHIA.

MUNICIPAL ART SOCIETIES. Societies in the United States which take their name from the purpose of their organization, which is the promotion of municipal art, i.e., art as applied to cities. They seek in a general way to beautify cities. Among the means advocated to this end are the planning of cities with regard to artistic beauty as well as to the needs of traffic, the planting of streets with trees and the restriction of billboard advertising; the increase in the number and size of parks, especially in the congested districts; worthy sites and beautiful architecture for public buildings, and their decoration with statuary and mural painting; the embellishment of the city with statues, monuments, and other works of art—things which have long been esteemed essential in European cities. In the United States these ideals are promoted by local societies, like the municipal art societies of New York, Chicago, Baltimore, Cincinnati, and other cities, the Fairmount Park Association of Philadelphia, and the American Park and Outdoor Association. Among the achievements of the movement have been the official appointment of municipal art commissions, composed principally of artists, by New York, Chicago, and other cities, with general supervision over public buildings, monuments, and other artistic undertakings. enactment of legislation, both State and local, designed to regulate billboards in Chicago and elsewhere; appointment of commissions of experts to devise comprehensive plans for the growth of Washington (1901) and similar proposals for New York (1903). Two volumes of *Municipal Affairs* are given to the movement, vol. ii and iii (New York, 1898-99). Consult also C. M. Robinson, *The Improvement of Towns and Cities* (ib., 1900, 8th ed., rev. 1913), id., *Modern Civic Art* (ib., 1903); T. H. Mawson, *Civic Art* (London, 1911).

MUNICIPAL CORPORATION. See MUNICIPALITY.

MUNICIPAL DEBTS. In a strict sense of the word, debts incurred by municipalities. When, however, the total municipal indebtedness of a country is being discussed, particularly in

comparison with state or national debts, the indebtedness of all minor civil divisions is generally included. Municipal debts are divided into bonded (or funded) and floating, and the latter may be divided still further into temporary loans in anticipation of revenue and obligations due for material furnished or services rendered. Bonded indebtedness, as a rule, so far exceeds floating indebtedness that the latter is frequently ignored in ordinary discussions.

History, Objects, and Methods. The development of municipal debt is for the most part coincident with the expansion of municipal functions, an expansion which began with the nineteenth century and was particularly active during the decades between 1850 and 1870. A factor which contributed largely to the growth of American municipal debts was the aid given to railway enterprises. Many municipalities so burdened themselves with debt for the sake of assisting in the construction of railways through their limits, that for many years they were obliged to forego the most essential public improvements. Such railway aid was granted by rural as well as by urban communities.

Railway assistance aside, the chief objects for which urban communities issue bonds are the opening and paving of streets, the construction of water works, sewers, bridges, schoolhouses, and other public buildings, and lighting. Counties, in some sections, issue bonds for bridges and for highway improvements. Finally, school districts, chiefly those located in rural sections, issue bonds to raise money to construct schoolhouses. Obviously, floating debts and loans in anticipation of taxes may have their origin in almost any of the various needs of the municipality. Loans in anticipation of revenues are usually raised on notes or tax certificates. Obligations for material and for labor or other personal services, or for amounts due on contracts, are frequently acknowledged by warrants on the general treasury or on some special fund, and such warrants become negotiable paper. When the cost of specifically local improvements, like paving or sewers, is met by special assessments on the property directly benefited, and the collections are delayed or distributed over a series of years, the obligations are met in a variety of ways, ranging from warrants to short-term bonds. In negotiating municipal loans bonds are commonly sold, after public advertisement, to the highest bidder. Temporary loans on notes are commonly effected at banks.

The financial principles involved in a consideration of municipal debts are in most respects similar to those already set forth under DEBT, PUBLIC; FINANCE. Municipal bonds are issued for definite periods, and the best and common practice is to provide in advance for their payment at maturity. Formerly such provision was made through sinking funds, but for a number of years past there has been a growing tendency to pay off municipal bonds in installments. This plan obviates the necessity of administering a number of special and rapidly accumulating funds, which sometimes present financial difficulties and are always subject to diversion on the part of unscrupulous or ill-advised municipal officials.

In fixing the term for which municipal bonds are to run it should be borne in mind that, since municipal bonds are issued to distribute the expense of certain improvements over a number of years, the term of the bonds issued should bear

some relation to the probable life of the improvement involved. Street pavements, e.g., require renewal in from 10 to 20 years; it would therefore be a gross mistake to make bonds issued to cover their cost run 40 or 50 years. Land purchases, on the other hand, involve a class of property that appreciates rather than depreciates as time goes on; it might accordingly be permissible to pay for them by an issue of long-term bonds.

The interest rates on municipal bonds have fallen from 6 and 7 per cent a few decades ago to $3\frac{1}{2}$ and 4 per cent as a normal figure for the bonds of municipalities of good standing. The premiums generally received virtually lower the interest rate, often to a considerable extent.

Debt Limitations. The interests of borrower and lender combine to make necessary some limit to the amount of indebtedness which a municipality may incur and the purposes for which money may be borrowed. Considering the latter first, it is obvious that permanent loans should never be made to meet current expenses, although occasionally it may be necessary or wise to fund a floating debt that, through bad financing, has grown beyond ordinary revenues. Public loans to aid private enterprises are generally held to be against public policy, and are unconstitutional in some states. As to the amount of indebtedness which a municipality may incur, prudence demands that this be kept so low as not to overburden the taxpayer with interest and other capital charges, or, in the case of productive undertakings, the patrons thereof. Even where there are no constitutional, statutory, or charter limits on indebtedness and taxation, there is a practical limit to the burden of taxation which the citizen will bear. But most municipalities are subjected to definite limitations as to debt and taxation. Such limits vary widely in different countries and states, and even among the cities of a single state. It is generally some percentage of the assessed valuation, but as the relation of this to the actual value of the property assessed varies widely, comparative debt limits are likely to be very misleading unless supplemented by explanatory statements. In general, it may be said for the United States that the legal debt limit ranges from 3 to 10 per cent of the total assessed valuation, although some cities are subject to no legal limitations in this respect. Where the limit is by statute instead of constitution, appeals for its extension or for exemptions on account of certain classes are frequently made to the Legislature. Waterworks bonds are quite often exempted from computations of the debt limit, and recently there have been efforts in several States to exclude from the debt limit all bonds issued for revenue-producing works. In Great Britain some classes of loans are subject to the sanction of Parliament, and the control of other classes has been deputed by Parliament to the Local Government Board. This body has a well-organized staff of experts; it gives formal local hearings on applications for specific loans and grants or withholds its consent to the applications. On the continent of Europe there is some central control of debts in at least Prussia and France. The nearest approach to central control of loans in the United States is found in Massachusetts, but its exercise is due primarily to sanitary rather than financial safeguards. Legislative permission to make water-supply and sewerage improvements is seldom if ever granted in Massachusetts un-

less the plans for the proposed work are approved by the State Board of Health.

Statistics. Reliable comparative figures of municipal indebtedness are even more difficult to obtain than a comparative summary of debt limitations. The debts of individual cities, especially when reduced to a per capita basis, can be interpreted intelligently only when accompanied by statements regarding tax rates, the extent to which the cost of municipal improvements is met by special assessments, and especially by data as to the character and extent of the services rendered to the citizens by the municipality. Low per capita bonded indebtedness is not necessarily advantageous to citizens and taxpayers, since it may mean that the city in question is either without improvements or that its water works, lighting service, bridges, and even sewers are owned by private companies.

For the United States local-debt statistics by cities, States, and for the whole country were given in the tenth and eleventh censuses (1880 and 1890). From 1899 to 1901 the United States Department of Labor devoted a large part of its September Bulletin, each year, to "Statistics of Cities," among which it included bonded, floating, total, net, and per capita net debts, and sinking funds, for cities of 30,000 population and upward. The corresponding statistics, after 1901, have been published from time to time as bulletins of the Census Bureau.

According to the report of the Bureau of the Census on *Statistics of Cities in 1912*, the aggregate net indebtedness of cities having a population of 30,000 and above was \$2,015,600,020, or \$68.74 per capita. The per capita indebtedness varies directly with the magnitude of the city, as the following table shows:

CLASSIFICATION	Total net debt	Per capita
Cities with population over 500,000	\$1,204,136,742	\$95.50
Cities with population of 300,000-500,000	246,779,829	71.88
Cities with population of 100,000-300,000	270,048,931	44.61
Cities with population of 50,000-100,000	174,261,665	42.85
Cities with population of 20,000-50,000	120,372,855	38.12

New York had a net indebtedness of \$792,927,021 and a per capita debt of \$156.57. The lowest per capita debt among cities above 500,000 was that of Detroit, \$18.09. The city of Denver had the lowest per capita indebtedness of all the cities for which statistics are given—\$3.82.

Comparative figures of municipal indebtedness throw practically no light upon the problem of relative economy and efficiency. In general, the cities that are extensively engaged in productive undertakings show a large per capita indebtedness. The increase in per capita debt with increase in the size of cities is to be explained by the fact that the larger the city the greater the number of collective enterprises the city is forced to undertake.

MUNICIPAL FIRE PROTECTION. See FIRE PROTECTION, MUNICIPAL

MUNICIPAL GOVERNMENT. The administration of the affairs of a city, town, borough, village, or other minor civil division of a state, but generally restricted to the government of pure municipal corporations as opposed to quasi-municipal corporations, such as counties, townships, and school districts. Municipal government seldom reaches its fullest development outside of the larger cities, but numerous municipal activities are often undertaken in progressive urban communities of only a few thousand inhabitants. Since the municipality is the creature of the state, it follows that its form of government, its various activities, and its powers are not only derived from the state, but are also subject to alteration or repeal at its will. The municipality has a direct and far more intimate relation with those who are subject to its government than does the state, supplying many wants common to its inhabitants and performing or supervising the performance of many services which outside of the municipality are left to private enterprise.

In some of these respects, as in the exercise of the police power, the care of the public health, the administration of charity, and the administration of local justice, the municipality is actually the agent of the state and discharges duties of interest to the state at large, in others, as in the furnishing of water or light, the state permits the community as a whole to act as a local organization for the satisfaction of purely local needs of interest to the community only. The very remarkable growth of the urban population during the last half century has greatly increased the importance of municipal government and at the same time multiplied its difficulties. For the origin and nature of the legal powers of municipalities, see MUNICIPALITY; see also the general article GOVERNMENT. For the history, growth in population, and certain economic, social, and political phases, see CITY.

Municipal government may be considered under four main heads: (1) functions; (2) organization; (3) finance; (4) public policy.

Municipal Functions. The functions of a municipality include all the public activities of the city, whether direct, such as laying out and maintaining streets, or indirect, such as regulating traffic and maintaining order on the public thoroughfares. These activities are many and complex and frequently overlap, but they may be grouped as follows: (1) the so-called public utilities, which include ways and means of communication and transportation, together with the supply of light and water to the inhabitants; (2) disposal of wastes; (3) protection of life, health, and property; (4) charities and correction; (5) education; (6) recreation; (7) municipal housing. The provision of *ways and means of communication and transportation* is one of the first and most obvious functions of municipal government. Its basis is the public streets, upon the surface of which all land traffic moves, beneath which are placed pipes to bring in municipal supplies and to carry out wastes, and either above or below which are wires for transmitting messages. As an aid to the movement of street traffic, it falls within the duties of the municipal

government either to provide street railways or to see that they are provided and properly operated by private enterprise. In many of the English and Scottish cities the street railways have been constructed and are owned by the municipality, or have been acquired by purchase; they are sometimes leased to a private company for operation. In the United States this is usually a function of private enterprise, subject to the supervision of the city. Where waterways are involved, bridges and perhaps ferries must be provided, and frequently docks, wharves, and harbors as well. Bridges are now almost always built and maintained at public expense. Municipal docks are far more common than municipal harbors. Where docks are required, they often are or may be an important source of revenue, but the first consideration should be to afford every facility for the speedy and cheap handling of goods and passengers. The relation of municipal government to the telephone and telegraph service is chiefly regulative, especially in the United States, and thus far extends but little beyond the police control of the electric wires involved.

One of the most important municipal services is the supply of water for household and industrial purposes, for fire protection, and for sewer and street flushing. The lighting service, like the water supply, is for both public and private use. The light furnished may be either in the form of gas or electricity. Almost everywhere at present the water and lighting supplies are municipal functions, although they may be intrusted to private companies. Municipal markets for the sale of meat and other food supplies are frequently maintained for the sake of both convenience and sanitation. The sanitary aspects of cattle markets, abattoirs, and slaughterhouses are of great importance. Consequently, where markets are not provided, the municipal health authorities exercise, or should exercise, a rigid supervision over private markets and also over the various foods prepared or exposed for sale therein. The supply of such articles as milk and ice to the inhabitants is left to private enterprise, but on sanitary grounds is usually subject to regulation. Infant milk depots are being maintained by an increasing number of cities at home and abroad.

Wastes.—By far the greater part of the large quantity of water supplied to the modern municipality must be removed again in a more or less befouled condition. All American, many British, and the largest continental cities have found water to be the best vehicle for removing excreta, and as a result we have the modern sewerage system, which carries away this dangerous waste together with the water otherwise befouled by domestic use. The surface drainage from roofs, yards, and streets may be removed with the sewage or else in separate conduits. The food wastes of the kitchen and table, consisting of decomposable organic matter, and commonly known as garbage, require collection and disposal (see GARRAGE AND REFUSE); and the same is true of ashes, waste paper, and other rubbish. Street dirt must be collected and removed, and the streets must be sprinkled to keep down the dust which is inevitable even with the best sweeping. All these are municipal functions which cannot be left to private enterprise. Finally, the human dead must be considered under the general head of wastes, and cemeteries must be provided for burying or cre-

matories for burning the bodies. Cemeteries are frequently, but crematories rarely, owned by municipalities. The other services included under the heading "wastes," in so far as they are performed with regularity and system, are almost invariably rendered by the municipality, either directly or by contractors at its expense and under its supervision.

Protection of Life, Health, and Property.—The protective functions of a municipal character include the work of the police, the courts, the fire department, and the board of health, together with the building-inspection service and the provision of public baths, washhouses, and water-closets. *The charities and correction service* includes poor relief and the maintenance of asylums and reformatories. *The educational service* embraces not only the work of the common schools preparatory to the college, but also manual training, and sometimes technical education, night schools, vacation schools, libraries, and museums. The municipality in undertaking the work of elementary education and poor relief is acting as the agent of the state, and is subject to more or less central control so far as these activities are concerned. *The recreation service* includes the establishment and maintenance of parks, playgrounds, gymnasiums, together with the provision for public concerts and lectures. The three first named institutions might also be included under both education and health service, while concerts and lectures may be included under education as well as recreation. *Municipal housing* is practically unknown in America, but is a marked feature of municipal activity in Great Britain. It has arisen partly through the demolition of whole blocks of unsanitary houses, which seemed to make necessary a provision for rehousing the ejected tenants, and partly from a desire to afford municipal aid in the efforts being made by philanthropists to improve the home condition of the working classes. The houses built at municipal expense are generally designed to provide living places thoroughly sanitary in their construction and appointments for the poorest class of self-supporting wage earners.

Organization. The successful administration of the many and varied activities just outlined demands a degree and character of organization resembling in some respects that of a large private corporation. In the government of states it is common to divide the functions of government as well as the officials who discharge them into three groups—the legislative, the executive, and the judicial. The same general plan might be followed in considering municipal government, but separation into these three branches is by no means so easy, on account of the greater overlapping of municipal functions. The judicial power is more a state than a municipal function, and will not be further considered, except to note the existence of municipal police courts for the prompt trial of persons arrested for misdemeanors or crimes and the exercise of judicial functions by city health departments and by city boards which regulate the rates and character of service of utility companies. The legislative functions of municipal governments are exercised primarily by the council, and the executive by various officers and boards, with the mayor as the chief executive officer. Under the commission plan of city government in its extreme form the commission (or council) exercises both legislative and executive functions,

and under the city-manager plan the manager instead of the mayor is the chief executive officer. Some of the executive boards possess quasi-legislative powers, while others, such as boards of health, exercise both legislative and judicial functions. The mayor's duties may be legislative, judicial, and executive. He often presides over the meetings of the council, casts the deciding vote in case of a tie, usually has the power to veto ordinances, appoints officials, supervises the affairs of the city, hears and passes upon charges involving possible dismissal of officials, and sometimes acts as a judge of municipal courts. In the United States the mayor is elected by popular vote, though formerly he was quite generally elected by the council; elsewhere he is commonly appointed either by the city council or by the central government. (See MAYOR.) In point of training the mayors or chief burgomasters of Germany take the lead; in that country the mayoralty is a profession, and a successful officer is promoted from one city to another and larger as his ability and reputation increase. In all countries the mayor is the chief representative of the city, but in Great Britain alone the office is mainly one of dignity and honor. In that country the mayor is a member of the council and presides over its meetings, but he does not possess the veto power. The importance of the mayor's office in the United States is largely due to the control which (except in commission-plan cities) he quite generally exercises over legislation through his power of veto, and (except in manager-plan cities) to his usual power of appointing and removing executive officers. The latter power is generally subject to approval by the council, but it is in larger freedom from this restriction that the growing importance of the office (outside of commission-plan and manager-plan cities) chiefly consists.

The Council. The powers and duties of the city council vary greatly in the different countries of the world, and quite as much so in the several commonwealths of the United States or even in the cities of a single State. Germany leads in the comprehensive control of its councils over municipal affairs, and Great Britain ranks next in this particular. The German and British councils control schools and charities. While the German councils are in some respects subject to the board of magistrates, including the head magistrate, the burgomaster, or mayor, and while the latter has other important functions, the English council has full local control within its sphere. The French municipal councils, unlike those of Germany and Great Britain, have few or no administrative powers, their control being limited chiefly to the appropriation of money and questions of policy. In the United States the councils formerly closely resembled those of Great Britain, and frequently had control of charities and of other municipal activities, but one by one many of their powers were taken from them and bestowed on the mayor or else on independent boards. Among these boards may be mentioned water, sewerage, street, park, fire, police, and health boards, or combinations of two or more of these into a single board. Again, single-headed departments, more or less independent of the council, have been created by municipal charters or by special legislation. The financial control of some of these new bodies has been left with the city council, at least to the extent of making or withholding appropriate

tions and borrowing money by means of bond issues. Since the advent of commission government in the United States the commissions have been much like the British councils in power, except that the American commissions do not control the public schools. In Great Britain and the United States the councils are restricted to the exercise of those powers specifically or impliedly authorized by the state, and implied powers are seldom so construed as to warrant permanent loans, purchase of land, erection of buildings, or other public works. On the continent of Europe grants of municipal authority are far more general and limitations specific, but the central government exercises a general control and supervision over the municipalities unknown in the United States and rarely if ever practiced in Great Britain. In the latter country, however, the Local Government Board in sanitary matters, and the Board of Trade in the case of municipal enterprises which produce revenues, pass upon loans, and by their power of granting or refusing authority for these they exercise no little control over municipal councils. The council in the United States, particularly in small cities, is generally a single-chambered body, elected by districts, although in some States a part of the council is elected by the city at large, but there are still some instances of an upper house, the members of which may be elected by the city as a whole. In England the council sits as one body, but it is composed of councilors elected by the people and of aldermen chosen by the council, usually from its own membership. (See GREAT BRITAIN.) In continental Europe there usually is but one chamber of councilors, and frequently the members are elected on a general ticket. As a rule, the councils in European countries are far larger than those in the United States, containing from 50 to 150 members. In the United States, even where two chambers exist, there are rarely over 50 to 60 members, but Philadelphia is a notable exception, with nearly 200 members in both branches. Beginning with the twentieth century there has been a strong movement towards small councils in the United States, generally elected at large. The commission-plan cities usually have only five commissioners, or less in the smaller places. The tenure of municipal councilors is from one to four years in the United States, from one to three years in Canada; three years for councilors and six years for aldermen in Great Britain, four years in France and Spain, five years in Italy; six years in Austria, Prussia, Hungary, Holland, Belgium; and nine years in Bavaria. In most of the European countries provision is made for periodic renewal of the council. The usual rule is renewal by thirds or halves, annually, biennially, or triennially, according to the length of the term. The most universal legal qualification for councilmen, aside from age, is residence. In the United States councilmen must not only reside in the city which they represent, but, by written or unwritten law, within the district which elects them. In France any taxpayer is eligible, even though not a voter, provided the number of nonresident councilmen does not exceed one-fourth the whole. In England taxpayers residing within 15 miles of the municipality may be elected for any district thereof. Property qualifications for a portion of the members of the council are required in European countries, but in a few cities, including Dresden and

Leipzig, half of the membership must be from non-property holders. In the United States property qualifications for membership in the council were formerly quite common, but are no longer required. In all countries the work of councils is largely done by committees, and this is particularly true of those countries where the council has large powers and duties, which doubtless accounts for the large bodies in Great Britain and elsewhere in Europe. In Chicago and in most small cities the presiding officer of the council is the mayor. In other American cities the council elects its own presiding officer or he is elected by the city at large. In Europe the council usually elects its own presiding officer. Generally speaking, members of municipal councils receive no salary, but in many cities of the United States members receive pay ranging from a small per diem allowance upward to what may be considered fair compensation for the time devoted to the work by the average councilman. In the American cities governed by commission, where the boards meet frequently and their members each take charge of an executive department, salaries are generally paid.

Executive Boards and Officers. These range from the mayor and council committees to the more or less independent boards and commissions so common in the United States, and on down to minor officials acting under these officers. The number and variety of services which these boards and officials perform has been partly indicated in the enumeration of the city's functions. In cities where the council is supreme the committees of that body exercise large executive powers. Great reliance, however, is placed on trained executive officers selected by such committees or by the council as a whole, for the various departments of municipal activity. Outside of the United States such officials are seldom chosen by popular vote, but in that country it is not uncommon to choose many of these officers by popular election. Minor positions are, of course, filled by the board concerned or by the chief executive officer responsible for the work undertaken by the appointee, rather than by popular election or by the council. The town clerk is the most important official in an English municipal corporation. Besides his duties as recording officer of the council and general secretary of the municipality, he acts as legal adviser of the council and as custodian of records. His tenure of office is frequently for life, he receives a high salary, and he is a trained official much as is the mayor of a German city. The city clerk in the United States is never an officer of such training and importance. Generally he is simply a recording officer to the council, or perhaps a kind of mayor's assistant. Legal advice to the municipal authorities in the United States is given by an officer styled the corporation counsel, and suits are prosecuted and defended by a city attorney, although the two classes of service may be rendered by one man, and the names vary in different localities. The city engineer is usually a technically trained man, and municipal engineering has become a distinct branch of the engineering profession. In the large cities the legal and engineering work is so extensive and important as to require large staffs of experts. This is also the case in the financial department, using the latter term to embrace all the executive officers employed in assessing, collecting, and disbursing money

and in maintaining a check on collections and disbursements

Finance. Municipal expenses and outlays are met from the proceeds of taxes, special assessments for benefits, like the frontage tax for street paving, various licenses and fees, the profits from public utilities and from loans, the proceeds of trust funds, and from bequests. Some cities of continental Europe receive no little revenue from landed property, and the cities of Great Britain and Germany, and a few in the United States, derive considerable revenue from municipal franchises. Where municipal ownership prevails in British cities effort is often made to turn into the common treasury a revenue for the reduction of the general tax rate. In the United States a portion of the revenue from water works, and less frequently from other utilities, is sometimes applied in a similar manner. The taxing power is generally limited to the council, the chief exception to this rule being the poor authorities in Great Britain, which have an independent power of taxation. In the United States the councils often have to raise large sums by taxation for independent boards, and also for the county and for the State. It is common for the independent boards to incur bonded indebtedness without consulting the council, but only as the authority, in general or specific terms, is granted by the State Legislature. The subdepartments under the general head of finance are tax assessors, who place a valuation on taxable property, a board of review or appeals from the rulings of the last-named officers, tax collectors, the treasurer, who receives money from the collectors, the disbursing officer or controller, who issues or approves warrants for the payment of bills and claims, and the auditing department. In some cities, particularly the smaller ones, the treasurer is also the disbursing officer, and the council instead of a controller may approve claims. The *municipal budget*, or the estimate of receipts and expenditures upon which the tax rate and appropriations are based, is prepared according to various methods. In general, the several departments make up their respective estimates, and these are amended by the mayor, or by a board or committee, and sent to the council for further amendment and final ratification. As a rule, cities of the United States are deficient in real budget making and also in following such budgets as they do make, but there have been marked improvements in both respects since 1900. A proper budget utilizes past experience with receipts and expenditures to formulate a programme for the ensuing year, and such a programme should be followed.

City Charters. The municipality being a mere creature of the state, its area, powers, and form of government are laid down by the legislature in the form of (1) a specific act or charter, (2) a given act for cities of a given class; or (3) a series of either general acts relating to groups of cities or to all municipal corporations; or (4) special legislation on any subject within constitutional limits. Strictly speaking, the first only is a city charter, but the other grants of power have the same general effect, except that (3) and (4) are successively more confusing and less satisfactory than (1) and (2). In the United States city charters may or may not be, as the Legislature sees fit, submitted to popular vote for approval except as this is regulated by State constitutions. Frequently both

charters and charter amendments are so submitted, and where general municipal corporation acts prevail the transition from one class to another is generally by popular vote, but it may follow from an increase in population. As a rule, voters of a municipality have some voice or influence in framing new or amending old charters, except perhaps where general legislation prevails. This participation goes so far in some cases as to permit the framing of charters by an authorized charter commission or to the adoption of changes requested by the municipal officials. Missouri, California, and Washington led in placing charter making under the control of the municipality, subject to more or less specific legislative restrictions. Michigan and Ohio followed years afterward, and this kind of "municipal home rule" is being extended. The more general practice up to 1915 was for the State legislatures to control all charter making and amending, usually, but by no means always, leaving the adoption of the measures subject to local popular vote.

Other Municipal Problems. A comprehensive term used in discussions of municipal affairs is "municipal reform." This is nothing more or less than an effort to secure honest and efficient municipal government. The problem varies with each locality, and even changes in a given locality from year to year. The bane of municipal government is partisan politics. The remedy for bad municipal government, from whatever cause, invariably lies with the citizens and taxpayers, who are often too indifferent to their own interests, or at least to the public interest, to insist on good government. A decided reform in municipal affairs was effected in Scotland in 1833, and in England and Wales in 1835, as a result of agitation directed against incompetent and corrupt borough government. The reform acts of the year named were supplemented from time to time, and in 1882 a consolidated municipal corporations act was passed. In 1888 another act was passed, providing that cities and towns of more than 50,000 inhabitants should be administrative counties, and also creating a more unified government for Greater London, known as the London County Council. In 1900 this unification was carried still further, but only to the extent of reducing by consolidation into some 15 borough governments a large number of minor authorities. In the United States the progress of municipal reform, as reflected by changed methods of administration, is difficult to trace. This is largely due to the many independent State legislatures controlling municipal affairs, to the great variations of practice within each State, and to the spasmodic efforts for reform. One of the notable steps in many States has been the adoption of constitutional amendments, from 1850 to 1880, prohibiting special acts of the Legislature which apply to a single municipality. Other great agencies of municipal reform in the United States have been the various local, State, and national reform organizations, notable among which have been the good-government clubs, the American Civic Association, the National Short Ballot Organization, the National Municipal League, and the National Civil Service Reform League.

The Commission Plan. The most radical change in the government of cities in recent years has been the adoption in many cities of the commission form of government. The first city to adopt the plan was Galveston, Tex., in

1901. A few other cities followed soon afterward. In 1908 a more elaborate commission-plan charter went into effect at Des Moines, Iowa, and since then the plan has been widely adopted. At the beginning of 1915 more than 400 cities and towns throughout the United States had voted for government by this method.

Commission Government. The commission plan varies widely in different States and even within some of the States, in the latter case depending upon whether special or general legislation prevails. Its most distinctive feature is the combination of all legislative and executive powers in a single small body, typically five but sometimes seven or more in larger cities and sometimes three in the smaller cities. The members of the commission or council are elected at large and, except for the school authorities, are usually the only city officials to be elected—hence the term, “the short ballot.” As a rule, the mayor, who is one of the commissioners, has no more power than his fellow commissioners, but he is the official head of the city. The administrative work of commission cities is divided into as many departments as there are commissioners. Each commissioner heads one of these departments, by virtue either of popular election to the position or through designation by the commission as a whole, as the charter or general law may provide. As a safeguard against vesting such large powers in so small a body and also in accordance with the increasingly democratic spirit of the day, the commission plan almost invariably includes the initiative, the referendum, and the recall. Under the initiative, a stated percentage of the voters may petition the commission to pass ordinances, or in some cases charter amendments. If the council does not see fit to pass the ordinances, then the question goes to popular vote. The referendum works in a like way as regards ordinances enacted by the commission. Similarly, by petition a popular vote may be had on recalling any elected officer, and sometimes appointive officers as well. Other usual features of the commission plan are nonpartisan nominations and elections and publicity.

The adoption of the commission plan sweeps away at a single stroke all the checks and balances and divided responsibility of the mayor-and-council plan and the many independent boards which often accompany it. In their place it sets up a single small responsible body subject to popular control. Administrative responsibility is still further defined by making each commissioner the head of a large municipal department. The very strength of the commission plan is also its weakness. It provides division commanders, but no commander in chief. It fills by popular vote executive offices, some of which call for men of high technical training and large technical experience and all of which call for men of great administrative ability. Instead of insuring the choice of such men, the accidents of popular election place laymen in these important positions. These speedily qualify in their own and the public eye as municipal experts and relegate the trained men far to the rear.

City-Manager Plan. To remedy this weakness of the commission plan, and also to make good some of the worst defects of the ordinary mayor-and-council plan, a considerable number of cities (perhaps 40 or more early in 1915) have adopted the city-manager plan. Carried to

its logical end the manager plan makes the council the supreme and sole policy-determining and money-appropriating body and places the manager in supreme command of the executive forces of the city, which he and he alone selects, subject to whatever civil-service rules may exist. The manager plan was first tried at Staunton, Va., in 1908, was subsequently worked out more completely but not adopted at Lockport, N. Y.; and was put in full force at Sumter, N. C., in 1912. Most of the cities which had adopted the manager plan up to 1915 were quite small, the largest being Dayton, Ohio (population, 116,577 in 1910). It was also the small and relatively small cities which took up commission government at the outset, but it has since been adopted by New Orleans, St. Paul, Buffalo, Portland, Oreg., and Jersey City, to name only places which had a population of more than 200,000 in 1910. As a rule the manager plan has been adopted by cities under or about to come under the commission plan, whence the name commission manager. Although the manager plan appears to be a marked improvement on the commission plan and on at least the weaker variations of the mayor-and-council plan, it is yet to be proved by experience whether the manager plan will be as satisfactory in practice as in theory. The chief uncertainty lies in whether or how many American cities are yet ready to elect the sort of councilmen or commissioners who will, in turn, select and retain in office and refrain from meddling with really efficient city managers. It may be that after extended experience with both the commission plan and with the manager plan as an adjunct of both the commission plan and the weaker form of mayor-and-council plan there will be a reversion to the stronger type of mayor-and-council plan in which the council has only legislative powers and the mayor is the chief executive authority, with sole power of appointment and removal of practically all city officials except the members of the council.

MUNICIPAL HOUSING. See TOWN PLANNING AND HOUSING.

MUNICIPALITY, or MUNICIPAL CORPORATION. A town or city possessed of certain privileges of local self-government, also the governing body in such a town. Municipal institutions date back to the Roman Empire. The provincial towns of Italy, though subjected to the rule of a Roman official, were allowed to

enjoy the right of regulating their internal affairs. A class of the inhabitants called the *cuviri*, or *decuriones*, elected two officers called *duumviri*, whose functions were supposed to be analogous to those of the consuls of the Imperial city, and who exercised a limited jurisdiction, civil and criminal. There was an important functionary in every municipality called the *defensor civitatis*, or advocate for the city, the protector of the citizens against arbitrary acts on the part of the Roman governor. The municipal system declined with the decline of the Empire, yet it retained a fair degree of vitality, and rose to renewed life in union with feudalism and with the Anglo-Saxon institutions of Great Britain. Indeed, some cities of Italy, France, and Germany have derived their present magistracy by direct succession from the days of Imperial Rome, as is notably the case with Cologne. The bishop, as the shield between the conquerors and the conquered, in many cases discharged the duties or obtained the functions of the *defensor civitatis*. To the north of the Alps, under the feudal system, he became officially the civil governor of the city, as the count was of the rural district. In southern Europe, where feudalism was less vigorous, the municipalities retained a large share of freedom and self-government. Of the cities of the Middle Ages some were entirely free. Venice, Genoa, Florence, Hamburg, and Lubeck all stood in this position. Next in dignity were the free Imperial cities in Germany, which, not being comprehended in the dominions of any of the princes, were in immediate dependence on the Empire. Most of these cities rose to importance in the thirteenth century, and their liberties and privileges were fostered by the Holy Roman emperors to afford some counterpoise to the growing powers of the immediate nobility. The chief organs of government in the German cities were the councils, usually one for deliberation and a smaller one for administration, both being chosen from the various trade and artisan guilds. There were also from two to four burgomasters in each city who presided over the council meetings. The Italian cities were governed by executive officers known as consuls, usually 12 in number. By the side of these were a council and a general assembly of the citizens. During the contest between the Italian cities and the Emperor an officer, called the *podestà*, was put in control of the cities which the Emperor succeeded in subjecting to his authority. Other cities, seeing the advantage of a single executive, voluntarily introduced this officer in place of the consuls. In southern France the Italian consular system existed, but occasionally the *podestà* appears as the chief municipal officer. In the northern part of France the *maire* and *échevins* were most frequently the governing authorities of the towns.

Before the Norman Conquest the English burghs were subject to the rule of an elective officer called the portreeve, who exercised in the burgh functions similar to those of the shire reeve in the shire. The Normans recognized the already existing privileges of the towns by granting them charters. One of the most important of these privileges was the *firma burgi*, or lease of the town to the inhabitants in consideration of the payment of a fixed sum in lieu of all feudal dues. This involved the right of the inhabitants to elect their own magistrates, the independent exercise of jurisdiction in their

payment of the local taxes, and the performance of the quota of taxes assigned by Parliament. A sheriff or viscount was placed by the King over each shire, and a bailiff instead of the former elective officer over each burgh. In the larger towns the bailiff was allowed to assume the Norman appellation of mayor. The municipal franchise seems to have been vested in all the resident and trading inhabitants, who shared in the payment of the local taxes and the performance of local duties. Titles to freedom of the town were also recognized on the grounds of birth, apprenticeship, marriage, and sometimes free gift. In all the larger towns the trading population came to be divided into guilds or trading companies, through membership in which admission was obtained to the municipal franchise. Eventually the whole community was enrolled in one or other of the guilds, each of which had its property, its by-laws, and its common hall, and the community elected the chief officers. It was on the wealthier and more influential inhabitants that municipal offices were generally conferred; and it gradually became the practice for these functionaries to perpetuate their authority by cooptation. Contentions and disputes arose regarding the right of election, and eventually the crown threw the weight of its influence into the scale of self-elective ruling bodies. This was the period of incorporation, when charters were granted incorporating, not the inhabitants of the town, but the governing body. No new governmental powers were conferred, but the corporations were given the right to hold property and to sue and be sued. The desire of the crown to control the representatives which the towns were now allowed to send to Parliament led to a reckless policy of granting municipal charters, so that presently the urban communities were overrepresented in Parliament. During the period of the early Stuarts the writ of *quo warranto* was used frequently to deprive the towns of their liberal charters, with a view to replacing them with charters of a less liberal type, in order that the crown might the more easily control the parliamentary representation of the towns. The burghs of Scotland had a history much like that of the burghs of England; their earlier charters were mere recognitions of already existing rights, and were granted to the inhabitants at large. In the course of the fourteenth and fifteenth centuries the municipal suffrage fell more and more into the hands of restricted bodies of men until an Act of 1469 gave to the councils the right of appointing their successors, the old and new councils together electing the office bearers of the corporation. This state of things continued till 1833, not without much complaint. In the Scottish burghs the several trades possessed a much more exclusive monopoly than in England. Along with the outcry for parliamentary reform arose an outcry for municipal reform, and a separate municipal reform act putting an end to the close system was passed for each part of the Kingdom.

In the United States the English system of municipal administration became the type for the government of the early towns and cities. In nearly every instance a special organization was provided for the cities and was outlined in a charter granted by the Colonial Legislature or by the crown. Generally the governing body of the municipality consisted of the mayor, recorder, aldermen, and councilmen. At first the

corporation seldom acted as the agent of the State, but was an organ for the satisfaction of purely local needs, such as the management of local property and finance. It had no power of government except the right to issue local police ordinances. Gradually, however, the municipal corporation came to be an organ for the administration of matters of State concern, as well as of purely local matters. Thus, the regulation of matters relating to public education, the public health, poor relief, elections, local justice, etc., is quite generally intrusted to the municipalities. As now understood, therefore, a municipal corporation in the United States is a body politic and corporate created by the State for the purpose of State administration as well as of local administration, and vested with certain privileges, such as the right to hold property, to sue and be sued, etc. The transformation of the municipality from an organ of local government to an organ for the administration of central matters created the necessity for legislative control, which has had the result of depriving the cities to a very large extent of the management of their local affairs. The corporation is not the body of the people, nor is it the officers collectively considered, but rather that artificial body or legal entity created by the act of incorporation and limited thereby. A distinction must be made between a municipal corporation proper and what are known as quasi corporations not created upon petition of the people of the district, but rather as territorial or political divisions of the State, such as counties, townships, and school districts created for the convenience of State administration. The laws regulating the incorporation of English towns and cities have little application to municipal corporations in this country. Here none are founded on common law or royal charter, and but few are based upon prescription. It may be said that they exist only by legislative enactment, and possess no powers not created by statute. A few municipal corporations are created by charter singly, but general laws of incorporation have been passed in many States, and at the present time the constitutions of more than 20 States forbid the Legislature to incorporate cities and, as a rule, villages by special act. In 12 of these the prohibition extends also to amendments or changes of charters. When the incorporation is single or special the charter sets out that the inhabitants are constituted a body politic with such a name and style; that by that name they may have perpetual succession, and may use a common seal, sue and be sued, etc. The territorial boundaries are defined and provision made as to the form of government—usually by a council made up of aldermen and councilmen or by trustees—as to division into wards, qualifications of voters, powers of city council to collect debts and impose taxes, etc. General laws of municipal incorporation usually start by abolishing all special charters existing and establishing general regulations for the incorporation, government, and regulation of municipal corporations throughout the State. Frequently such laws classify the towns to be incorporated as regards their importance into cities of first or second grade, towns, and villages. To become operative, the charter granted by the Legislature must be accepted by the body of citizens to be incorporated.

When established the municipal corporation is,

in the absence of constitutional provisions to the contrary, completely subject to the power of the Legislature, thus, it has been held that the latter may repeal charter provisions allowing the licensing of liquor dealers, and even such as relate to police regulations. In other words, a municipal charter is not a contract, and may always be altered or revoked, with the important exception that the rights of existing creditors must not be disregarded. The Legislature has general control over public property, thus, it may authorize a railroad to occupy streets of a city without its consent and without payment therefor. But the courts are beginning to hold that the municipalities may also own private property which is not directly devoted to governmental purposes and which is no more subject to control of the Legislature than the property of private individuals. Such are wharves, cemeteries, ferries, libraries, parks, hospitals, etc. The Legislature cannot deprive the municipality of property of this kind, or direct that it shall be applied to other purposes, as, e.g., that land used for a city reservoir shall be converted into a public park. The power of the municipality to alienate its public property without legislative authorization has generally been denied by the courts, although the right to dispose of private property as it sees fit has been readily conceded. It is also a general rule that the public property of a municipal corporation is not subject to execution in satisfaction of a judgment. No exact form of words is necessary to give force to the charter, and the corporation may even be created by implication, as where powers and privileges are conferred upon the inhabitants of a locality which cannot be enjoyed or exercised without acting in a corporate capacity.

The powers which may be exercised by a municipality are such as are expressly granted in the charter, such as may be fairly implied therefrom, and such as are essential to the declared objects and purposes of the corporation—not simply convenient, but indispensable. Any fair or reasonable doubt concerning the existence of a power claimed is resolved by the courts against the corporation. That is to say, the rule of strict construction applies. In some of the recent decisions, however, there is evidence of a tendency to depart somewhat from this rule in the direction of conceding to municipal corporations wider powers, especially as regards the management of public utilities. Thus, it has been held that a municipality which has the right to establish an electric-light plant for lighting the streets may without an express grant from the Legislature distribute lights to private families. Where the city is given discretionary power upon any subject it is not for the courts to say whether such discretion has been wisely used or not, unless fraud is shown or the discretion is being manifestly abused to the oppression of the citizen. Thus, if it have power to open new streets or grade old ones when necessary for the welfare of the city, the question of necessity is one for the determination of its own authorities. But when a municipal corporation is empowered to take certain action for others, and it is beneficial for them to have it done, the law requires that it should be done, although the language is merely permissive in form. Among the principal powers usually conferred upon municipal corporations may be mentioned the right to acquire and hold such property as may be necessary to the proper exercise

of other powers granted, the right of taxation and of eminent domain, the appointment or election of officers, the maintenance of local courts, the enactment of ordinances, and the maintenance of actions in the courts. Many special powers are given, such as relate to the incurring of loans, special assessments, licenses, police regulations, wharves, ferries, entertainment of guests, etc. It is a general rule of construction that the legislative power conferred upon municipal corporations cannot be delegated to other authorities, nor can they divest themselves of it in any manner whatever. The power to act for the general welfare of the city is usually granted, in addition to other powers expressly enumerated. Under this grant it is generally held that municipal corporations may pass such ordinances not inconsistent with other provisions of the charter or the laws of the State as may be expedient in maintaining the peace, good order, safety, and welfare of the community. Thus, they may enact ordinances to provide for a proper observance of the Sabbath, for the closing of saloons at night, for restraining domestic animals from running at large on the streets, for the suppression of vagrancy, for the prevention of cruelty to animals, etc. But the general-welfare grant does not authorize the municipality to levy taxes of any kind. As a result of their contractual powers, however, municipalities may incur debts, provided they are to be paid out of the ordinary income of the city for the current year. The better opinion seems to be that in the absence of a specific grant municipalities may borrow money where it is necessary to the successful existence of the corporation, or for the exercise of privileges granted. Where the Legislature imposes a duty on municipal corporations which necessarily involves large expenditures the power to borrow may be deduced. It has been held that where the city had express power to establish meat markets, a fire department, or a liquor dispensary, the power to borrow could be implied as a necessary means for carrying out these undertakings. It may be laid down as a rule, however, that municipal corporations have no general borrowing power or power to issue negotiable paper in evidence of debts without legislative authorization. The constitutions of many States contain provisions limiting the amount of indebtedness which municipal corporations may incur. The prohibition is usually construed to apply to indebtedness of all forms. It is, however, held by some courts that contracts for meeting the ordinary expenses of the municipality and in anticipation of receipts do not create an indebtedness within the meaning of the limitation. A municipality cannot escape liability for its obligation arising *ex delicto* by pleading that its indebtedness has reached the constitutional limit. Those who make contracts with a municipality whereby its indebtedness is increased do so at their own risk. If, therefore, an individual lends money to a city which has no legal power to borrow he cannot recover it by pleading ignorance of the powers of the city. But where municipal bonds contain recitals that the city is acting within its constitutional power, and has complied with all the requirements of the law, it will be estopped from disputing the truth of such representations as against a bona fide purchaser of the bonds.

The Legislature has no power to enact legislation which will have the effect of impairing the

obligation of a contract between the city and a private party. Thus, it cannot so limit the taxing power of a municipality as to render it impossible for the city to meet its ordinary expenses and pay interest on its outstanding bonds. On the other hand, the Legislature has no power to authorize a municipality to levy taxes for other than public purposes. Thus, it cannot authorize the granting of aid by a municipality (if it involves taxation) to a private enterprise to enable it to begin business. Among the public purposes for which a municipality may levy taxes may be mentioned the construction of sewers, the laying out of parks, the establishment of water works, etc. Moreover, the Legislature cannot levy a special tax upon the inhabitants of a municipality for other than strictly municipal purposes. Thus, it cannot require them to defray the expenses of improving a navigable stream or to take stock in a railway company, although they may be required to build a local canal or levee. The city may be compelled by mandamus to fulfill its obligations to private parties, as where it refuses to levy a tax for the purpose of paying interest on its outstanding bonds or for the satisfaction of judgments against it. The city may be enjoined from doing an injurious act to an individual or from committing trespass upon his premises. Furthermore, it may be enjoined at the instance of a taxpayer from violating the law or doing other acts prejudicial to the general welfare, as where the city proposes to enter into a contract which will create an indebtedness in excess of the constitutional limits. Municipal officers may also be proceeded against under a writ of *quo warranto* for usurping powers not legally conferred upon them. In the United States the practice of frequent interference in the affairs of the cities by the Legislature has led to so many abuses that in most of the recent constitutions provisions have been inserted prohibiting the legislatures from passing special acts which apply to a particular city when a general law can be made applicable. These provisions, however, have frequently been evaded by arranging the cities into classes in such manner that a particular city will constitute a class by itself and by making the act applicable to a single class. The practical difficulties of dispensing entirely with special legislation have led the courts in some instances to sustain the constitutionality of methods of classification which seem unreasonable if not ludicrous. Where a part of a municipality is detached from the main body of the city the old corporation retains all the liabilities and private property of the city if no provision to the contrary is made by legislation. Property of a public character falling within the limits of the new corporation passes into its control, the theory being that there has been no transfer of title, but simply a change of trustee. A new municipal corporation, embracing substantially the same boundaries as the old, is regarded in law as the successor of the old, entitled to all its property rights and subject to its liabilities. Upon the repeal of the charter of a municipal corporation a court of equity will lay hold of its private property and administer it for the benefit of the creditors of the corporation. It is a general rule of construction that if the existence of a municipal corporation is not questioned by the State it cannot be put in issue by a private individual in a collateral proceeding.

In discussing the liability of municipal corporations for torts it is necessary to distinguish between the two classes of powers which they exercise, viz., public governmental functions on the one hand and private corporate functions on the other. When acting in the former capacity municipal corporations are acting as the agent of the State and are governed by the rules of public law, one of which is the irresponsibility of the government for the tortious acts of its agents. When acting in a private local capacity, primarily for the advantage and benefit of the locality, the municipal corporation is subject to the rules of the private law, according to which it is held liable for the torts of its officers. The rule of liability for torts does not apply to quasi corporations, such as counties, townships, school districts, etc., because they are agencies of the State created for the purpose of State administration, and usually without solicitation or concurrence of action of the inhabitants. The principal torts which are imputable to municipal corporations when acting in the latter capacity are negligence, noncompliance with the statutes, nuisance, and trespass. The courts have generally held that municipal corporations are not liable for failure to exercise discretionary legislative power which may be conferred by the Legislature or for the manner in which they may exercise it if done in good faith. Thus, it is not liable for its neglect to abate a nuisance, as where an individual was injured by an explosion of fireworks which the municipality was authorized to prohibit. But where the duty is ministerial and absolute the corporation becomes liable for the injury arising because of failure to perform it, and where it positively licenses something which constitutes a nuisance it will be held liable for any injuries that may result therefrom. In the exercise of a discretionary power, as in the construction of a sewer, the city will not be held liable for injuries resulting from defective service unless it results in the positive invasion of an individual's property and unless it can be shown affirmatively that the municipality has been guilty of negligence. It is a general rule that a municipal corporation is not liable for injuries arising from neglect or failure to enforce strictly its ordinances for the good government of the city, but an act of the Legislature making the city liable for property destroyed by mobs has been held to be constitutional. In the exercise of its police powers the city is not generally liable for the acts of omission of its agents, as where a policeman shoots a bystander while attempting to kill a dog running at large. The same is true of negligence on the part of the fire department and of the health department. In all these cases the municipality is acting in its public governmental capacity as an agency of the State. In the management, however, of institutions not directly connected with the function of government, such as wharves, gas and water works, markets, and washhouses, municipal corporations are held liable for injuries that may result therefrom, the theory being that in this capacity the corporation is engaged in private business, from which often a revenue is derived. It is also a general rule that municipal corporations are responsible for the management of streets. The rule, however, does not apply to quasi corporations in the management of public highways. This is due to the fact that, unlike pure municipal corporations, they are

engaged chiefly in the performance of public governmental duties from which they do not generally derive any revenue or particular private advantage. The peculiar rule exists in New England that the property of any citizen of a municipality against which a judgment has been recovered may be seized in execution thereof. Elsewhere the remedy is execution upon the private property of the municipality. Consult: H. S. Abbott, *Treatise on the Law of Municipal Corporations* (3 vols., St. Paul, 1905); Eugene McQuillin, *Treatise on the Law of Municipal Corporations* (6 vols., Chicago, 1911-13); R. W. Cooley, *Illustrative Cases on Municipal Corporations* (ib., 1913). id., *Handbook of the Law of Municipal Corporations* (ib., 1914).

MUNICIPAL LABORATORIES. See LABORATORY.

MUNICIPAL LAW. In English and American law the ordinary "law of the land," i.e., of the country, comprehending both the public and the private law, as distinguished from the external law or law of nations. To the Romans, municipal law meant the special law of the cities, other than Rome, which were included in the Roman Empire. A *lex municipalis* was a city charter granting limited self-government in matters of local interest. On the Continent, towards the close of the Middle Ages, the phrase was sometimes used to describe any local law, whether of a city or a province, as contrasted with the general law of Christendom, i.e., the Roman law, civil and canon. Later, with the development of international law, municipal law came to describe local law in contrast with international law. The term is no longer used in this way on the Continent. municipal law now means city law as contrasted with national law, but among English-speaking peoples national law is called municipal in contrast with international law. English municipal law has thus become the very inappropriate description of all the law, written or unwritten, by which England is governed in matters purely English.

The expression "municipal law" is sometimes, however, employed in the United States in the continental sense above indicated, to describe the organization of municipal corporations and the local laws enacted and enforced by municipal authorities. It is under this head (municipal corporations), therefore, that information concerning the organization of city, county, township, and village governments, and police laws for the restraint of vice, may be found. See MUNICIPALITY. Consult Eugene McQuillin, *A Treatise on the Law of Municipal Ordinances* (Chicago, 1904), and Brand Whitlock, *On the Enforcement of Law in Cities* (Indianapolis, 1913). See INTERNATIONAL LAW, JURISPRUDENCE; LAW.

MUNICIPAL LEAGUE, NATIONAL. An organization composed of individuals and associations seeking to accomplish municipal reform in the various cities of the United States. It was established in New York in 1894 as the outcome of a national conference held in Philadelphia in January of that year to promote the interests of good government. The league has no partisan political interests whatever, but confines its operations to the securing of good municipal laws, the appointment of men of integrity and ability to office, and the correction of abuses in municipal methods of government in American cities. Through its annual confer-

ences it enables the workers in behalf of municipal betterment to come into personal touch and exchange views. By means of active committees the league has brought together groups of acknowledged experts and public men who have formulated reports of great value to publicists, students, and administrators. Through its executive officers the league is in constant touch with local and national movements concerned with municipal questions. Its annual conferences are among the most important meetings of experts in municipal reforms in the United States, and the reports, including the secretary's annual review, the most valuable statements upon these subjects. In 1900 the league published a municipal programme for a constitutional amendment and municipal corporations act. In 1915 it issued a model charter prepared by a representative committee. Consult *Proceedings of National Municipal League, 1894 to 1910* (Philadelphia, annually), and *National Municipal Review*, a quarterly periodical (Baltimore, 1912 et seq.)

MUNICIPAL OWNERSHIP. Possession by a municipality or any minor civil division of the state. The term is, however, more commonly limited to public as opposed to private ownership of water works, lighting plants, street railways, telephone systems, and other revenue-producing industries designed to meet the wants of urban populations. The term generally implies municipal operation as well as ownership, but exceptions are frequent and sometimes notable. The term "municipal socialism" has sometimes been used in much the same sense as municipal ownership, but it is more inclusive, embracing various efforts to meet the collective wants of a municipality, whether founded on municipal ownership or not. In its broadest sense, municipal socialism would provide for all wants common to the citizens of a municipality in so far as they were not met by the state. A narrower usage would apply the term more particularly to unusual municipal enterprises, such as the management of coal yards or bakeries. The term "municipal trading" has been applied in England to municipal ownership, but it has not gained currency outside of Great Britain.

The services which a municipality may be expected to render its citizens are more comprehensive than those included under municipal ownership, municipal socialism, or municipal trading, as may be seen by referring to the article MUNICIPALITY. The object of the present article is to consider those undertakings which require the use of the streets or other public places, and which might be carried on by either municipal or private enterprise, but are actually carried on by the former. Since by their nature such undertakings exclude competition, they are called natural or municipal monopolies. Under either kind of ownership they can be carried on only by authority from the state, in the form of general or special legislation, besides which a private corporation must generally secure the grant of a municipal franchise permitting it to use the public streets. Within the limitations stated the most common objects of municipal ownership are sewerage systems and water works and gas and electric-lighting plants. More rarely street railways, ferries, and telephones are owned by the municipality.

Aqueducts for the supply of the cities of antiquity were the nearest approach to municipal

ownership as the term is understood to-day, although from remote times cities have owned lands, improved harbors, built docks, and derived revenues therefrom. But these services were confined to a relatively small number of important cities until the nineteenth century, when water works, gas works, electric-light and power plants sprang up with increasing rapidity. At the opening of the twentieth century these services were to be found in practically all the larger and in the majority of the smaller municipalities of the civilized world, particularly in the United States, Great Britain, and to a less extent on the continent of Europe and in Australia.

The proper scope of municipal ownership is still a subject of debate. Perhaps the nearest approach to a general agreement is (1) that it may rightly embrace all those services which are primarily or largely of a sanitary character, like water supply and sewerage, and (2) that it should be restricted to quasi-public industries, in which private competition is impossible or at best uncertain. Under (2) some draw the line so as to include only imperative and universal needs, the supplying of which is at the same time a natural monopoly. The difficulty with such a limitation is that it varies with local conditions, time, and individual opinions. Thus, the demand for public lighting in the larger cities of the present day is far more imperative than was that for a public water supply a hundred years ago, or in some localities to-day. There is a growing conviction that the relative cheapness and efficiency of service are the chief facts to be considered in deciding between public and private ownership, and that local conditions determine whether public or private ownership is the better in these respects. A third point upon which there is more or less agreement is that municipal ownership should not be carried so far as to increase municipal debts beyond prudent limits. So far as revenue-producing municipal works of a monopolistic character are concerned, it is generally possible so to adjust income and expense that the revenue from such undertakings will meet capital charges as well as other expenses. But there is also the possibility that the popular demand for low charges will result in a deficit that must be met from the general tax rate, and with a large number of municipal undertakings to be provided for it is conceivable that this might prove financially embarrassing if not disastrous.

The municipal-ownership question has been given a different aspect in the United States with the rapid increase in the number and power of State public service or utility commissions. The control which these commissions now exercise over the rates and service of the various municipal-franchise companies makes it less necessary than formerly for cities to adopt municipal ownership for the protection of both public and private consumers. Nevertheless the movement for municipal ownership continues.

Water Works. With the exception of sewerage systems, which rarely yield a revenue, water works are the most common form of municipal enterprise.

In the larger cities of the United States municipal ownership is the rule, all but 9 of the 56 cities of over 100,000 population (census of 1910) owning their own works at the beginning of 1915. New York, which was

first supplied by a private company in 1776, put municipal works in operation in 1842. Chicago was supplied by a company in 1840, and by its own works in 1854. Philadelphia built its works in 1801. At Boston a private company established water works in 1652—the first public water supply in the United States. A second small company built works in 1796, and continued to operate on a small scale until 1893, when its pipes were bought by the city, which had built works in 1848. The Baltimore works were built by a company in 1807, and bought by the city in 1854. Cleveland built its works in 1854–56. At Buffalo a company established works in 1852 and was bought out by the city in 1868. In San Francisco the water works were still under private ownership in 1915, but a proposition for purchase by the city received an actual but not a legal majority of votes at a popular election held on April 20, 1915, and it was expected that the long-continued movement for municipal ownership would be successful within a few years. At Cincinnati a company built works in 1820 and sold them to the city in 1839. Up to the close of 1896 changes from private to public ownership had occurred in 205 cities and towns, against only 20 changes from public to private ownership. There have been many changes to municipal ownership since 1896, but complete figures are not available.

In the *United States* in 1801 there were but 16 works, of which only the plant at Winchester, Va., was owned by the city it served. The development of municipal ownership during the century is shown by the accompanying table.

PUBLIC AND PRIVATE WORKS IN THE UNITED STATES

AT THE END OF EACH DECADE, BEGINNING WITH 1800 *

YEAR	Public	Private	Total	Per cent of total, public
1800	1	15	16	6.3
1810	5	21	26	19.2
1820	5	25	30	16.6
1830	9	35	44	20.5
1840	23	41	64	35.9
1850	33	50	83	39.7
1860	57	79	136	41.9
1870	116	127	243	47.7
1880	293	305	598	49.0
1890	806	1,072	1,878	42.9
1896	1,690	1,489	3,179	53.2

* Compiled from the *Manual of American Water Works* for 1897, the latest complete figures available early in 1915. Later returns, summarized in the *McGraw Water Works Directory* (New York, 1915), show that of 4875 listed towns in the United States, 3045 had municipally owned works, 1355 privately owned 37 mixed ownership (probably both public and private), and 435 were supplied from other towns. These figures cannot be directly compared with those given in the table because the classification in the *Manual* is by works and in the *Directory* by towns supplied, and the *Directory* lists 435 towns supplied by works in other towns, without giving the ownership. Moreover, there is reason to believe that the *Directory* omits a considerable number of small places having works, most of which are probably in public ownership.

The relative decrease in public ownership from 1870 to 1890 was due to the remarkable activity of private water company promoters at a time when the municipalities were just awakening to the need for such improvements, but lacked the funds for public ownership, or had not become infused with the spirit which would lead towards such ownership.

In *Canada*, in 1896, municipal ownership pre-

vailed in 75 per cent of the municipalities having works, or 109 of 145 cities and towns. In 1911 there were in Canada 276 municipal (80 per cent), 70 private, and 2 works of unstated ownership. Late in 1914, or early in 1915, 256 towns (84 per cent) were supplied by public works, 48 by private, 4 by mixed ownership and 5 by other towns (ownership not given). At Montreal water works were built by a private company in 1801 and bought by the city in 1845. At Toronto private water works were built as early as 1841 and were bought by the city in 1873.

In *Great Britain* municipal ownership of water works is the general rule. Water works appear to have been introduced by the municipality of London in 1283, by Plymouth in 1585, and by Oxford in 1610. Manchester and Liverpool each bought out a private company in 1847, Glasgow in 1855, Birmingham in 1876, and Sheffield in 1888. Edinburgh transferred municipal works to a company in 1819, but they were restored to municipal ownership in 1869. Greater London was served for many years by eight companies, beginning with the New River Company, whose works were completed in 1613 with the aid of James I. The other seven companies dated from 1721 to 1822. After years of agitation for municipal ownership, a parliamentary Act was passed in 1902 providing for the purchase of the London companies and the control of the water supply by a joint board representing the several boroughs and the other public bodies comprised within what is known as Greater London. The transfer was made in June, 1904.

Most of the large cities of the *European continent* have extensive water works. Berlin secured control of her water works in 1873, buying them from a company which began to build them in 1853. Hamburg and Frankfort-on-the-Main, Vienna, Moscow, Paris, Rome, and other large cities own their water works. The municipal water works of Rome may be said to date from 312 B.C. (See *AQUEDUCT*). At Paris an old Roman aqueduct was restored in the seventeenth century, and a small municipal supply seems to have been continued from that date until more adequate works were installed by the city about the middle of the nineteenth century. As a rule, private ownership prevails in Latin-speaking countries. In Australia there are a number of important municipal works.

Gas Works. In North and South America these are rarely under municipal ownership, but in Europe they are frequently owned by the municipality.

Of 981 towns in the *United States*, each having a population of 3000 and more by the census of 1900, returns for the close of 1901 showed 21 municipal works, but of these the Philadelphia plant was leased to a private company in 1897, after over 50 years of municipal ownership and operation. Two of the 21 municipal plants supply natural gas. The municipal works at Richmond, Va., were established in 1852. The thirteenth United States census (1910), in its volume on "Manufactures" (vol. x, Washington, 1913), reported for the United States, in 1909, 119 gas works owned and operated by the municipality. Of 11 others which were not owned or operated by firms, individuals, or corporations, 8 were cooperative associations.

Of 1615 gas works in *Great Britain and Ireland* reported in 1905, 285 were owned by the

municipalities served, and they supplied about half the population involved. With the exception of London, Liverpool, and Dublin, nearly all the large towns have works owned and operated by the municipality.

At least 41 of 54 cities of *Germany* having a population of 50,000 and upward have municipal works, and as far back as 1885 figures for the whole country showed 338 municipal to 329 private gas works. Among the larger cities with private works are Munich, Frankfort-on-the-Main, and Altona.

Municipal works are found in most of the cities of Holland, Norway, Sweden, and Switzerland, and in a few cities of France, Italy, and Australia.

Sewerage. Municipal ownership is almost universal, but many countries are practically without sewerage systems for household wastes. It is doubtful if any country is better provided with sewerage facilities than the United States, where 1096 of the 1524 places with a population of 3000 in 1900 reported sewerage systems late in 1901. Of the 1096 places then having sewers, private ownership was reported in 47 instances. Most of these sewer companies were in very small and none were in large places. Atlantic City, N. J. (pop. 1910, 46,150), still had a privately owned sewerage system in 1915.

Street Railways. This class of service has been developed since 1850, and up to 1870 was confined chiefly to the United States. Municipal ownership outside of Great Britain is rare, and even there it has sprung up recently. In fact, until 1893 Huddersfield, England, and the railway on the Brooklyn Bridge were the only examples of municipal ownership and operation, the first dating from 1882 and the second from 1883. A few British cities constructed railway tracks and leased them to companies between 1870 and 1893. On March 31, 1905, for the cities and towns, and on Dec. 31, 1904, for the companies, ownership of street railways in the United Kingdom was divided as follows: England and Wales, 161 public and 115 private; Scotland, 12 and 12; Ireland, 1 and 19. In the municipal-ownership list such large cities as London, Manchester, and Sheffield are included, but there are also private lines in some of the large places. The operation of the railway on the Brooklyn Bridge, New York City, was assumed by a private company in 1898, in connection with the Brooklyn railway service. In 1901 the small city of Grand Junction, Colo., assumed the ownership and operation of a short horse-railway line. San Francisco completed a municipal railway line on Geary Street in June, 1913, and in January, 1915, owned or had under construction 48 miles of railway. At the same time Seattle also owned some street-railway mileage and Detroit expected to buy out the local company. In 1902 an electric railway at St. Thomas, Ontario, was taken over in like manner. The street-railway system of Toronto, Ontario, was bought by the city at the expiration of the franchise of a company in 1891. After being operated for a few months by the city it was sold to a company, under a contract providing for conversion by the purchaser from horse to electric traction, together with a payment to the city of a percentage of gross receipts increasing with the latter. Since then a number of smaller cities in Ontario and the more western provinces have established municipal railways. In other countries than those

already named there, are a few street railways owned by the city and leased to operating companies. A subway to accommodate street-railway traffic in congested districts of Boston was completed by the city in 1897 and 1898 and leased to a company, and since then other subways have been provided in like manner, including one to Cambridge, put in use in 1912. A rapid-transit subway built by New York City and leased to a company for operation was put in service in 1904. In 1915 rapid-transit subway and open-air railways were under construction or planned by New York City which totaled 325 miles of track. The leases of both the Boston and New York subways are on such terms that the rentals will eventually reimburse the cities for their outlay. In each case the operating companies provide all equipment. In 1914 Philadelphia was considering extensions to its short subway system which had been in operation for some years.

Electric Lights. This service was started on a practical scale in or about 1880.

Probably the first municipal plant in the United States was put in operation in 1882 at Fairfield, Iowa. At the close of 1898 there were in places of 1000 or over by the United States census of 1890, 460 municipal and 2572 private electric-lighting plants. In 1902 there were 815 municipal and 2085 private electric-lighting plants in the United States, regardless of the size and number of places supplied thereby, and in 1912 of a total of 5221 central stations 1562 were under municipal and 3659 under private ownership. The largest municipal plants are at Chicago and Detroit; but these, like many other American municipal electric-lighting plants, are for lighting streets and public buildings only.

The first electric-lighting plant in the United Kingdom was established by a private company in 1882. The oldest municipal plant was started by Bradford in 1889. At the close of 1901 there were only 248 works in operation in the United Kingdom, of which 168 were municipal. In addition, 84 municipalities and 31 companies were then installing works. Among the larger municipalities Glasgow bought out a company in 1892, Liverpool in 1897, Leeds in 1898, Sheffield in 1899, and Birmingham in 1900. Dublin built works in 1892, and in 1893 Edinburgh and Manchester did likewise. London is divided between municipal and private ownership.

On the continent of Europe private ownership of electric-lighting plants seems to be the rule. The works of Berlin were opened by a company in 1886, but the city controls their operation in important particulars. At Hamburg municipal works were put in operation in 1889.

Telephones. This service, like the telegraph, is generally controlled by large companies or by the general governments. Tunbridge Wells, England, and Glasgow, Scotland, inaugurated the first municipal telephones in Great Britain in 1901, and Swansea, Brighton, and Hull had followed by the close of 1905. The Tunbridge Wells plant was sold to the National Telephone Company. The English trunk lines and a large London exchange were long owned by the national postal authorities, and, in 1912 all the lines and exchanges of the National Telephone Company were taken over by the Post Office.

Ferries. In the United States there are perhaps 10 cities with municipal ferries to 70 with

private ones. Boston was long the most notable example of municipal ownership in the United States, but in 1903 and in 1905 New York City took over the Staten Island and the East Thirty-ninth Street ferries from private companies. In Great Britain a large municipal ferry between Liverpool and Birkenhead is owned and operated by the latter municipality. Public bodies at Glasgow and at Belfast also control ferries. There are a few other municipal ferries in Great Britain.

Other Industries. The chief additional services that might properly be discussed under municipal ownership, as here considered, are docks and wharves and public markets. The former, particularly on a large scale, are more frequently found in Europe than in America; but for many years New York City has expended many millions on dock construction, and received a considerable yearly revenue from dock leases. Since 1905 many cities of the United States and Canada have gone extensively into dock construction and some into harbor improvements. Municipal markets are common in Europe, Australia, and Canada, where they are frequently exclusive in character. In the United States they exist, but they are in competition with private markets. Of cities and towns of over 30,000 inhabitants 129 were reported in 1901 to have municipal markets, but doubtless the list was incomplete, and at the same time it included some outdoor markets or market places. New York, Boston, Baltimore, and New Orleans have large markets, which yield considerable revenue. In 1915 many American cities were giving close study to the market problem and some had spent or were spending large sums of money for markets, spurred on by the "high cost of living" and other sociological considerations. Subways for electrical wires have been constructed in a number of American cities for lease to the various owners of wires. A few cities have built such subways for general use and receive a rental therefrom.

MUNICIPAL GOVERNMENT

MUNICIPAL REFORM ACTS, ENGLISH.

The various acts passed by Parliament in the nineteenth century aiming to reform the government of the English municipalities. The parliamentary reform of 1832 having left untouched the notorious abuses in the English system of municipal government, a parliamentary commission was appointed the following year to investigate exhaustively the general condition of municipal corporations throughout the Kingdom. A monumental report was made by the commission showing that the municipal governments were in the hands of self-elected cliques; that the corporate funds were wasted, that public improvements were almost wholly neglected; that the municipal courts were corrupted and prostituted for party purposes, and that the whole system of municipal institutions as then constituted was a source of weakness rather than of strength to the country at large. The report of the commission was followed by the Municipal Corporations Act of 1835, which has been well called "the great charter of English municipal freedom." By this act 178 boroughs were reformed, 125 others given corporate privileges, and provision was made for the remedying of many defects and the correction of the most notorious abuses of the municipal system. It admitted to the franchise all property owners and occupiers of property rated at £10 per annum, and established a uniform system of municipal organization. This scheme provided first for an elected council varying in size according to the population of the borough; the council was to be a bicameral body, the upper house consisting of a certain number of aldermen elected by the council. The act further provided for a mayor to be chosen by the body of councilors and aldermen from among their own members. The mayor, aldermen, and councilors were to constitute the full municipal governing body. The chief features of this act have remained as the framework of the English municipal constitution, although the various acts of Parliament passed from time to time modifying in nonessential particulars the municipal structure made a consolidation and revision of the statutes necessary. This was accomplished by the consolidated municipal code of 1882. By the Local Government Act of 1888 the municipal constitution was modified to the extent that cities and towns with a population of 50,000 inhabitants were made distinct counties for administrative purposes, the municipal councils assuming all duties which would otherwise devolve upon county councils. Consult: M. D. Chalmers, *Local Governments* (London, 1883); F. J. Goodnow, *Comparative Administrative Law*, vol. i (New York, 1897); G. B. Shaw, *Municipal Government in Great Britain* (ib., 1901). See works referred to under MUNICIPAL GOVERNMENT. MUNICIPALITY.

MUNICIPAL UNIVERSITY, AKRON. See BUCHELE COLLEGE.

MUNICIPIUM, mū'nī-sīp'i-ūm (Lat., from *munus*, duty, service, especially to the state, and *capere*, to take; apparently, the taking up of public services. Some, however, take *munus* as "privilege," and interpret "of the receiving of political privileges.") A term used by the Romans to denote the relation of certain towns to the Roman state. It was first used when Tusculum (see FRASCATI) received Roman citizenship, in 381 B.C. It came into greater prominence at the close of the Latin War, 338 B.C. Henceforth, in their relation to Rome, the

towns of Italy were (1) *Colonia Civium Romanorum*, whose members were full citizens of Rome, or (2) *municipia*, whose members had partial Roman citizenship, or (3) *Civitates Fœderatæ*, whose members were not Roman citizens at all. The members of the *municipia* had, at first, in general, the *jus connubii* and the *jus commercii*, i.e., the right of intermarriage with citizens of Rome and the right to do business with them, but they did not possess the *jus suffragii*, the right to vote at Rome, or to hold office there. This *jus suffragii* was, however, given to many *municipia* in the second century B.C. A great change came after the Social War (q.v.). Henceforth, by the Lex Plautia Papiria every town in Italy proper might, on certain clearly defined conditions, gain Roman citizenship, and the term *municipium* was now applied to every urban group of Roman citizens in Italy. The *municipium* in this developed form had local self-government, and its citizens could also vote and hold office at Rome itself. Julius Cæsar extended this system to Cisalpine Gaul, Augustus and later Emperors extended it throughout the Empire, by giving full or partial citizenship to various towns. Consult the articles "Colonia" and "Civitates Fœderatæ" in W. Smith, *A Dictionary of Greek and Roman Antiquities*, vol. i (3d ed., London, 1890); A. J. H. Greenidge, *Roman Public Life* (ib., 1901); J. E. Granrud, *Roman Constitutional History* (Boston, 1902); L. Friedländer, *Town Life in Ancient Italy* (Eng. trans. by W. E. Waters, ib., 1902); F. F. Abbott, *A History and Description of Roman Political Institutions* (3d ed., ib., 1911); J. S. Reid, *The Municipalities of the Roman Empire* (Cambridge, 1913); the article "Municipium," in Friedrich Lübker, *Reallexikon des klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914).

MUNISING, mū'nī-sīng. A city and the county seat of Alger Co., Mich., 45 miles east-southeast of Marquette, on the Munising, Marquette, and Southeastern Railroad (Map Michigan, C 2). The chief industry is lumbering. It has a fine hospital, and there are tanneries, paper mills, and manufactories of veneer and woodenware. Pop., 1900, 2014, 1910, 2952.

MUNJAH. See MOONJA.

MUNK, munk, HERMANN (1839-1912). A German physiologist. He was born at Posen, studied at Berlin and Göttingen, and in 1862 became docent in the former university. Seven years afterward he was promoted to assistant professor, and in 1876 to professor, of physiology at the veterinary college at Berlin. Besides studies on the productive methods of threadworms Munk wrote on the physiology of the nerves and especially on the brain: *Untersuchungen über das Wesen der Nervenerregung* (1868); *Ueber die Funktionen der Grosshirnrinde* (1881; 2d ed., 1890); *Ueber die Ausdehnung der Sinnessphären in der Grosshirnrinde* (1901-02); *Ueber die Funktionen des Kleinhirns* (1906-08); *Zur Anatomie und Physiologie der Sphäre der Grosshirnrinde* (1910).

MUNK, JENS (1579-1628). A Danish navigator, born near Arendal, Norway. In 1619, under the auspices of King Christian IV, he set out with two ships to discover the Northwest Passage to the Indies and China. He penetrated Davis Strait as far north as 69° and then turned southward and spent the winter on Chesterfield Inlet. Cold, famine, and scurvy destroyed so

many of his men that only two persons besides himself survived. With these he sailed for home, reaching Bergen, Norway, in September, 1620. Just when ready to start on a new Northwest Passage journey to take possession of "New Denmark" for the Danish crown he died. An account of his first voyage was published at Copenhagen in 1623 as *Efterretning af Navigationen og Reisen til det Nye Danmark af Styrmand Jens Munk*, new edition by Peter Lauridsen (Copenhagen, 1883); C. C. A. Gosch, *Danish Arctic Expeditions 1605 to 1620*, vol. ii, Hakluyt Society, No. xcvi (London, 1897).

MUNK, SALOMON (1803-67). A French Orientalist. He was born in Glogau, Silesia, of Jewish parents, studied Oriental languages at Berlin, Bonn, and Paris, and in 1842 was made custodian of Oriental manuscripts in the Paris National Library. He accompanied Montefiore and Crémieux to Egypt, bringing back many valuable manuscripts. Although he had become blind, he was in 1865 appointed professor of Hebrew, Chaldee, and Syriac in the Collège de France. He was a member of the Académie des Inscriptions et Belles-Lettres, and published an edition (with French translation) of the *Guide of the Perplexed* (1856-61) by Moses ben Maimon (See MAIMONIDES). His further works include *Palestine* (1845) and *Philosophie chez les Juifs* (1848).

MUNKÁCS, mun'kách. A town in the County of Bereg, Hungary, situated on the river Latoreza, 69 miles east-southeast of Kaschau (Map: Hungary, H 2). It has manufactures of coarse cloth, flour, spirits, a refinery of petroleum, and trade in lumber, cattle, and grain. In the vicinity are mined alum, iron, and crystals. The fortress of Munkács, situated on a rock near the town and used as a prison, is noted for its many sieges, especially for its defense against the Austrians, to whom it surrendered in 1688 after a siege of three years, the garrison having been commanded by Helen Zrinyi, the wife of the patriot leader Tökölyi. Pop., 1900, 14,416, 1910, 17,240.

MUNKÁCSY, mun'ká-ché, MICHAEL (1844-1900). An Hungarian historical and genre painter, whose real name was Michael Lieb. He was born at Munkács, Feb. 20, 1844, the son of a petty official, became an orphan at an early age, and in 1855 was apprenticed to a joiner. After several years of hard work and privation chance threw him in the way of the portrait painter Szamosy at Gyula, who aided and befriended him, as did also the landscape painter Ligeti, at Budapest, whither Munkácsy had gone in 1863. A small grant from the art society there enabled him to study for a year (1865) at the Academy in Vienna, under Rahl, after which he proceeded to Munich, where he studied under Alexander Wagner and found a special protector in Franz Adam, the battle painter. In 1868 he went to Düsseldorf to work under Knaus. Two years later his first important picture, "The Last Day of a Condemned Man" (in the collection of Mrs. W. P. Wiltach, Philadelphia), took Paris by storm, bringing him the gold medal. His future was forthwith assured, and in 1872 he took up his residence in Paris, where for several years he continued to depict episodes from the popular life of his native country with impressive truthfulness and a sombre, blackish coloring. In 1876 he entered upon a new field, painting a series of charming

Paris interiors, in which he adopted a richer coloring, but his most important production of this period was "Milton Dictating Paradise Lost" (1878, Public Library, New York). It was not, however, until 1881 that he reached his own ideal with the completion of the now world-famous "Christ before Pilate" (John Wanamaker, Philadelphia), which has become one of the most widely discussed pictures of recent times. It was exhibited all over Europe and in the United States in 1886, on which occasion Munkácsy visited New York. In 1884 he painted his second biblical subject, "Christ on Calvary" (Dresden Gallery), which, like its predecessor, is replete with dramatic life, treated in the light of history with ethnographic reality. It also was brought to America in 1887, and the artist's next important work, "The Last Moments of Mozart" (1886), a touching representation of the dying composer rehearsing his famous *Requiem*, found its way into the collection of Gen. Russell A. Alger, Detroit, Mich. His subsequent creations were of a decorative character and comprise the "Apotheosis of the Fine Arts," for the Art-Historical Museum in Vienna, and "Árpád Taking Possession of Hungary" (1896), for the new House of Parliament in Budapest. In the same year he painted his last important canvas, "Ecce Homo." The strain and disappointments connected with this work brought on a mental disease, and the artist passed the last three years of his life in a sanitarium at Endenich, near Bonn, where he died, May 1, 1900. Many of the prominent public and private collections of the United States contain examples of his paintings. "The Pawnbroker's Shop," "The Music Room," and "The Two Families" are in the Metropolitan Museum, New York. "The Prowlers of the Night" is in the Pennsylvania Academy, Philadelphia, and "The Story of the Battle" in the Walters Gallery, Baltimore. Munkácsy's reputation has not been maintained at the height it reached during his lifetime, and he is frequently criticized for his overdramatic interpretation of sacred themes and for the sooty effect of his color. Consult: T. R. Tart, "Michael Munkácsy," in *American Art Review*, vol. ii (Boston, 1881); F. W. Ilges, "M. von Munkácsy," in *Künstler-Monographien*, vol. xl (Bielefeld, 1899); Tahi, in *Die Kunst für Alle*, vol. xv (Munich, 1900).

MUNN, ORSON DESAIX (1824-1907). An American publisher and patent attorney, born at Monson, Mass. He was educated at Monson Academy. In 1846, in conjunction with Alfred E. Beach, he established the firm of Munn & Co. and bought the *Scientific American*, which had been founded six months before and which, under this management, became one of the leading popular scientific journals in the United States. In 1876 the *Scientific American Supplement* was established, and in 1885 a monthly magazine called the *Architects and Builders Edition*, now known as *American Homes and Gardens*. Under O. D. Munn's supervision Munn & Co. became the largest firm of patent attorneys, and is now the oldest, in the United States.

MÜNNICH, mū'ník, BURKHARD CHRISTOPH, COUNT (1683-1767). A Russian general and statesman, born at Neuenhutorf in Oldenburg, Germany. In the War of the Spanish Succession he served as captain of Hessian troops. He became a colonel in the Polish army in 1716,

entered the Russian service in 1721, and six years afterward became general. He was created commander in chief of the Russian army by Peter II in 1727 and in 1732 was made field marshal and president of the War Council. He superintended the work on the Ladoga Canal and played a distinguished part in the war with Turkey, overran the Crimea in 1736, and, advancing beyond the Dniester, made himself master of Moldavia. After the death of the Empress Anna Ivanovna in 1740, he opposed the party of Biron, the Regent, whom he overthrew. The regency was conferred on Anna Karlovna, mother of Ivan, the young heir to the throne, and Munnich became chief Minister and the most powerful man in Russia. After the coup d'état which placed Elizabeth Petrovna on the throne (1741), Munnich was arrested, and the sentence of death passed upon him was changed only at the foot of the scaffold to exile in Siberia, where he remained for 20 years. Peter III restored to him his estates in 1762, and he was made director general of the Baltic ports by the Empress Catharine. Munnich's *Diaries* have been variously published, notably by Herrmann (Leipzig, 1843). Consult G. A. Halem, *Geschichte des Feldmarschalls Grafen Munnich* (new ed., Oldenburg, 1838); the Russian biography by N. Kostomarov (St. Petersburg, 1884); the *Memoirs* of Munnich's son, Ernest, edited by Arved Jurgensohn (Stuttgart, 1896); Jansen, *Nordwestdeutsche Studien* (Berlin, 1904).

MUNOZ, mōw'nyōth, JUAN BAUTISTA (1745-99). A Spanish historian, born at Museros, Valencia, and educated at the University of Valencia. His leading work was *Historia del nuevo mundo* (1793), which Charles III had commissioned him to write. It follows the course of American discovery down to 1500. The council of the Indies, to which he had been appointed cosmographer (1770), forbade its publication, but Charles IV sanctioned it, despite the author's revelations concerning the atrocious treatment of the aborigines by Spaniards in the New World. Some writings of Muñoz are to be found in the collections of the Academy of History, Madrid, but many of his manuscripts were burned in the library of Valencia when that city was stormed by the French (1812).

MUNRO, mūn-rō', DANA CARLETON (1866-) An American historian, brother of Wilfred Harold Munro, born at Bristol, R. I. He was educated at Brown University (A. M., 1890) and at the universities of Strassburg and Freiburg (1889-90). He was instructor and assistant professor of Roman and mediæval history at the University of Pennsylvania from 1893 to 1902 and then professor of European history at the University of Wisconsin until 1915, when he accepted a chair at Princeton. In 1904-06 also he directed the summer sessions of the University of Wisconsin. From Brown he received the degree of L. H. D. in 1912. He served as editor of *Translations and Reprints from the Original Sources of History* (1894-1902); was author of *A Syllabus of Mediæval History* (7th ed., 1913), *A History of the Middle Ages* (1902), and *A Source Book of Roman History* (1904); coauthor of *Mediæval Civilization* (1904, 1906) and *Essays on the Crusades* (1902), and editor of the department of mediæval history for the NEW INTERNATIONAL ENCYCLOPÆDIA.

MUNRO, DAVID ALEXANDER (1845-1910). An American editor and Greek scholar. He was born at Maryburgh, Scotland, and graduated M. A. from the University of Edinburgh in 1872. Subsequently he came to New York City, where he was employed in the literary department of Harper and Brothers. He edited *Garden and Forest* in 1887-89, and then became connected with the *North American Review*, of which he was general manager in 1889-96, editor in 1896-99, and thereafter assistant editor until his death. He supervised the American contributions to an edition of *Liddell and Scott's Greek Lexicon*, arranged the comparative *Greek-English New Testament* for Harper and Brothers, and collaborated on Dr. Schaff's *Companion to the Study of the Greek New Testament*.

MUNRO, HUGH ANDREW JOHNSTONE (1819-85). An eminent English classical scholar. He was born in Elgin, Scotland, was educated at Shrewsbury School, under B. H. Kennedy (q. v.), and at Trinity College, Cambridge. From 1869 to 1872 he served as the first university professor of Latin at Cambridge. His edition of *Lucretius* (1864, 4th ed., 1885), with commentary and prose translation, remains one of the standard English contributions to Latin scholarship. His edition of *Horace* (1868), containing a valuable introduction and illustrations from ancient gems (selected by C. W. King), and his *Criticisms and Elucidations of Catullus* (1878, 2d ed., 1905) are also highly esteemed. Munro contributed to the *Journal of Philology* and other learned periodicals, on Greek subjects (*Aristotle*, *Euripides*), as well as Latin, and wrote much Greek and Latin verse, to be found in the volume known as *Sabrina Corolla*, published by B. H. Kennedy, and *Translations into Greek and Latin Verse* (1884). Consult J. E. Sandys, *A History of Classical Scholarship*, vol. III (Cambridge, 1908), and J. D. Duff, in preface to a new edition of Munro's translation of *Lucretius* (Bohn Classical Library, London, 1908).

MUNRO, NEIL (1864-). A Scottish novelist, born at Inveraray, Argyllshire, and educated at the parish school. Subsequently he entered the office of the *Glasgow Evening News*. The author of tales and romances dealing with life in the Scottish Highlands, Munro received the degree of LL. D. from Glasgow University. His writings include *The Lost Pibroch* (1896), *John Splendid* (1898), *Gaban, the Dreamer* (1899), *Doom Castle* (1901), *Children of the Tempest* (1903), *The Clyde* (1907), *Fancy Farm* (1910), *Ayrshire Idylls* (1913), *The New Road* (1914).

MUNRO, or **MONRO**, ROBERT (?-c.1680). A Scottish soldier. Between 1626 and 1638 he served in continental wars under the King of Denmark and under Gustavus Adolphus. He then joined his countrymen in their rebellion against Charles I. In 1642 he had charge of an expedition against the Catholic rebels in Ireland. When the Civil War broke out the English Parliament in 1644 placed Munro in command of the Parliamentarians in Ulster. He captured Belfast in that year, but in 1646 was routed in the battle of Benburb by the Irish leader, Col. Owen Roe O'Neill. When Ormonde, Charles's lieutenant general in Ireland, made peace with Parliament, Munro and his Scottish followers refused to surrender Carrickfergus and Belfast and to return to Scot-

land. Thereupon Munro was taken prisoner by Monk in 1648, was confined in the Tower of London for five years, and thereafter lived on his wife's estates in Ireland.

MUNRO, ROBERT (1835-). A Scottish anthropologist and archaeologist. He was born in Ross-shire and was educated at the University of Edinburgh, studying medicine. He was a practicing physician at Kilmarnock until 1886, after which he devoted himself entirely to prehistoric archaeology. He was lecturer on archaeology in 1888 and 1910 at Glasgow and on anthropology at Edinburgh in 1911, and from 1888 to 1899 was secretary of the Society of Antiquaries of Scotland. At Edinburgh he founded the Munro lectureship on anthropology and prehistoric archaeology. Munro wrote: *Ancient Scottish Lake-Dwellings or Crannogs* (1882); *The Lake-Dwellings of Europe* (1890, in French, 1908), *Rambles and Studies in Bosnia-Herzegovina and Dalmatia* (1895, 2d ed., 1900), *Prehistoric Problems* (1897), *Prehistoric Scotland* (1899), *Man as Artist and Sportsman in the Paleolithic Period* (1904); *Munro Lectures Paleolithic Man* (1912, delivered 1911 at Edinburgh); *Prehistoric Britain* (1914).

MUNRO, SIR THOMAS (1761-1827) A British soldier and administrator. He was born in Glasgow and was educated at the university there. Having decided to enter the service of the East India Company, he went to Madras in 1780, but was soon compelled to serve in the campaign against Hyder Ali (q.v.). After further military service, chiefly under Lord Cornwallis, Munro had his first experience as an administrator, though in a subordinate position, in Baramahal, a district ceded in 1792 by Tipu Sahib (q.v.), son of Hyder Ali. His sound judgment, together with his attentive sympathy with the natives, was shown in a number of reforms which ultimately were adopted throughout a large part of British India. Chief among these was the ryotwar land tenure, providing for small holdings from the government by paying a land tax. Another test of his ability was found as administrator successively of the Canara, Ballari, Cuddapah, and Karnul districts, and the Palnad. He put down rebellion, suppressed crime and extortion, and applied his enlightened ideas with vigor and success. His sound views as to the larger policy by which the East India Company could maintain its power while governing with justice brought him into close consultation with the authorities in London, to which he returned in 1807, remaining there seven years. Again, in 1814, he went to Madras for the purpose of organizing a judicial and police system. He took part in the second Mahratta war, after which he went once more to England, returning in 1819 as governor of Madras. This position he held until 1826. Consult John Bradshaw, *Life of Sir Thomas Munro*, in the "Rulers of India Series" (London, 1894).

MUNRO, WILFRED HAROLD (1849-). An American historian, brother of Dana C. Munro. He was born at Bristol, R. I., and was educated at Brown University (A.B., 1870; A.M., 1873) and at Freiburg and Heidelberg. He was a master (1870-71) and president (1881-89) of De Veaux College at Niagara Falls, N. Y.; associate principal of St. Mark's School at Salt Lake City (1871); spent 1873 in South and Central America; and in 1875-79 served as

principal of the Le Roy (N. Y.) Academic Institute. At Brown he was associate professor of history and director of university extension in 1891-99, and professor of European history from 1899 until his retirement in 1911. He is author of *The History of Bristol, R. I.* (1880), *Picturesque Rhode Island* (1881); *The Most Successful American Privateer* (1913); *Some Legends of Mount Hope* (1915); and is editor of *Works of W. H. Prescott* (22 vols., 1905-06) and *Record Book of the Rhode Island Society of Mayflower Descendants* (1911).

MUNRO, WILLIAM BENNETT (1875-). An American authority on municipal government. He was born at Almonte, Ontario, Canada, and was educated at Queen's University, Kingston (B.A., 1895, M.A., 1896), Edinburgh (LL.B., 1898), Harvard (Ph.D., 1900), and Berlin (1900-01). He was instructor in history and political science at Williams College in 1901-04, and at Harvard he served as instructor in government in 1904-06, as assistant professor in 1906-12, and thereafter as professor of municipal government. He became president of the Harvard Cooperative Society, university editor of the *Harvard Graduates' Magazine*, and associate editor of the *American Political Science Review*. He is author of *Canada and British North America* (1904), *The Seigneurial System in Canada* (1907), *Documents Relating to the Seigneurial Tenure* (1908); *The Government of European Cities* (1909), *Initiative, Referendum, and Recall* (1911); *Government of American Cities* (1912; new ed., 1913).

MUNROE, mün-rō', CHARLES EDWARD (1849-). An American chemist and educator. He was born at Cambridge, Mass., graduated from the Lawrence Scientific School (Harvard) in 1871, and in the same year became assistant in chemistry. From 1874 to 1886 he was professor of chemistry at the United States Naval Academy, and then devoted himself to the study of explosives. In 1886 he was appointed chemist to the torpedo corps at Newport, R. I., and in 1892 received a chair in chemistry and the post of senior dean in Columbian (now George Washington) University. He served as president of the American Chemical Society in 1898, and was special agent of the United States Census Bureau in 1900, 1905, and 1910. Munroe invented a smokeless powder, and attained a reputation as an authority on explosives. His publications include: *An Index to the Literature of Explosives* (1886), *Lectures on Chemistry and Explosives* (1888), *A Primer on Explosives for Coal Miners* (1900, 1911).

MUNROE, HENRY SMITH (1850-). An American mining engineer. He was born in Brooklyn and was educated at Columbia University (M.E., 1869; Ph.D., 1877). He served as an assistant geologist of the Ohio State Geological Survey in 1870-71 and as assistant chemist of the United States Department of Agriculture in 1870-72, participated in a geological survey of Yezo, Japan, in 1872-75; and was professor of geology and mining at the University of Tokyo in 1875-76. At Columbia he was adjunct professor of surveying and practical mining in 1877-91 and professor of mining until his retirement in 1915, a member of the university council after 1895, and dean of the faculty of applied sciences in 1897-99. He was president of the Mining and Metallurgical Society of America in 1908-09 and of the

Society for the Promotion of Engineering Education in 1909

MUNROE, KIRK (1850-). An American writer of books for boys, born near Prairie du Chien, Wis. He studied civil engineering at Harvard and while professionally engaged on the routes of the Northern and the Southern Pacific railways gained material for many of his tales. Afterward he worked for various newspapers in New York City, and was the first editor of *Harper's Round Table* (1879-82). After his marriage to a daughter of Amelia Barr, the novelist, he went to reside in southern Florida, a district that often colored his writings, which include: *The Flamingo Feather* (1887), *Dorymates* (1889, new ed., 1903); *Cab and Caboose* (1892, new ed., 1913), *Canoemates* (1892; new ed., 1903), *Raftmates* (1893, 1903), *The Fur Seal's Tooth* (1893), *At War with Pontiac* (1895), *With Crockett and Bowie* (1897); *Under the Great Bear* (1900), *The Belt of Seven Totems* (1901), *The Outcast Warrior* (1905), *For the Mikado* (1906).

MUN'SEE. A subtribe of the Delaware (qv), originally constituting one of the three great divisions of that tribe and dwelling along the upper streams of the Delaware River and the adjacent country in New York, New Jersey, and Pennsylvania. They were considered the most warlike portion of the tribe and assumed the leadership in war councils. From their principal totem they were frequently called the Wolf tribe of the Delaware. They were prominent in the early history of New York and New Jersey, being among the first tribes of that region to meet the whites. By a noted fraudulent treaty known as the Walking Purchase, the main body was forced to remove from the Delaware River about the year 1740. They settled on the Susquehanna, on lands assigned them by the Iroquois, but soon afterward moved westward and joined the main Delaware tribe on the Ohio River, with whom the greater portion eventually became incorporated. A considerable body, who were converted by the Moravian missionaries, drew off from the rest and formed a separate organization, most of them removing to Canada during the Revolution. Others joined the Ojibwa and Stockbridge Indians. The majority were incorporated in the Delaware, with whom they participated in their subsequent wars and removals. Those who still keep the name of Munsee are in three bands, two of which are consolidated with other tribal fragments, so that no separate census is available. These tribes are the Munsees of the Thames, Ontario, Canada; Munsee (or Christian) and Chippewa, northeastern Kansas, and Stockbridge and Munsee, Green Bay Agency, Wis. According to the census of 1910 there are 71 in the United States.

MUNSELL, mün'sel, JOEL (1808-80). An American editor, publisher, and antiquary, born at Northfield, Mass. He settled in Albany, N. Y., in 1827, as a printer, and passed from that occupation to journalism. He subsequently became the editor of various publications, among which were the *New York State Mechanic*, the *Lady's Magazine*, and the *New England Historical and Genealogical Register*. He rendered valuable services to the cause of American history by publishing the *Annals of Albany* (10 vols., 1849-59), *Collections on the History of Albany* (4 vols., 1855-57); and a series of books, some of considerable value known as the

"Munsell Historical Series." The owner of a very large collection of books on the history of printing in the United States, Munsell wrote *Outlines of the History of Printing* (1839) and *A Chronology of Paper and Paper-Making* (1856; 3d ed., 1876).

MUNSEY, mün'si, FRANK ANDREW (1854-) An American publisher, born at Mercer, Me. In 1882 he established at New York City the *Golden Argosy*, afterward changed to the *Argosy*. In 1889 he founded *Munsey's Weekly*, which he changed to the monthly *Munsey's Magazine* in 1891. The last-named periodical was the pioneer among ten-cent magazines. He also founded the *Puritan* and the *Junior Munsey*, and some time after purchased the *Washington Times* (1901), the *New York Daily News*, which he conducted from 1901 to 1904; the *Boston Journal* (1902); the *Baltimore News*; the *Philadelphia Evening Times*, which was discontinued in 1914, and the *New York Press*. He became publisher also of the *All-Story Magazine*, the *Scrap Book*, the *Cavalier*, the *Railroad*, and *Current Mechanics*. When the new Progressive party was organized in 1912 Munsey became one of its most ardent supporters and one of the largest contributors to its campaign expenses. He is author of *Afloat in a Great City* (1887), *The Boy Broker* (1888); *Under Fire* (1890); *Derringforth* (1894).

MUNSON, mün'son, JAMES EUGENE (1835-1906). An American inventor, born at Paris, Oneida Co., N. Y. He studied for a time at Amherst, then removed to New York City, where he became a court stenographer, a position which he held for more than 30 years. He formulated the Munson system of stenography and invented an automatic typesetting machine and a mechanism for operating typewriting machines by telegraph. His publications include: *Complete Phonographer* (1866; rev. ed., 1894), *Dictionary of Practical Phonography* (1874, 2d ed., 1906), *The Phrase-Book of Practical Phonography* (1889), *Phonographic Dictation Book* (1904); *A Shorter Course in Munson Phonography* (1901; 2d ed., rev., 1912).

MUNSTER, mün'ster. The capital of the Prussian Province of Westphalia, situated in a level district on the Aa and on the Dortmund-Ems Canal, 65 miles northeast of Düsseldorf (Map Germany, B 3). The town is mediæval in appearance, with its ancient gabled buildings, old Renaissance houses, rococo dwellings of the eighteenth century, arcaded markets, and shaded allées. The site of the former fortifications, which divided the old and new towns, has been converted long since into promenades. Munster has many churches, of which two are prominent—St. Lambert's and the cathedral. The former is a graceful, pleasing structure. It is Gothic, dates from the fourteenth century, has been restored in recent times (since 1868), and possesses a majestic new tower 312 feet high. The church is associated with the history of the Anabaptists in the sixteenth century. The cathedral (thirteenth century) is a striking edifice, but disfigured with modern decorations. The imposing Gothic church of Our Lady (c.1340) also merits mention as well as the beautiful Romanesque tower of St. Ludger's (1170).

The Rathaus is a handsome, gabled, fourteenth-century Gothic structure. The Peace of Westphalia was signed in it in 1648, in a curious room called the *Friedensaal*, which con-

tains portraits said to have been painted by Terburg. Among the interesting old buildings are also the Renaissance Weigh House; the Renaissance Stadtkeller, the headquarters of the Kunstverein, with pictures of minor value; and the Schuhhaus, or the ancient guildhall of shoemakers. The castle (1767) was formerly the episcopal residence and is now occupied by civil officials. In its grounds is a botanical garden. The government offices, the law courts, and the attractive Gothic post office are modern. The modern Ludgerus Fountain is adorned with interesting religious statues. The Roman Catholic university, which ceased to exist as such in 1818, when the institution was reduced to a theological and a philosophical faculty (which figured as the Academy of Munster from 1843), was revived in 1902 by the establishment of a faculty of law. (See MUNSTER, UNIVERSITY OF.) Other educational institutions include three Gymnasien, a Realgymnasium, a Realschule, etc. Noteworthy also are the royal pedagogical seminary, a seminary for priests, a museum of Christian art. There is a notable zoological garden, which is much frequented by the citizens and contains an antiquarian collection. The industrial products of Munster include leather, linen and cotton fabrics, starch, thread, and sugar. There are also carriage works, breweries, and distilleries. A large trade is carried on in the produce of the country. The population in 1871 was 24,815, in 1901, 63,776, in 1903 certain suburbs were annexed to the commune, so that the 1905 census showed 81,439 inhabitants, of whom 58,632 were returned as Roman Catholic and 10,711 as Evangelical; the 1910 census disclosed a population of 90,254.

History. Munster had its origin in a celebrated monastery which appears as early as the time of Charles the Great. A considerable settlement sprang up around the monastery in the first part of the twelfth century. The town received municipal rights about 1180, and in the course of many years the inhabitants succeeded in vindicating their liberties as against their feudal lords, the bishops of Munster. In the thirteenth century Munster entered the Hanseatic League. In the fifteenth century it became a centre of learning and religious life, and during the Reformation suffered greatly from the strife of parties. In 1533 Munster fell into the power of the Anabaptists, whose leader, the celebrated John of Leyden (q.v.), erected the city into a kingdom of Zion with himself as sovereign (1534). The city was taken by the Bishop in the following year, and John of Leyden was put to death. Against the ambitious and warlike Bernhard of Galen, Bishop of Münster, the city carried on a desperate struggle in defense of its rights, but it was finally compelled to submit with the loss of almost all its liberties (1661). The bishopric of Munster, which held a prominent place among the ecclesiastical states of the old German Empire and embraced a territory of nearly 4000 square miles, was secularized in 1803.

MUNSTER, mün'stēr. The largest of the four provinces of Ireland, occupying the southwest part of that country and bounded north by Connaught, east by Leinster, and west and south by the Atlantic (Map: Ireland, C 7). It contains the six counties of Clare, Cork, Kerry, Limerick, Tipperary, and Waterford. Area, 9532 square miles. Pop., 1841, 2,404,460; 1901,

1,076,188; 1911, 1,035,495, almost entirely Roman Catholics.

MÜNSTER, SEBASTIAN (1489-1552). A German theologian and geographer. He was born at Ingelheim, studied at Heidelberg and Tübingen, and in 1529 left the Catholic church for the Reformed. He was professor of theology and Hebrew at Heidelberg until 1536, when he became professor of mathematics at Basel. He edited in 1534-35 the first Hebrew Bible to appear under the care of a German. But his chief work was his *Cosmographia* (1544), a geography which was translated into Italian, French, and Latin, and passed through 24 editions in 100 years.

MÜNSTER, mün'stēr, UNIVERSITY OF. One of the more recently established Prussian universities, although historically it is connected with numerous efforts to establish such an institution in Munster. The Jesuits conducted there in 1588 the Gymnasium Paulinum, and university privileges were obtained from the Pope in 1629 and from the Emperor in 1631, without, however, much result. Another papal bull was obtained in 1773, but war and lack of endowments prevented any advance, which was further delayed by the establishment of the University of Bonn in 1808. An Akademische Leihanstalt was maintained at Munster, with chairs in law and theology (Catholic). New chairs were added from time to time after 1875, together with museums, laboratories, and other equipment. In 1900 funds were raised by the city and the Province of Westphalia. In 1902 the faculties of theology, philosophy, and law and political science were given the rank of university, which in 1907 received the title of the Westfälische Wilhelms-Universität. A complete medical faculty has not yet been established, but five semesters of medical work are provided. The enrollment in 1913 was 2356. The university library contains 224,709 volumes, about 175,000 pamphlets, as well as a large number of incunabula and manuscripts.

MÜNSTERBERG, mün'stēr-bērk, HUGO (1863-1916). A German-American psychologist, born in Danzig. He received the degree of Ph.D. at Leipzig in 1885 and that of M.D. at Heidelberg two years afterward and taught psychology at Freiburg for five years (1887-92). In 1892 he became professor of psychology and director of the psychological laboratories at Harvard University. In 1910-11 he was Harvard exchange professor at the University of Berlin. Munsterberg served as president of the American Psychological Association (1898) and as vice president of the International Congress of Arts and Sciences (St. Louis, 1904) and of the International Philosophical Congress (Heidelberg, 1908). Munsterberg was the organizer and first director of the Amerika-Institut of the German Government (1910-11) and became a fellow of the American Academy of Arts and Sciences. His early interests were mainly in the field of physiological psychology, but in later years he devoted himself in part to problems of idealistic philosophy and in part to the application of psychological laws to the problems of everyday life. As a result of the latter interest he published a number of books in popular style dealing with the psychology of testimony, of medicine, of education, etc., and he finally undertook a systematic treatment of applied psychology under the name

of psycho-technics. His more important publications are: *Die Willenshandlung* (1888); *Gedankenübertragung* (1889); *Der Ursprung der Sittlichkeit* (1889); *Beiträge zur experimentellen Psychologie* (1891); *Psychology and Life* (1899); *Grundzüge der Psychologie* (1900); *American Traits* (1901); *The Americans* (1904); *Eternal Life* (1905); *Science and Idealism* (1906); *On the Witness Stand* (1907); *Psychotherapy* (1908); *Philosophie der Werte* (1908); *The Eternal Values* (1909); *Psychology and the Teacher* (1909); *American Problems* (1910); *Psychology and Industrial Efficiency* (1912); *American Patriotism* (1913); *Grundzüge der Psychotechnik* (1914); *Psychology, General and Applied* (1914); *The War and America* (1914); *The Peace and America* (1915). After 1903 Münsterberg edited the *Harvard Psychological Studies*.

MÜNSTER-LEDENBURG, mün'stär-lä'den-burk, ERNST FRIEDRICH HERBERT, COUNT ZU (1766-1839). A Hanoverian statesman. He was born at Osnabrück, studied at Göttingen, and in 1788 entered the governmental service of Hanover. For three years (1801-04) he was Ambassador to St. Petersburg, and as Cabinet Minister at London immediately afterward did much to bring about the entente between Russia and England against Napoleon. In 1813-14 he was at the headquarters of the allied forces, and he was a member of the Vienna Congress (1814-15). In Germany his programme was progressive, but anti-Prussian, the constitution of the Kingdom of Hanover and its formation in the midst of Prussia may be considered typical of his policy. In 1831 Münster retired from office. Consult Hornmayer, *L. F. H. Graf Münster* (Jena, 1875).

MÜNSTER-LEDENBURG, (GEORG HERBERT, COUNT ZU, also BARON OF GROFTHAUS and PRINCE OF DERNEBURG (1820-1902). A German diplomat, son of the foregoing, born in London, England. He was educated at Bonn, Heidelberg, and Göttingen, served for a time in the first chamber of the Hanoverian Parliament, and from 1857 to 1865 was Envoy Extraordinary of the Government of Hanover at the court of St. Petersburg. After the annexation of Hanover to Prussia in 1866 he declared himself pro-Prussian, and from 1867 was a member of the Upper House. He represented Goslar in the Diet of the North German Confederation from 1867 to 1870 and in the German Reichstag from 1871 to 1873. He became Ambassador at London in 1873, at Paris in 1885, and in 1900 retired from the diplomatic service. In 1899 he was a member of the Peace Conference at The Hague. He wrote several works on contemporary German and continental public affairs, including *Politische Skizzen über die Lage Europas vom Wiener Kongress bis zur Gegenwart* (1867) and *Der norddeutsche Bund und dessen Übergang zu einem deutschen Reiche* (2d ed., 1868).

MUNTANER, mōōn'tā-nār', EN RAMÓN (1265-1336). A Spanish chronicler, born at Peralada in Catalonia. He became a wandering soldier and minstrel and for 30 years led an adventurous life, serving with Roger de Flor in Sicily (1300), with the celebrated Almogávares against Asia Minor, and becoming Governor of Gallipoli and later of Jerba. Returning to Catalonia, he began in 1325 to write in Catalan the history of the princes of Aragon from the time of James the Conqueror to the coronation

of Alfonso IV. This chronicle of great events, of which he was an eyewitness, is valuable for the history of his time and is remarkable for its accuracy. It remained in manuscript until the middle of the sixteenth century. The most ancient editions of the original are those of Valencia (1558) and Barcelona (1562). The former is entitled *Chronica o descriptio dels fets e hazanyes del inclyt Rey Don Jaume Primer . . . c de molts de sos descendens*, etc. It has been translated into German, Italian, and French. Karl Lanz published an edition of the original in 1844, *Chronik des edlen En Ramon Muntaner* (vol. viii, Bibliothek des literarischen Vereins in Stuttgart, 1844). Consult also the edition by A. de Bofarull (Barcelona, 1860).

MUNTHE, mūn'te, GERHARD PETER FRANTS WILHELM (1849-) A Norwegian decorative painter and illustrator, born in Elverum. He was educated in Christiania, Düsseldorf, Munich, and Paris. Returning home (1883) as a pronounced realist, he painted the brilliant "Haymaking" (1884), "The Peasant's Garden" (1886), and "From Eggedal" (1888), all in Christiania Gallery. As a result of his studies of Old Norse art he exhibited in 1893 "Eleven Fantasies Illustrating Norwegian Fairy Tales," decorative water colors, among which are "Afraid in the Dark," "The Lovers," and "The Horse of the Goddess Hel." These were reproduced in tapestry and became very popular. In the Royal Castle, Christiania, hang his "State-Tapestries" ("The Golden Portal," "King Sigurd and Baldur"). Munthe decorated residences, art institutions, and King Haakon's Hall, Bergen, and illustrated, among other books, Snorri's *Saga* "From Nitedal" (1905, Christiania Gallery) and "Bergen from Floisfjeldet" are representative of his later landscapes.

MUNTHE, LUDVIG (1841-96). A Norwegian landscape painter, born at Aaroen, near Bergen. He was first given instruction by Schiertz, a German painter and architect at Bergen, and then became a pupil of Flamm at Düsseldorf, which he subsequently selected for his permanent residence. A thoroughly realistic treatment characterizes his paintings, of which autumn and winter scenes in stormy or gloomy weather, forest and coast views form the prevailing subjects, and which may be judged by such specimens as a "Pine Forest in Winter" (1870), Hamburg Gallery; "Wood Interior in Winter, with Stags" (1878), National Gallery, Christiania, which was awarded the gold medal in Paris, "Birch Wood in Autumn" (1886) and "Autumn in Holland" (1895), both in National Gallery, Berlin. He was appointed Swedish court painter and Prussian professor.

MUNTJAC (Javanese name). Any of a genus (*Cervulus*) of small Oriental deer which dwell solitarily in the jungle and whose young are spotted. The species best known is that of India, called barking deer by Anglo-Indian sportsmen, or kakar (*Cervulus muntjac*) by the Hindustani. It is a little larger than a roebuck. Its lyrate antlers are peculiar in that they rise from pedicels about 5 inches high, or as long as the antler itself, and have only one short basal spur. The female has no antlers, nor has she the great exposed upper canine tusks, which, like those of the musk, are the effective weapons of the bucks in their fights. Allied species, some with smaller horns, are found in China and the Malayan islands, and an interesting fossil genus (*Amphitragulus*), in-

habiting Tertiary Europe, was totally hornless in both sexes. See Plate of FALLOW DEER, MUSK, ETC., with the article DEER.

THE INDIAN MUNTJAC

MÜNTZ, *myn̄ts*, CHARLES ACHILLE (1846-). A French agricultural chemist, brother of Eugène Muntz. He was born at Sulz, Alsace, studied under Boussingault at Paris, and after acting as his assistant for 10 years, succeeded him as director of the chemical laboratories of the Institut National Agronomique. Muntz became a member of the Institute of France. The reports of his investigations, published largely in *Annales de l'Institut National Agronomique*, *Annales Agronomiques*, *Annales de la Science Agronomique*, and *Comptes Rendus de l'Académie des Sciences*, include important contributions to such diverse subjects as nitrification; soils, fertilizers, and plant nutrition; foods, feeds, and animal nutrition; viniculture; irrigation, and sewage purification and utilization in agriculture. Muntz was associated with Schloosing in some of the earliest work on nitrification, and together they were the first (1877) to establish by experiment the true nature of nitrification, viz., that it is a biological rather than a purely chemical process. He made feeding experiments with large numbers of cattle and horses, and vinicultural experiments in a large number of vineyards, publishing important reports on these subjects (*Recherches sur l'alimentation des chevaux*, with Girard, 1884, and *Les vignes*, 1895). With Girard he is the joint author of a large treatise on fertilizers, *Les engrais* (1888-91). Other subjects upon which Muntz and his associates published notable reports are the effect of late irrigation on grapes (1899), agricultural value of the soils of Madagascar (1901), nitre and the national defense (1905), intensive nitrification and high-yielding nitre beds (1907), diffusion of fertilizer salts in the soil (1908), purification of sewage by means of peat beds (1909).

MÜNTZ, EUGÈNE (1845-1902). A French art critic, brother of Charles Achille Muntz, born at Sulz, Alsace. He took Taine's place as professor of the history of art at the Ecole Nationale des Beaux-Arts, where he lectured from 1885 to 1893 and filled other important positions. One of the first in France to treat the history of art as a science, he made a specialty of Italian art, and the following works are of unique value *Notes sur les mosaïques de l'Italie* (1874-92) *Les arts à la cour des*

papes pendant le XVème et le XVIème siècle (1878-98); *Raphaël* (1881, revised, 1885; new ed., 1900, Eng. ed., London, 1882); *Les précurseurs de la Renaissance* (1881); *Histoire de la tapisserie* (1882; 5th ed., 1903); *Etudes sur l'histoire de la peinture et de l'iconographie chrétienne* (1882); *Histoire de l'art pendant la Renaissance* (3 vols., 1888-95); *Léonard de Vinci* (1899), *Pétrarque* (1901). He also contributed important articles to the *Gazette des Beaux-Arts* and other periodicals, and was a member of both the Academy and the Superior Council of the Fine Arts.

MÜNZER, *myn̄ts̄er*, THOMAS (c.1489-1525). A religious enthusiast, communist, and popular leader of the German Reformation, born at Stolberg in the Harz Mountains. He acquired a good knowledge of theology, taught at Aschersleben and Halle, became in 1519 chaplain of a nunnery at Beutwitz, and in the following year received a call as preacher to Zwickau. There he gained great popularity by his attacks on the monastic and mendicant orders. In 1521 he was compelled to leave the town, and went to Bohemia, where his preaching, however, met with little sympathy. In 1523 he became pastor at Allstedt in Thuringia, married a nun who had abjured her vows, and carried on his pastoral work in full sympathy with the advanced representatives of the Reformation. He was an ardent champion of German nationality, and was the first to substitute German for Latin in the liturgy. He stood in close touch with Carlstadt and shared the latter's radical ideas. In time he developed a fanatic mysticism whose chief tenet was the validity of inner revelation, and he attacked as "new papists" those reformers who set up the gospel above personal justification. His ideas partook also of a political and social nature, he preached the speedy coming of God's kingdom on earth, and sought to organize the peasants and the artisans of the towns into secret associations looking, it is asserted, to the destruction of all authority and the establishment of communal property. In August, 1524, he was expelled from Allstedt and betook himself to Mühlhausen, where he joined forces with Heinrich Pfeifer, a renegade monk, who had succeeded in gaining great influence over the lower classes. Together they were driven from the city in September, and Münzer wandered through southern Germany and Switzerland, forming close relations with the Anabaptist leaders and hastening in no small degree the peasant uprising in those regions. He returned to Mühlhausen in December and, with Pfeifer, who had likewise reentered the city, assumed leadership of the discontented masses. The old council was overthrown and a new council was installed under the control of Münzer. Mühlhausen speedily became the centre of a violent agitation. The opposition of the nobles was ineffectual, but at Frankenhausen, on May 15, 1525, Münzer's peasant mob was almost annihilated by the force of Philip of Hesse, the Elector of Saxony, and the Duke of Brunswick. (See PEASANT WAR.) Münzer escaped from the battlefield, but was captured at Frankenhausen and taken to the castle of Heldrungen, where he was put to the torture. On May 25 he was decapitated at Mühlhausen, together with Pfeifer and 24 other leaders of the peasants. Fanatic though he undoubtedly was, there is nothing to disprove Münzer's warm love for the common people, whose cause

he upheld against Luther, accusing the latter of fawning on the German princes while seeking to appease the peasants with empty words about the responsibility of rulers to God. Consult: Strobel, *Leben, Schriften und Lehren Thomas Münzers* (Nuremberg, 1795); Seidemann, *Thomas Münzer* (Dresden, 1842); also critical bibliography and article by Alfred Stern in *Allgemeine deutsche Biographie*, vol. xxiii (Leipzig, 1886); O. Meiz, *Thomas Münzer und Heinrich Pfeuffer* (Göttingen, 1889); J. S. Schapiro, *Social Reform and the Reformation* (New York, 1909).

MUNZINGER, mún'tsing-ēr, WERNER (1832-75) A Swiss traveler and linguist. He was born at Olten, was educated at Bern, Munich, and Paris, and in 1852-53 was connected with a mercantile establishment at Alexandria, Egypt. He was attached to the expedition of Von Heuglin in 1861, but quitted it when it reached north Abyssinia, and in company with Kinzelbach explored an unknown territory. In 1862 he was placed at the head of the German exploring expedition, succeeding Heuglin, but was unable to penetrate farther than Kordofan. In 1865 he was appointed British Consul at Massowah and in the Anglo-Abyssinian War acted as a guide to the English forces, after whose withdrawal he remained at Massowah as Consul in the French service. In 1870 he made a journey to southeast Arabia, and was appointed by the Khedive Governor of Massowah (1871). In 1872 he was made Pasha and Governor-General of the eastern Sudan, and in 1875 was mortally wounded while leading an expedition against Abyssinia. He published *Sitten und Recht der Bogos* (1859), *Ostafrikanische Studien* (1864, 2d ed., 1883), *Vocabulaire de la langue Tigré* (1865), *Die deutsche Expedition in Ostafrika* (1865).

MUONGS, mōō'ngz. A people who, together with the Thos, also dwelling in northeastern Tonkin and Annam and the adjoining parts of China, constitute, in the opinion of some leading anthropologists, one of the four chief groups of the Tai stock, of which the Siamese are the best-known members. The Farther Indian Muongs inhabit the basin of the Black River, and the Thos that of the Claire, while the great mass of the primitive population of the Chinese provinces of Kwangsi, southern Kweichow, northwestern Kwangtung, eastern Yunnan, and perhaps also the Le of the island of Hainan, belong in this group of primitive Tai peoples. The Pueun and Pu-tai of Annamese Laos closely resemble in physical characteristics and language the Muongs of Tonkin. A number of the Thos-Muongs tribes have methods of writing of their own resembling those of the Laotians, and apparently not derived from Chinese, even in the case of the tribes of this group resident in China. Like some others of the primitive population of this part of the world, they impress one as being rather non-Mongolian in physical characters. Their eyes, especially, are often almost straight.

Henry, *Ling-Nam* (ib., 1886); Bourne, *Journey in Southwestern China* (ib., 1888); Alexander Hosie, *Three Years in Western China* (ib., 1890); Frédéric Garcin, *Au Tonkin Un an chez les Muongs* (Paris, 1891).

MURA, mōō'ra. A populous but inferior
VOL. XVI—29

tribe of Tupian stock (q.v.), residing along the Amazon River, Brazil, from the confluence of the Madeira as far as the Purús. They were formerly very formidable and hostile to the Portuguese, but were completely crushed by the Mundurucú (q.v.) in 1788. Since that time some of them have come into the Portuguese settlements for protection and have acquired a rudimentary civilization, but those of the interior and upon the Purús are still in their original savage condition. Their houses, grouped in small villages, are mere roofs supported upon poles, without walls. They do not cultivate the ground, but live upon fish, game, and wild fruits, using bows six feet long, spears, and well-made canoes. They are much addicted to a sort of narcotic snuff prepared from the seeds of a species of mimosa. They were formerly naked, but those near the settlements now wear clothing. They carry on a trade with the Brazilians in sarsaparilla, turtle oil, and Brazil nuts, in exchange for cotton cloth, knives, spear and arrow heads. They are described as lazy, drunken, dishonest, and quarrelsome, and are among the lowest of all the Amazonian tribes.

MURAD, mōō'rād. The name of five Turkish sultans. See AMURATH.

MURADABAD, mōō'rūd-ā-bād', or **MORADABAD**. The capital of a district of the same name, United Provinces, British India, on an elevation on the right bank of the Ramganga, 50 miles northwest of Bareilly (Map India, D 3). Its chief features are the great mosque, built in 1631, an American Methodist mission church, built in 1874, and the Anglican church of St. Paul. The cantonment and civil administrative offices are on the northwest. Muradabad is noted for its engraved brass ware, has cotton factories and many printing establishments. There is an extensive trade in sugar, wheat, rice, and other products of the district. The town is administered by a municipal council of 23 members, 18 of whom are elected. Muradabad was founded by Rustam Khan in 1625. The ruins of his fort, with brick walls from 4 to 6 feet in thickness, overlook the river. Pop., 1901, 75,128; 1911, 81,168.

MURÆNA, mû-rē'na. A fish. See MORAY.

MURAI CHŪZEN, mōō'ri' chōō'zēn'. A Japanese physician and mathematician of the eighteenth century. He wrote the *Kaishō Temper Sampō* (1765), which treated of the solution of numerical higher equations. His *Sampō Dōshi-mon* (1781) is noteworthy because of its treatment of circulating decimals.

MU'RAL CIRCLE. An astronomical instrument formerly used for measuring the declinations of stars. The principle of its construction was somewhat similar to that now used for the meridian circle, by which it has been replaced. See MERIDIAN CIRCLE.

MURAL CROWN. In heraldry, a crown in the form of the top of a circular tower, masoned and embattled, conferred on one who was the first to mount the walls of a besieged city and to set up a standard there.

MURAL DECORATION (from Lat. *muralis*, relating to a wall, from *murus*, OLat. *mærus*, wall). Art applied to the adornment of wall surfaces. Wall painting in fresco, in oils, in encaustic, figured sculpture in low relief, colored or plain, in stone, marble, terra cotta, or stucco mosaic compositions, marble incrustations, and sectile work, and wainscoting in

carved and paneled woodwork, are the principal modes used for the purpose. The term is commonly made to include also, by extension, the decorative treatment of vaults and ceilings, as well as walls. For details, consult the articles on the different varieties of mural decorations: **RELIEF SCULPTURE**; **INLAY**; **FRESCO**; **MOSAIC**; also the general articles **DECORATIVE ART**, **INTERIOR DECORATION**.

Egypt. In ancient Egypt flat undecorated walls were avoided; the internal surfaces of the temples and the external surfaces of pylons and walls were converted into large grouped pictures, deeply incised, and with flat tints, graded according to the light, being delicate in the well-illuminated parts, heavier in the darker apartments. See **EGYPTIAN ART**.

Asia. Babylonia and Assyria had greater variety of method. The walls were often divided horizontally into zones—a lower dado of sculpture, an upper one of painting. The sculpture was either of fine stone partly colored (not entirely, as in Egypt), or of glazed tiles in relief, strongly colored. Though the tones were still flat, more relief was given than in Egypt by the accentuation of outlines and details by heavy dark lines. Gold and other metals and rich hangings increased the strength of the color scheme. The exterior walls were often faced with flat glazed tiles in massed colors, with the same result. See **BABYLONIAN ART**; **ASSYRIAN ART**.

Greece. The pre-Hellenic Greeks seem to have used gypsum and plaster reliefs and wall paintings in similar fashion to the Assyrians, and the Greeks of the historic period at first show signs of Oriental influence in the bright colors applied to gable, frieze, and metope sculptures, without the Oriental appreciation of color harmony. The polychromy of Greek architecture and sculpture gradually, however, gave way to the use of plain sculpture and to a reliance on the play of light and shade by means of projecting moldings and members in place of pure surface decoration. Simplicity of method, reticence of style, plasticity of composition, and delicacy of coloring were their characteristics. Color was subordinated to form, and the decorated surfaces were broken up usually into small units. The predominance of external over internal effects helped to minimize the importance of Greek mural decoration. See **GREEK ART**.

Rome. The Romans returned, with different methods and a different style, to the Oriental and Egyptian idea of colored instead of plastic mural adornment, which received great importance from their development of vast interiors. They adopted three principal media, with increasing heaviness as the Empire advanced—wall painting in fresco, mosaic painting, and marble incrustations. The molding of decorations in low relief in the stucco covering of walls and ceilings may be considered chiefly as an adjunct to the painted decoration. The most characteristic of these three treatments was the use of rich Oriental and African marbles. The interior walls of temples, Imperial *thermæ* and palaces, basilicas, and other buildings were covered to a considerable height in this way, while private houses were generally confined to fresco work. (See **PLATE OF POMPEIIAN MURAL DECORATION**, under **DECORATIVE ART**.) Mural decoration on stucco was often microscopic in scale, small compartments, and small scenes being juxtaposed without much central interest,

and by attempts at perspective effects and different planes the effort was made to counteract the confining effect of the walls of a room; to substitute pictures one could look into for flat decorated surfaces. See **ROMAN ART**.

Early Christian. In early Christian and Byzantine mural decoration one school adopted as its main medium the new method of mosaic wall pictures (see **MOSAIC**), which gave a richer mural color scheme than had ever been known in any style. Casting aside the Roman picturesqueness, this school returned to the Oriental flat effects, but with the addition of glowing gold grounds and the depth given by the colored glass cubes an entire wall often became a single picture instead of an agglomeration of units. The advantage of Byzantine decoration was that the eye was received by and sank into its rich mosaic surfaces instead of being thrown back by shallow fresco coloring. The other school preferred plain or frescoed surfaces, this treatment was common in most of Syria, Asia Minor, north Africa, and Europe. Mural decoration in these regions for long after the decline of Rome was practically extinct where Byzantine influence did not exist. Even in Byzantine art fresco painting tended in many places to displace mosaic. See **CHRISTIAN ART**; **BYZANTINE ART**.

Mohammedan. The earliest special development of mediæval decoration was in the Mohammedan world, and it was one of great interest. It used color very generously, but also sculpture in low relief, its effects were mainly those of tapestry and other stuffs, even when design was in the form of colorless carvings on the outside surface of a dome. Geometric patterns were most prominent, floral forms, and very rarely human figures, characterize Persian art. Glazed tiles were specialties in Persia, geometric mosaics in Egypt, colored stuccoes in Spain. There was but little composition, grouping, or subdivision, the main plan was to cover the surfaces completely with more or less uniformity. There were practically no plain surfaces and no heavy projections. Such necessary projections as pendentives were broken up into minute stalactites. The effects were rich and restful, often even hypnotic. The Oriental races always retained the faculty of harmonious coloring, and used it to the full in mural decoration. Though related to the Byzantine type, this style was far more intricate and less well composed. See **MOHAMMEDAN ART**.

Mediæval. The mediæval decorative mural work in Europe did not begin to take shape until the close of the eleventh century; its usual media were extremely simple, merely fresco painting and sculpture in stone. The multiplicity of styles makes any unity of characterization, such as was possible in previous styles, quite impossible. During the Romanesque epoch polychromy of the walls was common and even large cycles of frescoes were often painted, especially in Germany. In central and southern France the entire exterior façades were often compositions in sculpture; in Tuscany and northern Italy effects of color on the exterior were given by the use of marbles, terra cotta, and brickwork in patterns or courses. In certain regions, such as Sicily, Rome, and Venice, the Byzantine and Oriental rich color scheme, especially in the form of mosaic work, prevailed. When, however, European art became thoroughly nationalized and indigenous

in the Gothic period, Italy took a decided lead in the development of painted mural decoration in fresco which superseded all other methods. The reason for this was that the more logical Gothic art of the North, under French leadership, practically suppressed wall surfaces, and consequently mural decoration, in favor of detached ornamentation in stone, stained glass, and the like, owing to the framework system of Gothic architecture. Italy, almost alone, did not abolish wall surfaces, consequently her painters, like Cimabue and Giotto and their contemporaries and successors, could develop the primitive fresco work of the Romanesque type into a really artistic scheme of mural decoration such as we see at Assisi, Florence, and Siena. Grand figured compositions, harmoniously grouped, were the characteristic of this Italian school. Rich borders sometimes followed, sometimes contrasted with, the architectural lines. Above all, the coloring was light and clear and the effects flat and symbolic, the figures being rather like silhouettes on a flat ground. Sometimes there were also grand exterior effects both of color and form, as at Orvieto. See ROMANESQUE ART, GOTHIC ART.

Renaissance. The Renaissance saw Italy still easily leading in mural decoration from Masaccio to Raphael, the media were even simpler than before, for mosaics were entirely discarded and effects of sculpture and architectural membership less frequent. The climax in the Sistine Chapel and Raphael's Stanza was reached by a perfectly consistent series of steps, some advantageous, such as the abandonment of the heavy architectural frameworks of the Giottoesque period for simpler borders, some were disadvantageous, such as the attempts to do away with flat effects by the introduction of perspective and a variety of planes in both environment and figures. The juggling with perspective and anatomical difficulties indulged in during the fifteenth century by Paolo Uccello, Melozzo, and Mantegna led, in later days, to the extravagances of Correggio, Paolo Veronese, and Tiepolo. It became the main object of painters of the sixteenth century to change the subdivisions of flat mural decoration into a series of realistic framed vistas, and this mistaken realism was emphasized by the use of oil instead of fresco colors, giving effects of atmospheric perspective besides the previously acquired linear perspective. See RENAISSANCE ART.

Modern. During the first half of the nineteenth century mural decoration declined to very low estate. In France, however, the influence of the national school of fine arts and the government patronage of the arts preserved it from extinction, and the domination of classicism and tradition began towards 1840 to yield to a new and fresher spirit, exemplified in the works of Hippolyte Flandrin. The decorative sense is more highly developed in France than elsewhere, and there has risen in France a remarkable school of mural painting, whose influence has been felt throughout the modern world. Modern French decorative painting rejects the flatness and conventional composition of the Italian fourteenth-century artists, inclining rather to the pictorial realism of the developed Renaissance schools, but it recognizes the difference between an easel picture applied to a wall or ceiling, and a decorative painting composed specially for an architectural setting. The most prominent representatives during the

nineteenth century were Hippolyte Flandrin, whose austere religious paintings excel in line; Paul Baudry, decorator of the Grand Opera, a follower of the High Renaissance; and greatest and most original of all mural painters of the nineteenth century, Puvis de Chavannes, who reverted to the flat decorative effects of Giotto.

While Germany did much early in the century to study and revive mural painting, classical tradition tended to stifle originality, and no really great masters of the art have appeared. Cornelius (1783-1867) and Kaulbach (1805-74) made efforts to revive monumental mural painting, especially at Munich and Berlin, but their works lack the real decorative spirit. In England there is little to show in the way of mural painting, the preference there being usually for decoration by architectonic means and conventional ornament. The fine opportunity offered by the extensive frescoes of the Houses of Parliament failed to produce an art of true decorative worth. In Spain the eccentric but powerful genius of Goya (1746-1828) asserted itself in the first third of the last century in ceiling paintings of great merit in Madrid, but he had no successors, and Spain and Italy are equally in arrears in this branch of art. The pioneers of mural painting in the United States were John La Farge, whose important decorative work in Trinity Church, Boston, began in 1876, and William Morris Hunt, whose ceiling panels in the Assembly Hall of the New York State capitol were undertaken shortly afterward. The Columbian Exposition at Chicago in 1893 not only gave extensive opportunity for mural painting, but promoted an active public interest. The well-known achievements of Sargent and Abbey in the Boston Public Library followed shortly afterward. The widest opportunity was offered in the extensive decorations of the Congressional Library, Washington, in which many American painters and sculptors participated. These were followed by similar decorations in the Appellate Court Building, New York, and especially in the State capitols of Minnesota, Iowa, Wisconsin, and Pennsylvania, the Federal Building at Cleveland, and the Court House of Baltimore. Decorations of importance were also completed for many private residences in New York and elsewhere and in some of the churches, notably that of the Paulist Fathers in New York, the interior of which contains a cycle of important subjects painted chiefly by Edward Laurel Harris. Among the painters who have distinguished themselves in mural work are Kenyon Cox, Edwin H. Blashfield, H. O. Rogers, Robert Blum, John W. Alexander, and Violet Oakley, while others like Martland Armstrong and Frederic Crowninshield have adapted themselves rather to the important decorative accessories than to the figure subjects of mural painting. Generally speaking, the productions of the American school are not lacking in technical ability, but are luxurious rather than austere in character and more suited to the ballrooms and salons of hotels and private houses than to the halls of justice, government, and learning.

Modern mural decoration has generally abandoned fresco painting in favor of oil painting on canvas, attached to the wall with white lead. Fresco, tempera, encaustic, and water-glass painting are rarely attempted. Other forms of decoration have been revived and are largely

used, wainscoting, marble incrustation, mosaic, and inlay and stucco relief, and wall hanging in paper, tapestry, stamped leather, and other materials, besides other more purely architectonic methods of adornment, being widely used and with conspicuous success.

Bibliography. No special works have been written upon the general subject, except practical manuals for the use of painters, such as Thomas, *Mural Decorations* (London, 1869), Crowninshield, *Mural Painting* (Boston, 1887), F. H. Jackson, *Mural Painting* (New York, 1904), J. D. Grace, *The Art of Color Decoration* (ib., 1913). For mural painting in America consult the monographs by Pauline King (Boston, 1902) and E. H. Blashfield (New York, 1913).

MURAL PAINTING. See MURAL DECORATION.

MURANO, mōō-ra'nō. A town in the Province of Venice, Italy, on an island in the Venetian lagoon, 1½ miles north of Venice (Map. Italy, G 2). It has the twelfth-century cathedral of San Donato, the basilica of St. Peter, the Martyr, with a painting by Bellini. The town has been, since the thirteenth century, the seat of the Venetian glass industry and contains a museum of glass products. It is a centre for the production of false jewels. Pop. (commune), 1901, 5150; 1911, 5805.

MURAT, mu'ra', JOACHIM (1767-1815). A celebrated French cavalry leader, King of Naples from 1808 to 1815. He was born March 25, 1767, being the son of a well-to-do innkeeper at La-Bastide-Fortunière, near Cahors, in France. He was intended for the priesthood and commenced the study of theology and canon law at Toulouse, but soon enlisted in a cavalry regiment. Being dismissed for insubordination after two years of service, he returned to his home, and later proceeded to Paris, where he obtained admission into the constitutional guard of Louis XVI. On the outbreak of the Revolution he was made a sublieutenant in a cavalry regiment, and a little later aid-de-camp to General Hué. His gallantry and his extreme republicanism soon won him the rank of colonel. He served with distinction under Bonaparte in Italy and Egypt. He finally rose to be general of division (1799), and having returned with Bonaparte from Egypt to France, he rendered most important assistance on the 18th Brumaire, by dispersing the Council of Five Hundred at Saint-Cloud. Bonaparte now intrusted him with the command of the Consular Guard, and gave him his youngest sister, Caroline, in marriage (Jan. 20, 1800). The same year Murat commanded the cavalry at Marengo, and expelled the Neapolitans from the Papal States. In 1803 he was a member of the Corps Législatif, and in 1804 Governor of Paris. On the establishment of the Empire he was loaded with honors, being made a marshal of the Empire (1804), and Prince and Grand Admiral (1805). He continued to command the cavalry in the armies led by the Emperor, contributed to the triumph of the French at Austerlitz, and to other victories by his enthusiasm and commanding appearance as well as by his military talent. In 1806, the newly erected Grand Duchy of Berg (q.v.) was bestowed upon him. After the battle of Jena, in 1806, he led in the pursuit of the Prussians, and in 1807 he participated in the battles of Eylau and Friedland. In 1808 Napoleon placed him in com-

mand of the army in Spain, where in May he suppressed the insurrection in Madrid. Joseph Bonaparte having exchanged the throne of Naples for that of Spain, Murat was made his successor, and on Aug. 1, 1808, was proclaimed King of Naples under the title of Joachim I. He immediately took possession of the Kingdom of Naples, but the Bourbons, through the support of Great Britain, retained Sicily. Murat instituted a number of wise and beneficent reforms, but had to endure the yoke of Napoleon, who left him little but the outward show of royalty. In the Russian campaign of 1812 he commanded the cavalry, but after sharing in the disaster which befell the French army returned to Naples anxious and discontented. He joined the French army again in 1813, and distinguished himself at Dresden, but after the battle of Leipzig withdrew to his own dominions and concluded a treaty with Great Britain and Austria in January, 1814, by which he was guaranteed the possession of his throne on condition of joining the coalition against Napoleon and contributing 30,000 troops to the allied armies. After a pretense of attacking Eugène Beauharnais in Italy, Murat withdrew to Naples and entered into private communication with Napoleon at Elba. On the Emperor's return to France, Murat placed himself at the head of an army of 40,000 men and commenced a war against Austria. He was defeated by the Austrians at Tolentino, May 2-3. Naples was evacuated May 19, and Murat fled to the island of Ischia, and finally found his way to France, while his wife and children took refuge with the British fleet. Napoleon declined to treat with his brother-in-law on any terms and forbade his presence in Paris. Murat then found a refuge near London, and after Waterloo he fled to Corsica. Declining Metternich's offer of an asylum in Austria, he proceeded in a foolhardy manner with a few followers to the coast of Naples and proclaimed himself king and liberator, but was presently taken prisoner, and after trial by a court-martial was shot in a hall of the castle of Pizzo, Oct. 13, 1815.

Johnston, *Napoleonic Empire in Southern Italy* (2 vols., New York, 1904), Chavenon and St. Yves, *Joachim Murat* (Paris, 1905), C. H. L. Johnston, in *Famous Cavalry Leaders* (Boston, 1908), Albert Espitalier, comp., *Napoleon and King Murat, 1808-1815* (New York, 1911), A. H. Atteridge, *Joachim Murat* (ib., 1911).

MURAT, NAPOLEON ACHILLE (1801-47). Eldest son of Joachim Murat, King of Naples. He was born in Paris and for a time bore the title of the Prince Royal of the Two Sicilies; but after the overthrow of his father, in 1815, he sought refuge with his mother in Lower Austria, where he received an excellent education. In 1821 he emigrated to the United States, and after a tour of the country settled near Tallahassee, Fla., where he bought a large estate and built an elegant mansion. When Lafayette revisited the United States in 1825, Murat traveled much with him, and was by him introduced to a grandniece of Washington,

Miss Catharina Dudley, whom he married in 1826. Murat declined numerous offers of a political career, and devoted himself to farming, literary pursuits, and philanthropic undertakings. His literary works include: *Lettres d'un citoyen des États-Unis à un de ses amis d'Europe* (1830); *Esquisse morale et politique des États-Unis* (1832); *Exposition des principes du gouvernement républicain tel qu'il a été perfectionné en Amérique* (1833). These works attracted great attention in Europe. Consult MacConnell, "The Prince and Princess Achille Murat in Florida," in the *Century Magazine* (New York, 1893).

MURAT, NAPOLEON LUCIEN CHARLES, PRINCE (1803-78). The second son of Joachim Murat, King of Naples. He was born in Milan and after the overthrow of his father, in 1815, lived for several years with his mother in Lower Austria. In 1813 he had been made Prince of Ponte Corvo, but escaped to Boston in 1825, and soon after his arrival in the United States he joined his uncle Joseph, who was then living in Philadelphia under the title of the Count of Survilliers. In 1827 he married Miss Georgina Frazer, an heiress, of Bordentown, N. J. His wife later established there a fashionable school for young women. Unlike his brother, Napoléon Achille, he did not give up the idea of recovering his father's throne, and in 1839 and 1844 made trips to France with that purpose in view, but was permitted to remain in France only a short time. After the February revolution of 1848 he returned to France and was elected a deputy to the Constituent Assembly. He was Minister Plenipotentiary to Turin in 1849-50. After the coup d'état of Dec. 2, 1851, he received a seat in the Senate, and was recognized by Napoleon III as a prince of the Imperial family, which brought to him an annual pension of 150,000 francs and secured the payment of two millions of debts. In 1861 he advanced claims to the throne of Naples, but his pretensions were officially disavowed by the French government and came to naught.

MURATORE, my'ra-tōr', LUCIEN (1878-) A French dramatic tenor. He was born at Marseilles, graduated from the conservatory of his native city in 1897, and later studied in Paris. He appeared with Calvé and Dufresne in *La Carmélite* at the Opéra Comique in Paris, where he also sang in *Muquette* and *Le cor fleuri*, and at the Opéra he appeared in *Ariane* and *La Catalane*. Besides singing the rôles of Faust, Romeo, and Walther, he created the leading parts in *Bacchus*, *Le miracle*, *Salomé*, *Siberia*, and *Francesca da Rimini*. During the seasons of 1912-13, 1913-14, and 1915-16 he was a member of the Chicago Grand Opera Company.

MURATORI, mō'ra-tō'rē, LODOVICO ANTONIO (1672-1750). A celebrated Italian antiquary and historian. He was born at Vignola, near Modena, Oct. 21, 1672. He studied theology and history in the University of Modena and early attracted the attention and won the friendship of Father Bacchini, the librarian at the ducal palace, who fostered in him a taste for historical and antiquarian research. In 1688 Muratori took minor orders, and in 1694 obtained the degree of doctor in canon and civil law. The same year he was appointed to the staff of the Ambrosian Library at Milan. While there he published his two collections of previously unedited Greek and Latin fragments

entitled *Anecdota Græca* and *Anecdota Latina* and some poems and essays of a purely literary character. *Della perfetta poesia italiana* (Modena, 1706) and *Riflessioni sopra il buon gusto nella scienze e nelle arti* (Venice, 1708). In 1700 he returned to Modena at the invitation of the Duke, in order to become keeper of the ducal archives and librarian of the Este Library. From 1708 to 1712 he wrote several polemical works in which he defended the right of the Empire to certain Italian territory claimed by the papacy, and was attacked on general lines by the Jesuits for preaching heretical doctrines. From 1714 to 1716 he was commissioned by the Duke of Modena to collect material relating to the history of the duchy which he published as *Antichità estensi* (2 vols., 1717-40). This work led him to undertake the project of collecting similar materials for Italy as a whole from the fifth to the sixteenth century, which extended over 15 years and appeared as *Rerum Italicarum Scriptores* (25 vols., 1723-51), to which he added a series of historical dissertations, *Antiquitates Italicae Medii Ævi* (6 vols., 1738-42). Consult: the biography by his nephew, G. F. Muratori, *Vita del celebre Lodovico Antonio Muratori* (Venice, 1756); Troya, *Studi intorno agli annali d'Italia del Muratori* (Naples, 1877; new ed., 1901 et seq.). His letters were published by Lazzari (Venice, 1783). Consult also bibliography in Hauck-Herzog, *Realencyclopædie für protestantische Theologie*, vol. xiii (3d ed., Leipzig, 1903).

MURATORIAN FRAGMENT, or CANON OF MURATORI. A fragment of a treatise upon the Bible canon containing 85 lines and commenting upon the several books and so giving a very important list of the books accepted as canonical in Italy at the time of its composition, which probably was the latter half of the second century. In the list are the Gospel of Luke, which it calls the third (the fragment begins at this point, so doubtless Matthew and Mark had been mentioned in the part now lost), John, Acts, the Epistles of Paul to the Corinthians, Ephesians, Philippians, Colossians, Galatians, Thessalonians, Romans, Philemon, Titus, and Timothy, Revelation of John, Jude, two Epistles of John, Wisdom of Solomon; and, as doubtful, the Revelation of Peter, but omits the Epistles of James and of Peter and the Epistle to the Hebrews. The fragment was discovered in the Ambrosian Library at Milan (1740) by Lodovico Antonio Muratori (qv), from whom it receives its name. It is translated in the *Ante-Nicene Fathers*, vol. v. For the text and its translation, consult Tregelles, *Canon Muratorianus* (Oxford, 1867); B. F. Westcott, *History of the Canon* (6th ed., London, 1889); H. M. Gwatkin, *Selections from Early Christian Writers* (New York, 1893); J. C. Ayer, *A Source Book for Ancient Church History* (ib., 1913).

MURAVIEV, mō'ra-vyěf'. An ancient and distinguished Russian family, originally of Moscow, which in 1488 was presented by Czar Ivan Vasilievitch with large estates in the Province of Novgorod. The best-known members of the family are MIKHAIL NIKITICH (1757-1807). Catharine II made him the tutor of her grandchildren, Alexander and Konstantin, for whom he composed works in prose and poetry. He also occupied various important administrative posts. His works were published in three volumes (Moscow, 1810). — NIKOLAI NIKOLAEVICH.

VITCH (1768-1840) He studied at Strassburg, and thereafter served for some time in the army and navy. In 1797 he founded a private institution for officers of the general staff. During the War of 1812-14 against Napoleon he served as colonel. His school became a state institution in 1816, and he continued to superintend it until 1823, after which he devoted himself to agriculture.—**ALEXANDER NIKOLAIEVITCH** (1792-1864). He was the eldest son of the preceding, and was prominent in the Decembrist uprising, which broke out in 1825 at the accession of Nicholas I. In consideration of his father's services his life was spared and he was exiled to Siberia. Later he was permitted to return, and during the Crimean War he entered the army and became a major general.—**NIKOLAI NIKOLAIEVITCH** (c.1794-1866) The brother of the preceding. He entered the army in 1810 and took part in the campaigns of 1812-14 against the French. After the end of the war he remained in the army, and traveled extensively in Asia. He served during the Persian War and was made a major general. In 1830 the Polish Rebellion broke out, and Muraviev was called in to aid in suppressing the revolt. In 1832 he was sent to Egypt to treat with Mehemet Ali for the conclusion of peace with Turkey. He then took charge of the Russian forces dispatched to the Bosphorus to aid the Sultan against Mehemet Ali. In 1838 he fell into disgrace and retired from the army, remaining inactive until 1848. During the Crimean War he rendered valuable service to Russia in the Caucasus. The capture of Kars, in November, 1855, earned for Muraviev the title of prince and other great honors.—**MIKHAIL NIKOLAIEVITCH** (c.1796-1866) A brother of the preceding. He entered the army and participated in the campaigns against France of 1812-13. He took an active part in the uprising of the Decembrists and was imprisoned for five months. Afterward he reentered the military service and soon occupied a prominent place among the Russian statesmen of the time. He occupied many important administrative positions, and opposed vehemently the emancipation of the serfs. During the Polish Rebellion of 1863 he was sent to Vilna, and acted with such relentless rigor that in a few months the entire insurrection was suppressed. His acts of cruelty made his name infamous throughout Europe.—**MIKHAIL NIKOLAIEVITCH, COUNT** (1845-1900) A grandson of the preceding. He was born April 19, 1845, studied in Heidelberg, and in 1864 entered the service of the Ministry of Foreign Affairs. He was attached to various Russian embassies in Europe, and on the death of Prince Lohanov in 1897 he became Minister of Foreign Affairs. He advanced Russian interests in the Far East and put forth the Czar's note for The Hague Peace Conference in 1898. He died June 21, 1900.

About 1730 a member of the Muraviev family married a daughter of Apostol, the Ataman of the Cossacks, whose name was added to his own. Of this branch of the family the best known is **SERGEI MURAVIEV-APOSTOL** (1796-1826). He participated in the Decembrist uprising of 1825, proclaimed Grand Duke Konstantin as Emperor, and seized the town of Vasilkov. Troops were sent against him and he was captured, taken to St. Petersburg, and hanged July 25, 1826.

NIKOLAI NIKOLAIEVITCH, COUNT MURAVIEV-

AMURSKI (c.1809-81), belonged to another branch of this family. He entered the army while young, and served in the Caucasus, where he attained the rank of major general. In 1848 he was appointed Governor-General of eastern Siberia, and gained for Russia the entire territory of the Amur, and concluded the Treaty of Aigun, May 28, 1858, by which this country was definitely ceded by China. His services were rewarded by the title of Count, and he received the name Amurski. In the summer of 1859 he went with twelve ships to Yeddo, and concluded a favorable treaty with Japan. He resigned his governorship in 1861, and was made a member of the Imperial Council.—**NIKOLAI VALERIANOVITCH** (1850-1908), a nephew of Muraviev-Amurski, received his education in a military academy, the Third Classical College of Moscow, and the law school of Moscow University. After taking his degree in 1870, he was appointed assistant district attorney for the city of Moscow. By rapid advancement he became Minister of Justice in 1894. While serving as Imperial Secretary, he had taken an active part in revising and codifying the Russian law, and in his new office he carried out a reform of the courts and brought the prisons, formerly in the police jurisdiction, under the control of his department. In 1903 he was chairman of The Hague Tribunal which passed on the Venezuela claims matter, and from 1905 to his death he was the Russian Ambassador to Italy. Nikolai Valerianovitch also became known as a philanthropist and as the author of many important articles on legal subjects.

MURCAY, MARIE MARGUERITE LE VALOIS DE VILLETTE DE, See CAYLUS, M. M.

MURCHISON, mŭr'ch-i-sŏn, CHARLES (1830-79) A British physician, born in the island of Jamaica. He was educated at the universities of Aberdeen, Edinburgh, Dublin, and Paris. In 1853 he entered the East India Company's military service, but soon after reaching India was appointed professor of chemistry at the Calcutta Medical College. In 1855 he published two valuable papers on *The Climate and Diseases of Burmah*. The same year he returned to Europe, and settled in London, where he was connected with a number of the leading hospitals. He was not only an authority on tropical fevers, but also an able geologist. He published over 300 articles. Among his works are *Clinical Lectures on Diseases of the Liver, Jaundice, and Abdominal Dropsy* (1868, 3d ed, 1885; Fr. and Ger trans); *Treatise on the Continued Fevers of Great Britain* (1862, 3d ed, 1884, Fr. and Ger trans), a very important work, although he opposed the bacterial theory of infection, *Functional Derangements of the Liver* (1874, 3d ed, 1885).

MURCHISON, SIR RODERICK IMPEY (1792-1871) A British geologist, born in Tarradale, Ross. After studying at the military college of Marlow, he entered the army and served as an officer in the Peninsular War under Wellington. Through the advice of Sir Humphry Davy he was induced to take up the study of science, and in 1825 became a fellow of the Geological Society of London, before which he read a paper entitled "Geological Sketch of the Northwestern Extremity of Sussex and the Adjoining Parts of Hants and Surrey." Returning from a geological tour through France, which he made in the company of Sir Charles Lyell, he undertook a systematic exploration and study of the lower

fossiliferous strata of England and Wales. This work engaged his attention for many years and resulted in a reclassification of the Paleozoic rocks, with the introduction of a new system to which, in 1835, he gave the name Silurian. In coöperation with Sedgwick, with whom later he was to become involved in a bitter controversy over the so-called Cambrian question, he established the existence of a group of strata between the Silurian and the Carboniferous which was named the Devonian system. He was soon after employed by Emperor Nicholas in a geological survey of Russia, being associated with De Verneuil and Keyserling, during the years 1840-44 he explored a large part of southern Russia and introduced another new system—the Permian—into the geological time scale. From his knowledge of the geological structure of the Ural Mountains and the Australian systems, he was led to believe that gold occurred in the latter, and as early as 1844 predicted its discovery. Murchison was elected president of the British Association for the Advancement of Science in 1846, president of the Royal Geographical Society in 1844, 1845, and 1857, and in 1855, upon the death of Sir H. T. De la Beche, became director of the British Geological Survey. He was knighted in 1846, made Knight Commander of the Bath in 1853, and a Baronet in 1863. From the Emperor of Russia he received the grand cross of St. Anna and that of St. Stanislas. The greater portion of his contributions to science were published in the society journals. Among his principal works are *Geology of Cheltenham* (1834); *The Silurian System* (1839); *On the Geological Structure of the Northern and Central Regions of Russia in Europe* (1841); and *Geology of Russia in Europe and the Ural Mountains* (1845). Consult Geikie, *Life of Sir Roderick I. Murchison* (London, 1875).

MUR'CHISO'NIA* (Neo-Lat., named in honor of Sir R. I. Murchison). An extinct gastropod of the family Pleurotomaridae, found in rocks of Ordovician to Triassic age, and especially common in the Devonian and Carboniferous formations. The shell has a more or less pointed spire consisting of numerous coils or whorls. The aperture has in its outer lip a slit like that of *Pleurotomaria*, and a corresponding slit band that forms a more or less pronounced ridge on the outside of the whorls all the way from the aperture to the apex of the shell. The earlier species as a rule have smooth-surfaced shells, the later species are more frequently ornamented by nodes and transverse ridges. A subgenus, *Hormotoma*, with rounded whorls, is represented by *Murchisonia gracilis*, a very common species in the Trenton limestone of the United States and Canada. *Loroplocus*, another very peculiar genus, with the coils of the spire unrolled and somewhat carinate in section, lived in the cavities of the corals that made up the Guelph beds of Canada and western New York. See PLEUROTOMARIA.

MURCIA, mūr'thē-a. A former division and an old Moorish Kingdom of Spain, situated in the southeastern part of the country and bounded on the north by New Castile, on the east by the former Kingdom of Valencia, on the south by the Mediterranean Sea, and on the west by the former kingdoms of Granada and Jaén and by New Castile (Map Spain, E 4). The division comprised the modern Province of

Murcia, the greater part of Albacete, and small portions of Jaén and Alicante, with a total area of about 10,000 square miles.

The surface of Murcia partakes of the general character of the whole peninsula—the interior plateau, the rapid and mountainous slope towards the sea, and the low coastal region. The last is a sandy semiarid belt from 10 to 20 miles wide, and broken by several coast lagoons, of which the Mar Menor is the largest. The mountainous belt occupies the greater part of the division, and consists of an irregular system of ranges whose nucleus and highest point is the Sierra de Espuña, with an altitude of 5193 feet. North of the mountains the interior plateau forms a part of La Mancha, a deforested and almost arid plain. The principal water system is the Segura River with its tributaries, which are used only for irrigation and are subject to great variations in volume, being at some seasons almost dry and at other times subject to disastrous inundations. The climate is subtropical near the coast and temperate on the slopes and plateaus. The winters are mild, the sky nearly always clear, and the climate is pleasant and healthful, but the rainfall is insufficient for the needs of agriculture. The whole region has been almost entirely deforested, and agriculture can be carried on only in the valleys by means of irrigation. Many of the valleys, however, are well cultivated, especially the Huerta, or Garden, of Murcia, which is one of the most beautiful places in Spain. The chief agricultural products are wheat, barley, and flax. Oranges, lemons, olives, grapes, and hemp are grown in the south. Mining is an important industry, producing iron, lead, zinc, copper, and sulphur. Other industries are silk manufactures and the plating of articles of esparto grass. The population in 1900 was 577,987 and, in 1910, 615,105. The chief city is Murcia (q.v.).

Murcia was the centre of the Carthaginian colonies in Spain. It was conquered by the Saracens early in the eighth century and by them called Todmir. It formed a province of the Caliphate of Córdoba, after whose dissolution, in the early part of the eleventh century, it became an independent Moorish kingdom. About the middle of the thirteenth century it was conquered by Castile.

MURCIA. The capital of the Province of Murcia in southeast Spain. It lies on both banks of the Segura River, in the beautiful valley known as the Huerta, or Garden, of Murcia (Map Spain, E 4). This valley rivals in the luxuriance of its vegetation the famous Vega of Granada. It was carefully irrigated by the Moors, and is covered with vineyards and groves of mulberry, olive, and fig trees. The city itself has broad streets and a clean and generally neat appearance. Several promenades and pleasure grounds have been laid out along the embankments of the river, and the Paseo de Florida Blanca is a wide avenue with fine rows of plane trees. Though the city still retains some of its old Moorish atmosphere and a few typically narrow streets, with balconied houses, it has preserved but few objects of interest. The only building which attracts considerable notice is the cathedral, a Gothic-Romanesque structure begun in the fourteenth century. Its façade in the baroque style dates from the eighteenth century, and its tower, the most interesting feature, was begun in 1522 and com-

pleted in 1766. Other prominent buildings are the imposing bishop's palace, the city hall, with a monumental façade, the Colegio de San Fulgencio, two theatres, a bull ring, the Moorish Alhondiga or granary, and the large and well-built silk factories. There are a provincial museum, two normal schools, and a secondary school. The industries are largely derived from the surrounding huerta, the chief being the silk industry, which, with grain and fruit raising, furnishes the principal articles of trade. There are also manufactures of woolen goods, gunpowder, soap, leather, hats, and musical instruments. The city has had a long and interesting history under Romans, Moors, and Spaniards. Pop., 1900, 111,693; 1910, 125,057.

MURDER (AS. *morþor*, *morþur*, from *morþ*, OHG. *mord*, Ger. *Mord*, death, connected with Welsh *maru*, Lith *smertis*, Lat *mors*, death, Gk. *śpōrōs*, *brōtos*, mortal, Skt. *mar*, to die). The unlawful killing of a human being with malice aforethought. The term appears to have been limited in early English law to a homicide committed in secret or accompanied by concealment of the body. During the Norman period, this *morth* (or secret) slaying of Saxon times became the *murdrum*—the homicide of the very worst kind, and was distinguished by Glanville from a mere *homicidium*, or open killing. For a considerable time *murdrum* signified the fine imposed by the crown on any hundred in which a man was slain, as well as the killing itself. This fine—originally 46 marks, of which 40 went to the King and 6 to the kinsfolk of the deceased—could be avoided by the production of the slayer, or by proof that the slain man was an Englishman and not of Franco-Norman race. Furnishing such proof was known as Englishry. From the time that Englishry was abolished in 1348 murder bears the single meaning of unlawful homicide of the worst species, which subjects the slayer to capital punishment.

The next step in the history of murder as a term of English law "consists in the adoption of 'malice aforethought' as the characteristic specific distinction of murder as distinguished from other kinds of homicide." This came about from the forms of the special findings of the jury in prosecutions for homicide. In order to entitle the slayer to a pardon under the Statute of Gloucester (6 Edw. I, c 9, 1278 A.D.) it was necessary for the jury to find that he acted "in self-defense and not by felony or of malice aforethought." During the next two and a half centuries the modern distinction between willful murder and manslaughter (q.v.) was developed, as appears by a statute of 1531 (23 Hen VIII, c 1, § 3), which takes away the benefit of clergy (q.v.) in cases of "willful murder of malice prepense."

The first element in the crime of murder is unlawfulness, as distinguished from the killing which is justifiable or excusable homicide. (See HOMICIDE.) Not only must the killing be unlawful, but the person killed must be a "reasonable creature in being." Accordingly, the killing of an unborn child is not murder at common law, but the crime of abortion (q.v.). The other essential element in murder is the malice aforethought with which the killing is done. This requires, first of all, sanity and discretion on the part of the slayer. An idiot, a lunatic, or an infant below the age of discretion cannot commit murder. While malice aforethought is essential to the crime of murder, the law does

not require the lapse of any prescribed time between the formation of the intention to kill and the killing. It is sufficient that the murderous intention precedes and accompanies the act of homicide. If the will accompanies the act a moment antecedent to the act itself which causes death, this makes the offense murder as certainly as if a day intervened between the willing and the doing. The malice in case of murder must be actual, or, as it is sometimes said, express, in contradistinction to implied malice. This does not mean, however, that the slayer must actually have intended to kill his victim, nor that he bore towards him a settled and malignant ill will. Hence if one shoots at A and misses him, but kills B, this is murder, because of the previous felonious intent, which the law transfers from one to the other. So if one lays poison for A, and B, against whom the poisoner had no felonious intent, takes it and is killed, this is murder. In short, the idea of malice aforethought is not spite or malevolence to the deceased in particular, but evil design in general; not so much premeditated personal hatred or revenge towards the person killed as a deliberately unlawful purpose which, if persevered in, must produce mischief. At the common law the procuring of a person to commit suicide (q.v.) is murder if the suicide is accomplished. So it is said in the books that if two persons agree to commit suicide and attempt to carry their design into execution, but only one dies, the survivor is guilty of murder if he were present at the commission of the suicide, otherwise he is an accessory before the fact.

The common law knew nothing of degrees of murder. If the homicide was committed unlawfully and with malice aforethought, the slayer was a murderer and, upon conviction, liable to capital punishment. This penalty has been thought too severe for some kinds of murder, and a number of the United States have divided the offense into two degrees, continuing capital punishment for the first degree and punishing the second degree with imprisonment. While these statutes differ in detail, they agree in limiting the definition of murder in the first degree to those cases where the killing was done in a willful, deliberate, premeditated, or particularly cruel manner or while engaged in the commission of some heinous felony, such as arson, and in some States rape and burglary. Consult J. F. Stephen, *History of the Criminal Law of England* (3 vols., London, 1883); J. P. Bishop, *New Commentaries on the Criminal Law* (Chicago, 1892); F. Wharton, *Criminal Law* (Philadelphia, 1896); Clark and Marshall, *Law of Crimes* (St Paul, 1900); and authorities referred to under CRIMINAL LAW.

MURDERER'S BIBLE. See BIBLE, CURIOUS EDITIONS OF.

MURDERS IN THE RUE MORGUE, THE. A tale by Edgar A. Poe which appeared in *Graham's Magazine* in 1841 and became a model for later detective stories.

MURDOCH, JAMES EDWARD (1811-93). An American actor, born in Philadelphia. His first appearance on the stage was in his native city in 1829. In 1833 he acted with Fanny Kemble during her tour in America and in 1856 played with some success at the Haymarket Theatre in London. During the Civil War in America he devoted himself to caring for sick and wounded soldiers and gave popular readings for the benefit of the United States Sanitary Commis-

sion. Subsequently he was professor of elocution in the Cincinnati College of Music. Joseph Jefferson characterized his acting as "not only extremely versatile, but entirely original." His greatest successes were in comedy and lighter tragedy. With William Russell he published *Orthophony, or Culture of the Voice* (1845) and *The Stage* (1880).

MURDOCK, JAMES (1776-1856). An American scholar, born at Westbrook, Conn., and educated at Yale, class of 1797. He taught school in New Haven and at Oneida Academy, now Hamilton College, studied for the ministry, was licensed in 1801, preached for 13 years in the Congregational church of Princeton, Mass., and was professor of ancient languages in the University of Vermont from 1815 until 1819, when he went to Andover Theological Seminary. There he taught sacred rhetoric and Church history until 1829, and then he removed to New Haven, where he devoted his last years to private study. He published versions of Munscher's *Elements of Dogmatic History* (1830), of Mosheim's *Institutes of Ecclesiastical History* (1832), and of Mosheim's *Affairs of the Christians before the Time of Constantine the Great* (1852), a *Literal Translation of the Whole New Testament from the Ancient Syriac Version* (1851), *Sketches of Modern Philosophy* (1842).

MURDOCK, JOSEPH BAILLARD (1851-). An American naval officer, born at Hartford, Conn. In 1870 he graduated from the United States Naval Academy, then served on the North and South Atlantic stations and on the Coast Survey, was instructor in physics at the Naval Academy in 1880-83, and was executive officer of the *Panther* during the Spanish-American War. Murdock became commander in 1901, captain in 1906, and rear admiral in 1909. He commanded the *Rhode Island* in the cruise around the world in 1907-09, was commandant of the New York Navy Yard in 1909-10, and served as commander of the second division of the Atlantic fleet in 1910-11 and as commander in chief of the Asiatic fleet in 1911-12. In 1913 he was retired. He published *Notes on Electricity and Magnetism* (1884).

MURDOCK, VICTOR (1871-). An American legislator. He was born at Burlingame, Kans., and was educated in the public schools and at Lewis Academy, Wichita. After having gained experience in newspaper work in Chicago from 1891 to 1893, he was from 1894 to 1903 managing editor of the *Wichita Daily Eagle*. In 1895-97 he was also clerk of the Kansas Appellate Court. Elected as a Republican to the Fifty-eighth Congress in 1903 to fill the unexpired term of C. I. Long, he retained his seat through successive reelections until March, 1915. Murdock was one of the leading insurgents in his party during the Taft administration, taking an active part in the overthrow of Speaker Cannon in 1910 and in 1912 breaking away to identify himself prominently with the new Progressive party. He was nominated for Speaker of the House in 1913. The next year he was the choice of Kansas Progressives for United States Senator, but was defeated by Charles Curtis, Republican. In a referendum to the national committee of the Progressive party (1915) Murdock was elected to succeed Senator Joseph M. Dixon as chairman of the committee.

MURDOCK, WILLIAM (1754-1839). An English engineer, who was the first to employ coal gas as an illuminant. He was born at Bellow

Mill, Ayrshire. Working as the assistant and coadjutor of James Watt, he became superintendent of construction and erecting engineer for that famous inventor. In 1784 he made a working model of a locomotive engine which had a flue boiler and single cylinder and was capable of a speed of from 6 to 8 miles an hour. He did not develop the idea, however, on a large scale, and about 1792 he turned his attention from engines to lighting by coal gas. (See GAS, ILLUMINATING.) The actual perfection of this invention was attained probably two or three years afterward, and in 1802 gas was used in the illumination of Soho, London, after the news of the Peace of Amiens. Murdock made several improvements on Watt's steam engine, especially in the valve gear, and invented an independent or rotary engine and various apparatuses by which compressed air might be used, including its use for operating machinery, and was the first to use it for sending packages through tubes.

MURE, mūr, SIR WILLIAM (1594-1657). A Scottish poet, born probably in Ayrshire, where the Rowallan estate, which he inherited, was situated. In 1643 he was a member of Parliament in Edinburgh, and he was wounded the next year at Marston Moor. His principal effort is his clever but somewhat heavy *True Crucifix for True Catholics*, which appeared in 1629. His other writings are a poetical translation (1628) of *Hecatombe Christiana*, a Latin poem by Boyd of Trochrig, many miscellaneous poems, and a paraphrase of the Psalms (1639). His *Historie and Descent of the House of Rowallan*, edited by W. Mure, 1825, is quaint and valuable.

MURE, WILLIAM (1799-1860). A Scottish classical scholar, born at Caldwell, Ayrshire. After studying at Westminster School and at Edinburgh, he spent several years at the University of Bonn. His chief work, *A Critical History of the Language and Literature of Ancient Greece* (5 vols., 1850-57), was left unfinished, but the several portions of it on the epic and lyric poets and the historians may be regarded as separate works. His attempt in the first two volumes to prove the essential unity of the *Iliad* and the *Odyssey* and the identity of their authorship won him a wide reputation among European scholars. His treatment of Xenophon (q.v.), also, has been much admired. In addition to numerous contributions to the *Edinburgh Review*, his publications include: *Brief Remarks on the Chronology of the Egyptian Dynasties* (1829); *A Dissertation on the Calendar and Zodiac of Ancient Egypt* (1832); and his *Journal of a Tour in Greece and the Ionian Islands* (1842). He sat in Parliament for Renfrewshire in 1846-55 and was lord rector of the University of Glasgow in 1847-48.

MUREAU, BARON MILET DE. See MILET DE MUREAU, L. M. A. D.

MURET, mūr'rā', or MURETUS, MARC ANTOINE (1526-85). A French humanist. He was born at Muret, near Limoges, became a proficient scholar in Greek and Latin, and when but 18 lectured in the College of Auch. Between 1544 and 1559 he taught Latin at Ville-neuve, Bordeaux, and Paris. At the invitation of Cardinal Ippolito d'Este, he took up his residence in Rome, where he won fame by his lectures (1559). He took orders in 1576 and in 1584 retired from his professoriate. He wrote *Orationes* and *Epistolæ*, and his *Variarum Lec-*

tionum Libri XIX is still valuable. He edited also several Latin authors. His reputation rests chiefly, however, upon the classic Latinity of his style. The best edition of his collected works is that of Frotscher and Koch (Leipzig, 1834-41). Consult J. E. Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).

MUREX (Lat., purple fish). A genus of tropical shells, large, heavy, and variously armed with stout spines, processes, or knobs. These are to protect and strengthen the shells, for the animals live on exposed coasts. One species (*Murex pomum*) is found along the American coast from Cape Hatteras to Texas. It is from 2 to 3 inches in length, but not so conspicuously spiny as some more tropical forms. Allied to *Murex* is the oyster drill (*Urosalpinx cinerea*), which bores into oyster shells by means of its lingual ribbon. (See DRILL.) *Murex forispina* of New Caledonia is furnished with a powerful tooth at the lower part of its outer lip. Its favorite food is *Arca pilosa*, a species of bivalve allied to the Noah's ark (see ARK SHELL), which lives half buried in coral refuse. Many of the tropical species are gayly colored, and some yield, when the animal is crushed, a rich violet-purple liquid which will act as a permanent stain and which furnished to the ancients their royal-purple dyes. Other shells yield this or a similar color. See PURPLE SHELL; also Colored Plate of GASTROPODS.

MUREXIDE (from Lat. *murex*, purple fish), AMMONIUM HYDROGEN PURPURATE, or ROMAN PURPLE, $C_8H_4N_2O_6 \cdot NH_3 \cdot H_2O$. A beautiful coloring matter similar to the Tyrian purple of the ancients, which was made from a species of *Murex*—hence its name. Scheele in 1776 obtained a red precipitate on evaporating to dryness a solution of uric acid in nitric acid. This reaction still forms the basis of the well-known murexide test for uric acid and related compounds. As uric acid exists in abundance in guano, that material has been found one of the best sources from which to obtain murexide. According to Prout, 1818, and Liebig and Wöhler, 1838, murexide is best obtained by oxidizing uric acid with nitric acid and after evaporating for some time at a temperature a little short of boiling, while still hot, adding a slight excess of ammonia. Two compounds are formed by this process, alloxan and alloxantin, and their reaction on each other results in the formation of the beautiful minute green metallic-lustred crystals of murexide, which, in combination with some of the compounds of lead and mercury, yield most brilliant red and purple dyes. The use of murexide was becoming extensive until the discovery of the aniline colors, the greater brilliancy of which has checked its employment. The acid combined in murexide, viz., purpuric acid, $C_8H_4N_2O_6H$, is not known in the free state. See URIC ACID.

MURFREE, mŭ'frĕ, MARY NOAILLES (1850-). An American novelist, born in Murfreesboro, Tenn., best known by the pseudonym of Charles Egbert Craddock. She early devoted herself to reading and literary work, partly because of a lameness which barred her, even as a child, from physical activity. Choosing as her field the mountain regions of Tennessee and the people who dwell there, Miss Murfree treated both with a freshness and fidelity born of a keen perception of, and a complete familiarity

with, what was typical and appealing in them. Her work assures her an honored place among the Southern writers of her generation. Her writings include: *In the Tennessee Mountains* (1884), *The Prophet of the Great Smoky Mountains* (1885), *In the "Stranger People's" Country* (1891), *The Phantoms of the Foot-Bridge* (1895), *The Mystery of White-Face Mountain, and Other Stories* (1895), *The Young Mountaineers* (1897), *The Bushwhackers, and Other Stories* (1899), *A Spectre of Power* (1903), *The Frontiersman* (1905), *Storm Centre* (1905), *The Amulet* (1906), *The Windfall* (1907), *The Fair Mississippian* (1908), *The Raid of the Guerilla* (1912), *The Story of Duclaw* (1914).

MURFREESBORO. A city and the county seat of Pike Co., Ark., 45 miles southwest of Hot Springs, on the Little Missouri River and on the Memphis, Dallas, and Gulf Railroad (Map: Arkansas, B 3). It is in a rich farming and fruit-growing region, noted particularly for its fine peaches, and there are also saw mills. Many mineral deposits are found. The largest diamond mine in active operation in the United States is located 2 miles south of Murfreesboro. Pop., 1910, 516.

MURFREESBORO. A city and the county seat of Rutherford Co., Tenn., 33 miles southeast of Nashville, on the Nashville, Chattanooga, and St. Louis Railroad (Map: Tennessee, D 3). It is the seat of Soule Female College (Methodist Episcopal, South), opened in 1852, of the Mooney School, established in 1901, the Middle Tennessee State Normal School, and the Tennessee College for Young Ladies (Baptist), established in 1906. The city has manufactures of flour, lumber, cedar ware, leather, carriages, cotton gins, machine-shop products, etc., and carries on a trade in cotton, mules, and cattle. Near the city is the Stone River battlefield (see STONE RIVER, BATTLE OF), the site of a national cemetery with 6150 graves, 2333 of unknown dead. Murfreesboro was incorporated in 1817. From 1819 to 1825 it was the State capital. The commission form of government went into effect in January, 1915. Pop., 1900, 3999, 1910, 4679.

MURFREESBORO, BATTLE OF. See STONE RIVER, BATTLE OF.

MURGER, mu'zhă', HENRI (1822-61). A French novelist and poet, born in Paris, March 24, 1822, who made attractive to his readers the irresponsible life of artists and students in Paris. Among his works are: *Scènes de la vie de Bohème* (1848); *Scènes de la vie de jeunesse* (1851); *Les buccurs d'eau* (1854), *Madame Olympe* (1859); other prose tales, and the poems *Les nuits d'hiver* (1861). In 1849, in collaboration with Théodore Barrière, the novel *Scènes de la vie de Bohème* was dramatized and played at the *Théâtre des Variétés* under the name of *La vie de Bohème*. The opera *La Bohème*, music by Puccini, 1898, is based upon that drama. To Murger, if to any one writer, literature perhaps owes the word 'Bohemia', signifying, not a geographical spot, but a moral condition. Murger left some classic tales and songs of dissolute thriftlessness and literary impecuniosity that have deluded a generation into looking back with dreamy regret on the sordid follies of their student days. The first Romantic generation, that of Gautier, had real enthusiasm, the ardor and fervor of renaissance, for which Murger's whimsical hysteria of merri-

ment and his vicious sentimentality are but a poor substitute. Murger was trained for the law, became for a time secretary of Count Leo Tolstoy, but like that earlier Bohemian, Villon, he chose dissipation rather than decency. He died in a charity hospital in Paris, Jan. 28, 1861. A monument was recently erected to his memory, not without protest. Several of Murger's songs are translated by Andrew Lang in *Ballads and Lyrics of Old France* (London, 1872). Estimates of Murger by fellow Bohemians may be found in *Les nuits d'hiver* (Paris, 1862).

MURGHAB, mūr-gāb'. A river of Central Asia, rising in the Paropamisus Mountains, on the north boundary of Afghanistan (Map: Afghanistan, K 4). It flows northwestward into Russian Turkestan, in the Merv Oasis it is flanked by a network of canals for irrigation, and after a course of 366 miles is lost in the sands and marshes of the desert about 150 miles below Merv.

MURIATIC ACID. See HYDROCHLORIC ACID.

MURIDÆ (Neo-Lat. nom. pl., from Lat. *mus*, Gk. *mūs*, *mūs*, mouse). The family of rats and mice, typified by the house mouse (*Mus musculus*). It embraces in its 76 genera (Thomas) more than a third of all the rodents, is world-wide in its distribution, and includes many species of great importance to man, as pests or otherwise. The family has been monographed by Oldfield Thomas in the *Proceedings of the Zoological Society of London* (London, 1881). Consult also authorities cited under RODENTIA, and see GERBIL, HAMSTER, MOUSE, MUSKRAT, RAT; VOLE, WATER RAT, and similar titles.

MURILLO, mūr-rē'l'yō, BARTOLOMÉ ESTEBAN (1617-82). A Spanish religious and genre painter, one of the chief masters of the school of Seville. He was born in Seville, the last week of December, 1617. Very little is known of his early life except that he was left an orphan at 10, was adopted by his uncle Juan Lagares, and when quite young was apprenticed to Juan del Castillo, from whom he learned the rudiments of painting, but upon the departure of the latter to Cadiz in 1640 Murillo was left without means, and for the succeeding two years he supported himself by painting cheap religious compositions for unimportant convents and churches and rough, brilliantly colored pictures for the *Feria*, a weekly. His close contact with the beggars and print sellers gave him unusual opportunity for studying their characteristics, and his reproductions of them upon canvas exhibit a sympathy and somewhat idealized presentation alike notable. These earlier works may be cited as representing the artist's first period, during which he attained results intensely individualized and at the same time expressive of the type.

The example of Moya, a fellow pupil in the studio of Castillo, made Murillo discontented with his position at Seville, and he resolved to visit Rome, but, not having the means for the longer journey, he set out on foot for Madrid. Velazquez gave him shelter in his own house and access to the royal galleries, where, with untiring zeal, he copied Ribera, Titian, Rubens, Van Dyck, Velazquez, and other masters. This course of practice, extending from 1642 to 1645, gave him a much freer style and greater control of color.

He then returned to Seville, and in 1648 married a wealthy and noble lady of that city, and his house became the resort for distinguished people. In 1650, upon the death of Pacheco, he became the acknowledged head of the Seville school and the president of the academy founded in 1660. During these years he was continually improving in style, becoming more idealistic in conception and individual in technique. His ensuing works are usually classed in accordance with his three styles: an "estilo frío," or cold style (1648-52), fine examples of which are the series of 11 pictures for the small Franciscan convent near Casa del Ayuntamiento, an "estilo cálido," or warm style (1652-56), characterized by a mastery of color contrasts; an "estilo vaporoso," so called from a certain vaporous or misty effect produced. This style, according to Calvert, begins in 1656 with four pictures illustrating the "Founding of Santa Maria Maggiore," painted for Santa Maria Blanca, Seville. A favorite subject of this era was the Immaculate Conception, which he painted no fewer than 15 times, one of the most famous examples being in the Louvre, Paris. It was taken from Spain by Marshal Soult, and bought by the French government at the Soult sale, in 1852, for 586,000 francs.

Murillo is very popular with the general public, but certain artists, while acknowledging his facility and charm, find his work lacking in technique, force, and originality. His work is highly subjective—so much so that the attention of the beholder is often attracted to the personality of the artist rather than to the subject represented. Murillo's chief importance consists in the wonderful manner in which he employed the medium of Spanish realistic forms to express ideal religious conceptions.

Much of the work of the artist was taken from Spain during the Peninsular campaign, a fact that accounts for the number of fine examples to be found in the galleries of Europe, the collections of London and Paris being especially rich.

The cathedral of Seville is rich in his works, among which are "Sts. Leander and Isidore," the "Vision of St. Anthony" (1656), and "La Purísima" (1668). In the museum are 17 of the 26 pictures painted for the Capuchin monastery at Seville, among which are several "Immaculate Conceptions" and the beautiful "Charity of Thomas of Villanova," the favorite picture of Murillo. Mention should also be made of eight large pictures painted for the church of St. George (1661-74), of which three—"Moses Striking the Rock," the "Miracle of the Loaves and Fishes," and "San Juan de Dios Attending the Sick"—remain in their original places. In the Prado (Madrid) are the beautiful "Children of the Shell" (the infants Jesus and John), the "Adoration of the Shepherds," the "Education of the Virgin," "St. Elizabeth of Hungary" and the "Immaculate Conception with the Crescent Moon." Other famous works are "The Birth of Mary" (1655), "The Holy Family, with St. Elizabeth" (1670), and the "Angels' Kitchen," in the Louvre, "The Vision of St. Anthony of Padua," in the Berlin Museum. The Hispanic Society of America possesses two small canvases, the Metropolitan Museum a "St. John on Patmos." Excellent examples of Murillo's Madonnas are in the galleries of Dresden, Madrid, Seville, Florence

(Pitti Palace), and Rome (Corsini Palace). Of his admirable series of genre subjects the best-known examples are in the national collections of Munich, Paris (Louvre), London, and St. Petersburg, and at Dulwich, London "Gallegas at the Window" is in the Widener collection, Philadelphia. Murillo's last work was the altar-piece of St. Catharine, painted at Cadiz for the church of the Capuchins. The picture was never completed, for Murillo fell and had to return to Seville, where he died shortly afterward, April 3, 1682. He was buried, by his own request, in the church of Santa Cruz, Seville, before Pedro de Campagna's picture of the "Deposition from the Cross."

Bibliography. The best biography of Murillo is by A. F. Calvert (New York, 1907), the most recent is by Mayer (Stuttgart, 1913), with many illustrations, others are by F. M. Tubins (Seville, 1864), Stomer (Berlin, 1879); L. Alfonso (Barcelona, 1886); Carl Justi (Leipzig, 1892), a scholarly treatise; Hermann Knackfuss, in *Kunstler-Monographien*, vol. x (Bielefeld, 1897); G. C. Williamson (New York, 1903); Lafond (Paris, 1908), S. L. Bensusan (Boston, 1910); also, Sir William Stirling-Maxwell, *Annals of the Artists of Spain* (London, 1848); Curtis, *Velasquez and Murillo* (ib., 1883), Paul Lefort, *Murillo et ses élèves* (Paris, 1892); *Masters in Art*, vol. i (Boston, 1900), with an exhaustive bibliography.

MURIS, my'rēs, JOHN DE. An English musical theorist of the fourteenth century. Of his life nothing is known beyond the fact that he was master of mathematics at Oxford. His *Speculum Musicæ*, written between 1340 and 1350, gives a very detailed and scholarly account of the music of that time, and is by far the most important treatise on music written during the Middle Ages. It is divided into seven books, bearing the following titles: 1. "General Introduction"; 2. "Intervals"; 3. "Musical Proportions"; 4. "Consonance and Dissonance"; 5. "The Musical System of the Ancients according to Boëtius"; 6. "Ecclesiastical Modes and Solmisation"; 7. "Mensurable Music—Discantus." Before 1884 musical scholars were greatly puzzled by the open contradictions found in several treatises bearing the name of Muris, until Robert Hirschfeld discovered evidence of the existence of two contemporary theorists of the same name. Consult: Robert Hirschfeld, *Johannes de Muris* (Vienna, 1884); H. Riemann, *Geschichte der Musiktheorie* (Leipzig, 1898); J. Wolf, *Geschichte der Mensuralnotation* (ib., 1904).

MURIS, JULIANUS DE. A French musical theorist of the fourteenth century. In 1321 he was teaching at the Sorbonne in Paris, and in 1350 he was elected rector. Unlike his English namesake, he held very advanced views, strongly advocating the *ars nova* (counterpoint). His principal works are *Musica Practica*, *Musica Speculativa*, *De Discantu et Consonantibus*, *Ars Contrapuncti*, *Libellus Practicæ Cantus Mensurabilis*. See MURIS, JOHN DE.

MURISON, ALEXANDER FALCONER (1847-). An English jurist and historian, born in Aberdeenshire and educated at the University of Aberdeen. He became a barrister at the Middle Temple in 1881. He was appointed professor of Roman law in 1883 and of jurisprudence in 1901, and dean of the faculty of law in 1912, at University College, London. He

was editor of the *Educational Times* (1902-12), and wrote: *The External History of Roman Law* (1885) and, in the "Famous Scots Series," *Sir William Wallace* (1898) and *King Robert the Bruce* (1899).

MUR/LIN, LEMUEL HERBERT (1861-). An American Methodist Episcopal clergyman and educator, born in Mercer Co., Ohio. He graduated from De Pauw University (1891), from the De Pauw School of Theology (1892), and from Garrett Biblical Institute (1899), and studied also at the University of Pennsylvania, at Clark University, and in Europe. As early as 1886 he had entered the ministry, occupying several pastorates between this time and 1894 and teaching at Fort Wayne (Ind.) College and Cornell College (Iowa). From 1894 to 1911 he was president of Baker University (Kansas), and thereafter president of Boston University. While on leave of absence (1909-10) he was acting pastor of the American Church in Berlin. Murlin served as president of the Kansas Association of College Presidents, and was a leader in all State educational movements. He was a member of the General Conferences of 1900 and 1904 and of the Ecumenical Methodist Conferences of 1901 and 1911.

MURMELIUS, JOHANNES (c.1480-1517). A Dutch humanist, born in Roermond, Gelderland, and educated at Deventer, at Cologne, and at Munster. He introduced the study of Greek into Holland almost single-handed and published many excellent schoolbooks. His *Scoparius in Barbarici Propugnatores et Osoros Humanitatis* (1514) and his defense of Reuchlin are important documents. Consult the biography by Reichling (Freiburg, 1880) and the selections from his poems, edited by Reichling (ib., 1881).

MURNER, myr'nēr, THOMAS (1475-1537). A German priest and satirist, famous mostly for attacking Luther and the Reformation. Murner taught and preached in Freiburg, Paris, Cracow, and Strassburg. After voyages to Italy and England he settled in Strassburg, whence in 1525 he was frightened away by the Reformation. Murner was highly enough prized for his religious poems to be made laureate by Maximilian I in 1505. In 1506 he took his doctorate in theology; in 1514 he became guardian of the Franciscan cloister at Strassburg. In 1519 he became a doctor of jurisprudence at Basel. In his *Gauchmatt*, *Schelmensunft*, and *Varrenbeschwörung* Murner shows some realistic humor. He translated the *Æneid* in 1515. His *Die deutschen Dichtungen von Ulrich von Hutten* was published in Kurschner's *Deutsche National-Litteratur*, vol. xvii (Stuttgart, 1890). Consult: Kawerau, *Murner und die Kirche des Mittelalters* (Halle, 1890); id., *Murner und die deutsche Reformation* (ib., 1891); W. Ries, *Quellenstudien zu Murners satirisch-didaktischen Dichtungen* (Berlin, 1890); H. Schatz's dissertation, *Stimmungen und Effekte in Murners Dichtungen* (Kiel, 1909).

MUROM, moo'rōm. One of the oldest towns of Russia, situated in the Government of Vladimir, on the left bank of the Oka, 84 miles southeast of Vladimir (Map: Russia, F 3). It has an old cathedral, two monasteries, and a convent. It manufactures tallow and soap and has trade in grain. Murom is believed to have existed before the time of Rurik. Pop., 1897, 12,589; 1911, 18,616.

MURILLO

"THE IMMACULATE CONCEPTION," FROM THE PAINTING IN THE LOUVRE, PARIS

MUROMTSEV, мѹрѹм-тсѣф', SERGEI ANDREYEVITCH (1850-1910). A Russian jurist and political leader, born in St Petersburg. He studied at Moscow and Göttingen, and became professor of Roman law and jurisprudence at the University of Moscow, of which he was made prorector in 1880. In 1879 he became editor of the *Juridical Herald*. Because of his liberal opinions he was forced out of the university in 1884. In 1892 the *Juridical Herald* was suppressed and in 1899 the Moscow Juridical Society, of which he was president, was forbidden to hold any further meeting. He was elected by the Constitutional Democratic party as senior deputy from Moscow to the first Russian Duma, of which body he was unanimously chosen president. Muromtsev was successful in keeping its discussions confined to fundamental questions. On the dissolution of the first Duma he was one of the 200 deputies who framed the famous Viborg appeal to the people to refuse to pay taxes, to absent themselves from military conscription, and in other ways to boycott the Russian government for its high-handed treatment of the Duma. For this he was tried and imprisoned. But he remained to the end an influential leader of progressive political thought in Russia. Muromtsev was the author of various works on jurisprudence. See RUSSIA.

MURPHEY, ARCHIBALD DE BOW (1777-1832). An American jurist, born in Caswell Co., N. C. He was educated at the University of North Carolina. He served there as a tutor and then as professor of ancient languages until 1802, when he was admitted to the bar. From 1812 to 1818 he was a member of the State Senate. While in this body he was a member of the committee appointed in 1816 to consider the establishment of a system of public schools, and at the session of 1817 submitted an elaborate plan which, while not adopted, formed the groundwork for the later attempts. In 1818 he was elected a judge of the Superior Court and was designated to sit on the Supreme bench during three terms in 1819-20. He persuaded the State to attempt an elaborate system of canals and harbor improvements. In 1822 he secured a share of the Tennessee land warrants for the University of North Carolina and thus saved that institution from ruin. He published *Reports of Cases in the Supreme Court of North Carolina* (3 vols., 1821-26).

MURPHY, ARTHUR (1727-1805). An Irish actor and playwright, born at Clomquin, Roscommon. He studied at the English college at St. Omer in France (1738-47), started the *Gray's Inn Journal* (1752-54) in imitation of Addison's *Spectator*, and in 1754 appeared at Covent Garden as Othello. Beginning with *The Apprentice* (1756), he wrote many farces and clever satires. Among his many miscellaneous works are an edition of Fielding with a memoir (1762), an essay on Dr. Johnson (1792), a translation of Tacitus (1793), and a *Life of Garrick* (1801). His plays and early essays were collected (8 vols., London, 1786), and his life was written by J. Foot (ib., 1811).

MURPHY, CHARLES FRANCIS (1858-). An American political leader, born in New York City. He was educated in the public and parochial schools, became interested in politics as a young man, and gained a large personal acquaintance through his success as an athlete and as organizer and member of the Sylvian Club. He became the owner of a series of saloons

which he claimed were practically poor men's clubs. In these as elsewhere he demonstrated remarkable ability in political organization. In 1891 he was made the Tammany Hall leader of his assembly district. From 1897 to 1901 he was one of the New York commissioners of docks and ferries, in 1900 being chosen treasurer of the board. After two years as chairman of Tammany Hall and on the retirement of Croker in 1902, Murphy was chosen to succeed him as chief. In 1903 and 1905 he successfully directed the campaigns which elected and reelected George B. McClellan to the mayoralty. He opposed the nomination of Parker for President in 1904. It had been Murphy's policy to apply for the support of the independent Democrats, but in 1906, when he supported William R. Hearst for Governor, many independent Democrats voted with the Republicans for Hughes. The result was interpreted as a severe defeat for Murphy. In 1909 Tammany Hall nominated Judge Gaynor for mayor. After a campaign of great bitterness, in which Murphy was accused of corruption and of being an evil influence in politics, Gaynor was elected, but the remainder of the ticket was defeated by the fusionists. Many thought that Murphy would be forced to retire because of this defeat, but he continued as chief. In the following year the party elected Dix Governor, and Murphy's power was supposed by some to have been extended from the city throughout the State. During the succeeding years there were scandals regarding highway and canal contracts, and Tammany Hall was sharply criticized. Boss rule became a State and national issue, and Murphy was frequently held up as an example of the vicious boss. In 1912 he favored Harmon and Clark successively for the presidential nomination, but supported Wilson after the convention acted. He was elected presidential elector in the same year. In State affairs he apparently stood passive in the nomination of William Sulzer. After the latter's election, however, they became involved in disputes, and Murphy was alleged to have been the real power in the impeachment of the Governor in 1913—a trial which scandalized the whole country. In 1913 Tammany nominated Edward E. McCall for mayor, and a fierce campaign followed, in which Murphy was assailed furiously. This, as well as the gubernatorial election of the following year, went heavily against the organization, but Murphy remained in power. See the articles on the politicians herein mentioned; also TAMMANY HALL.

MURPHY, EDGAR GARDNER (1869-1913). An American clergyman and author, born at Fort Smith, Ark. He graduated from the University of the South in 1889 and for 12 years was a minister of the Protestant Episcopal church. After 1903 he was engaged exclusively in educational and social work, serving as executive secretary of the Southern Education Board, vice president of the Conference for Education in the South, organizer and secretary of the Southern Society for Consideration of Race Problems and Conditions in the South, and organizer and first secretary of the National Child Labor Committee. He retired on account of ill health in 1908. Besides contributions to periodicals he is author of *Words for the Church* (1896); *The Larger Life* (1896); *Problems of the Present South* (1904; 2d ed., 1909); *The Basis of Ascendancy* (1909).

MURPHY, FRANCIS (1836-1907). An American temperance evangelist, born in Wexford, Ireland. He served in the Federal army during the Civil War. Beginning in 1870 at Portland, Me., he started temperance reform clubs throughout that State, and was their first president. His headquarters were in Pittsburgh, Pa., and after his first addresses there in 1876, 45,000 people signed the pledge. He labored also in Britain, and was chaplain in the Spanish-American War. During the course of his temperance labors in America and abroad Murphy is said to have induced 10,000,000 people to sign the pledge.

MURPHY, HENRY CRUSE (1810-82). An American politician and historian, born in Brooklyn, N. Y. He graduated at Columbia College in 1830, studied law, and was admitted to the bar in Brooklyn, where he became city attorney and, in 1842, mayor. The next year he became a member of Congress. At the expiration of his term he was elected a delegate to the New York State Constitutional Convention of 1846. In 1847 he was again sent to Congress, and in 1852 was a candidate for the Democratic nomination for President. From 1857 to 1861 he was Minister to Holland, and after his return he served for six successive terms in the New York State Senate. He is perhaps best known for his researches in the early Colonial history of New York. He translated De Vries's *Voyages from Holland to America, 1632 to 1644* (1853). During his residence at The Hague as American Minister he printed for private distribution two monographs, *Henry Hudson in Holland Origin and Objects of the Voyage which Led to the Discovery of the Hudson River* (1859) and *Jacob Steendam, Nooh Yasater. A Memoir of the First Poet in New Netherlands, with his Poems, Description of the Colony* (1861). The latter of these was reprinted in his *Anthology of New Netherland, or, Translations from the Early Dutch Poets of New York, with Memoirs of their Lives*, issued by the Bradford Club in 1875.

MURPHY, JOHN BENJAMIN (1857-1916). An American surgeon, born at Appleton, Wis. He graduated from Rush Medical College in 1879 and established his practice in Chicago. In 1882-84 he studied in Germany. He was professor of surgery at the Northwestern University Medical School after 1895 and at the Chicago Postgraduate Medical School. In 1911 he was president of the American Medical Association. Murphy became known through success in autogenous bone grafts, intestinal anastomosis and approximation without sutures by means of a special button (Murphy's button, 1892), union of the femoral artery severed by a gunshot wound, and through many other operations. He edited *General Surgery* for the "Practical Medicine Series" (1901 et seq.). *The Clinics of John B. Murphy, M.D., at Mercy Hospital, Chicago*, is a publication appearing periodically.

MURPHY, JOHN FRANCIS (1853-). An American landscape painter. He was born in Oswego, N. Y., had early to struggle with poverty, and studied art by himself. He first exhibited in 1876 at the National Academy, of which he was elected a member in 1887. At first influenced by Wyant and Inness, after 1900 he attacked the modern problems of light and air, thus combining the old and new theories

of landscape painting. His chief characteristics are extreme refinement and charm, poetic sentiment, and beauty of surface. His composition is simple and his rendering of soil unique. A past master of values, he prefers the quiet and subdued aspects of nature. Good examples of his work are "October" (Corcoran Gallery, Washington), "The Path to the Village" and "Indian Summer" (both in the National Gallery, Washington); "The Old Barn" (Metropolitan Museum, New York), "The Hill Top" (Art Institute, Chicago), "Afternoon Lights on the Hills" (Carnegie Institute, Pittsburgh); "Neglected Lands" (Buffalo Academy). He received numerous awards, including a gold medal at Charleston (1902) and the Inness medal in 1910.

MURPHY, LAMBERT (1885-). An American tenor, born at Springfield, Mass. While pursuing an academic course at Harvard University, he studied singing under T. L. Cushman in Boston from 1904 to 1908. Having filled positions in several important churches in Boston, Brookline, and Fairhaven, he went to New York in 1910 as soloist of St. Bartholomew's. After further study under Isidore Luckstone, he was engaged (1911) as a member of the Metropolitan Opera. Murphy made his reputation chiefly as a concert singer, appearing at many of the great festivals.

MURPHY, MARTIN (1832-). A Canadian civil engineer. He was born in County Wexford, Ireland, was educated at the public schools and privately, and began engineering work in 1852 on the Midland Great Western Railway. He was resident engineer of the Dublin, Wicklow, and Wexford Railway from 1862 to 1868, when he went to Canada and served for a year as engineer for the city of Halifax. He was chief engineer for the survey of projected Nova Scotia railways in 1870-71 and contracted for the building of Intercolonial Railway bridges in 1871-74. For 30 years (1875-1905) he was provincial engineer for Nova Scotia, and in 1906 was appointed government inspecting engineer of the National Transcontinental Railway, western division. He was president of the Nova Scotia Institute of Science (1882-83) and of the Canadian Society of Civil Engineers (1902). His views on and illustrations of bridge work won high recognition from the Engineering Congress at the World's Fair, Chicago (1893).

MURPHY, ROBERT (1806-43). A British mathematician, born at Mallow, County Cork, Ireland. He was early self-taught, but was sent by friends to Caius College, Cambridge, where he graduated B.A. and was elected a fellow in 1829. His fellowship was sequestered for his creditors in 1832. In 1838 he became examiner in mathematics and natural philosophy at London University. Murphy contributed important papers to the *Cambridge Philosophical Transactions* (1831-36), to the *Philosophical Magazine* (1833-42), and to the *Philosophical Transactions* (1837); and published also *Elementary Principles of Electricity, Heat, and Molecular Actions* (1833) and *A Treatise on the Theory of Algebraical Equations* (1839; reprinted, 1847).

MURPHYSBORO. A city and the county seat of Jackson Co., Ill., 87 miles by rail southeast of St. Louis, Mo., on the Big Muddy River and on the Illinois Central, the Mobile and Ohio, and the St. Louis, Iron Mountain, and

Southern railroads (Map: Illinois, F 10). It is the centre of a rich farming district producing wheat and corn and containing considerable mineral wealth, particularly deposits of shale and bituminous coal. There are railroad shops, coal mines, and manufacturing of flour, lumber, ice, beer, foundry and machine-shop products, shoes, building and paving brick, etc. Murphysboro contains the St. Andrew's Hospital and has a fine high school. Gen John A. Logan (q.v.) was born here. The city has adopted the commission form of government. Pop., 1900, 6463; 1910, 7485.

MURRAIN, mŭr'in (OF. *morine*, from Lat. *mori*, Skt. *mar*, to die). A general term loosely used to designate a variety of diseases of domestic animals, but more correctly restricted to the vesicular epizootic, popularly known as foot-and-mouth disease. See TEXAS FEVER.

MURRAY. A city in Salt Lake Co., Utah, 6 miles south of Salt Lake City, on the Oregon Short Line, the Salt Lake, and the Denver and Rio Grande railroads. The city hall and high school are both attractive buildings. There are smelters and refineries, canning factories, flour mills, lumber-finishing plant, candy factory, fish hatcheries, and brick and tile works. The water works and one of the electric-light plants are owned by the city. Pop., 1910, 4057.

MURRAY, ALEXANDER (1755-1821). An American naval officer, born at Chestertown, Md. At the outbreak of the Revolution he received a commission in the navy, but while waiting for a ship served, during 1776-77, as lieutenant and captain in the First Maryland Regiment and participated in the operations around New York. In the latter part of 1777 he commanded the *Revenge* with letters of marque to prey on British commerce. He was captured, but after exchange served on board the *Trumbull* and was again captured. When exchanged again he commanded a privateer and afterward served on the *Alliance*. When the navy was reorganized in 1798 he was one of the first six captains appointed, and commanded the *Montezuma* during the troubles with France. He served in the Mediterranean during the war with Tripoli. In 1821 he was placed in command of the Philadelphia Navy Yard, and died shortly afterward, being at that time the senior officer of the navy.

MURRAY, ALEXANDER (1775-1813). A linguist, born at Dunkitterick, Kildubrightshire. He graduated at Edinburgh University, became parish minister of Urr in his native shire (1806) and professor of Oriental languages in Edinburgh University (1812). He died April 15, 1813. Murray edited in a thorough manner Bruce's *Travels* (1805; new ed., 1813), wrote for his students *Outlines of Oriental Philology* (1812); and contributed to the *Edinburgh Review*. After his death appeared his chief work, *History of the European Languages*, with a memoir and the fragment of an autobiography (2 vols., Edinburgh, 1823).

MURRAY, ALEXANDER STUART (1841-1904). A distinguished English archaeologist, born near Arbroath. He was educated at the University of Edinburgh and in Berlin. In 1867 he was appointed assistant in the department of Greek and Roman antiquities of the British Museum and in 1886 keeper of the same. In 1894-96 he directed excavations in Cyprus. His publications include: *Manual of Mythology* (1873; reedited, 1895); *a History of Greek Sculpture*

(1880-83, new ed., 1890); *Handbook of Greek Archaeology* (1892); *Designs from Greek Vases* (1894); *Terra-Cotta Sarcophagi* (1898); "Greek Bronzes," in the *Portfolio* (1898); *Excavations in Cyprus*, published by the British Museum (1900); *Sculptures of the Parthenon* (1903).

MURRAY, ALMA (1854-). An English actress, born in London, the daughter of an actor, Leigh Murray. Her first appearance was at the Olympic in 1870 as Sacharissa in *The Princess*. She played at the Lyceum with Irving in 1879 and at different West End theatres from 1882 to 1897, and took a prominent part in the few attempts to produce the dramas of Shelley and Browning, playing Beatrice in *The Cenci* (1886) and Mildred in *A Blot on the 'Scutcheon* (1888). After 1899 she gave recitations and became a teacher of elocution and acting. Alma Murray married Alfred Forman, who translated several of Wagner's librettos. She played Mrs. Maylie in *Oliver Twist* (1905, 1912), the Queen in *Pelleas and Melisande* (1911), Lady Dedmond in *Galsworthy's Fugitive* (1913), and Mrs. Fynsford-Hill in Shaw's *Pygmalion* (1914).

MURRAY, DANIEL ALEXANDER (1862-). A Canadian mathematician. He was born in Colchester County, Nova Scotia, and was educated at Dalhousie and Johns Hopkins universities and in Berlin and Paris. He was successively associate professor of mathematics at New York University, instructor at Cornell, professor at Dalhousie University, and, after 1907, professor of applied mathematics at McGill. He published *Introductory Course in Differential Equations* (1897), *An Elementary Course in the Integral Calculus* (1898), *Plane and Spherical Trigonometry* (1902); *Essentials of Trigonometry and Mensuration* (1909); *Elements of Plane Trigonometry* (1911).

MURRAY, DAVID (1830-1905). An American educator. He was born at Bovina, Delaware Co., N. Y., to which his parents had come from Scotland in 1816. He graduated from Union College in 1852. The following year he became assistant in the Albany Academy, and in 1857 was advanced to the principalship. In 1863 he accepted the chair of mathematics and physics in Rutgers College. Having assisted the Japanese Embassy in 1872 in investigating the educational systems of the United States and other countries and preparing statistics thereon, he was invited by Japan to assume the supervision of its educational affairs. He removed to that country and was occupied for six years in these duties. At the time of his return to America in 1879 he was decorated by the Emperor with the Order of the Rising Sun. In 1880 he became secretary of the regents of the University of the State of New York, and held this post nine years. He published several addresses, and was the author of *Manual of Land Surveying* (1872); an introductory chapter to *Outlines of the History of Japanese Education* (1876); *Japan* (1894, rev. ed., by Baron Kaneko, 1906), in the "Story of the Nations Series"; *History of Education in New Jersey* (1899).

MURRAY, DAVID (1849-). A Scottish landscape painter. He was born in Glasgow and studied at the Glasgow Art School. After devoting 11 years to business he turned to landscape painting and in 1882 removed to London. Elected an Academician in 1903, he exercised a

marked and salutary influence on contemporaneous British landscape painting. His color, especially in his earlier works, is fresh and brilliant, his handling dexterous, and he delights in delicate detail and movement. His subjects are chiefly landscapes of Scotland, Picardy, southern England, and the Italian lakes, and marines from the Dorset coast. Among the best known are "My Love has Gone a-Sailing" and "In the Country of Constable" (both in the Tate Gallery), "Loch Linne near Port Appin," "River Road," and a "View of Windsor."

MURRAY, DAVID CHRISTIE (1847-1907). An English novelist, born at West Bromwich, Staffordshire. He was educated at a private school. He began his career as a reporter on the Birmingham *Morning News*, and in 1873 went to London, where he joined the staffs of the *Daily News* and the *World*. During the Russo-Turkish War he was a special correspondent for the *Times*, and subsequently he traveled widely and lectured. In 1879 he published in *Chambers's Journal* his first long novel, *A Life of Atonement*. Other books are: *Joseph's Coat* (1881), *Tal Strange* (1882); *Time's Revenge* (1893), *In Direst Peril* (1894), *A Rogue's Conscience* (1896), *Tales in Prose and Verse* (1898); *A Race for Millions* (1898), many other novels, *A Novelist's Note Book* (1887), *Guesses at Truths, Ethical, Social, Political, and Literary* (1908), essays originally contributed to the *Referee*, under the pseudonym Merlin; *Recollections* (1908).

MURRAY, LORD GEORGE (c.1700-60). A Scottish Jacobite general, son of the first Duke of Athol. His father was loyal to the house of Hanover, but Lord George followed his elder brother, the Marquis of Tullibardine, into the Jacobite uprising of 1715, commanded a battalion at Sheriffmuir, and made his escape to France the following year. He was living in Scotland at the time of the rebellion of 1745, and was the most capable of Prince Charles's generals. To Lord George Murray's personal bravery, sound judgment, and skill in handling undisciplined troops must be attributed the chief credit for the Jacobite victories at Prestonpans and Falkirk, as well as for the Highlanders' safe retreat from England after the raid to Derby. Murray escaped to the Continent when the cause was lost and died in Holland.

MURRAY, GEORGE HENRY (1861-). A Canadian statesman of Scottish parentage, born at Grand Narrows, Nova Scotia. He began his education in his native place, finished it at Boston University, was called to the bar in 1883, and practiced his profession at North Sydney, Nova Scotia. He was appointed a member of the Nova Scotia Legislative Council in 1889, but resigned in 1891, was an unsuccessful Liberal candidate for the House of Commons, was reappointed to the Legislative Council the same year and also became a member, without portfolio, of the provincial cabinet of William Stevens Fielding (q.v.). In 1896 he became Premier and Secretary for his native province, a position he still retained in 1915. He was a delegate to the Interprovincial Conference at Ottawa in 1906.

MURRAY, (GEORGE) GILBERT (AIMÉ) (1866-) A British classical scholar, born at Sydney, New South Wales. He went to England in 1877 and was educated at Merchant Taylors' School, London, and at St. John's Col-

lege, Oxford. In 1880-99 he was professor of Greek at the University of Glasgow and after 1908 regius professor of Greek at Oxford. He received honorary degrees from Glasgow, Birmingham, and Oxford. Gilbert Murray's publications include a *History of Ancient Greek Literature* (1897), *Liberalism and the Empire* (1900), part author, a text edition of Euripides, *Fabulae*, in three volumes (1901, 1904, 1910), *The Rise of the Greek Epic* (1907; 2d ed., 1911), *Four Stages of Greek Religion* (1913), *Euripides and his Age*, in "Home University Library" (1913); *Hamlet and Orestes* (1914), and two plays, *Carlyon Sahab* (1899) and *Andromache* (1900). Murray is perhaps best known for his admirable verse translations of various plays of Euripides: the *Hippolytus* and the *Bacchae* (together with the *Progs* of Aristophanes, 3d ed., 1906), the *Medea*, *Trojan Women*, and *Electra* (1905-07), *Iphigenia in Tauris* (1910), *The Rhesus* (1913). These were presented at the Court Theatre, London. In the United States Granville Barker and his wife, Lillah McCarthy (qq.v.), gave outdoor performances of *The Trojan Women* and *Iphigenia in Tauris* at various colleges (1915). Murray also translated Sophocles' *Edipus Rex* (1910).

MURRAY, (EUSTACE CLARE) GRENVILLE (1824-81). An English journalist, the illegitimate son of Richard Grenville, second Duke of Buckingham. After studying at Magdalen College, Oxford, and at the Inner Temple, he entered the diplomatic service and held various posts at Vienna, Hanover, Constantinople, and Odessa. Returning to England in 1868, he founded the *Queen's Messenger* (1869), the first of the English satirical society papers, and in the same year he was publicly horsewhipped by Lord Cairington, whose equanimity he had seriously disturbed. Driven from England, he settled in Paris, where he figured as the Comte de Rethel d'Aragon, borrowing the title of his Spanish wife. He was one of the pioneers in the gossip and scandal of modern journalism. Among his separate publications are: *The Roving Englishman* (1854), *Round about France* (1878); *Side Lights on English Society* (1881), containing a mock dedication to the Queen.

MURRAY, HUGH (1779-1846). A Scottish geographer, born at North Berwick. Between 1804 and 1814 he wrote several works of fiction and two philosophical works, but after 1816, when he became a fellow of the Royal Society of Edinburgh, he applied himself to the study of geography. He was chiefly noted for his share in the *Encyclopædia of Geography* (1834). He also compiled historical or geographical works upon *The Southern Seas* (1826); *Polar Seas* (1830), *Africa* (1830); *British India* (1832); *China* (1836), *British America* (1839), *The United States* (1844).

MURRAY, JAMES (1719-94). The first British Governor of Canada. He was the fifth son of Alexander, fourth Lord Elihan, and entered the army about 1740. In 1757 he was sent with his regiment to America, where he commanded a brigade in the siege of Louisburg in 1758, and led the left wing of Wolfe's army in the battle on the Heights of Abraham, Sept. 13, 1759. The next year he successfully defended Quebec against an attack by a superior French force under De Lévis, and later in the same year assisted General Amherst in reducing Montreal. He was appointed Governor of

Quebec in October, 1760, and of all Canada in 1763, and continued in that position until 1766. He became Governor of Minorca in 1774, was besieged in Fort St Philip in 1781 by the French and Spanish under the Duc de Crillon, and after a desperate defense was forced in 1782 to capitulate. Upon his return to England he was tried by a court-martial, but was acquitted. He became a full general in 1783, and died near Battle, in Sussex. For an account of his career in America, consult Francis Parkman, "Montcalm and Wolfe," in *France and England in America*, part vii (Boston, 1884, new ed., 1898).

MURRAY, SIR JAMES AUGUSTUS HENRY (1837-1915). A British lexicographer born at Denholm, Roxburghshire, Scotland. After his elementary studies at home and in Edinburgh he continued his work at London University. Having taught at Hawick, he became master of Mill Hill School, near London, a position which he retained for 15 years (1870-85). Already distinguished as a scholar, he had been twice elected president of the Philological Society (1878-80, 1882-84). For that society and for the Oxford University Press he assumed, in 1879, the editorship of the *New English Dictionary on Historical Principles* (10 vols., 1888 et seq.), the most exhaustive work in lexicography ever attempted in any language. In 1885 Dr Murray moved from Mill Hill to Oxford, where his *Scriptorium* is a notable feature of the city. Before beginning this work he published, notably, *The Dialect of the Southern Counties of Scotland* (1873), the *Complaynt of Scotland* (1874), and the *Romance and Prophecies of Thomas Erceldoune* (1875). In 1884 he received a civil-list pension of £270, in 1900 was chosen Romanes lecturer at Oxford, and in 1908 was knighted. He was honored by degrees from some of the great universities of the world. A full account of the beginning of the dictionary and of its making is to be found in Dr Murray's address to the Philological Society (1879). See **DICTIONARY**.

MURRAY, or **MORAY**, mūr'ī, JAMES STUART, EARL OF (1531-70). A Scottish statesman. He was the natural son of James V of Scotland and half-brother of Mary, Queen of Scots. Destined for an ecclesiastical life, he was educated from 1541 to 1544 at St Andrews, and early received ecclesiastical benefices. He accompanied his sister Mary to France in 1548, returning the following year to gain as a youth military experience and renown by driving a strong party of English from the coast with great loss. It is probable that he began to sympathize with Protestants as early as 1552, and it is certain that he was an attendant on Knox's lectures in 1555, and joined with others in urging his return from Geneva the following year. From 1556 on he was the consistent leader of the Scottish reformers, and after 1558 till his death he was the most powerful single factor in Scottish politics. He was present at Mary's marriage to the Dauphin of France, afterward Francis II, and was sent to France in 1561 to invite the widowed Mary, after the death of the Queen Regent, to return to Scotland as its Queen. For a few years Lord James Stuart, as Mary's chief minister and adviser, seemed to subordinate his own ambition to the good of Scotland, the preservation of his religion, the future union of England and Scotland, and the success of his sister's reign. In 1562 Mary created him Earl of Mar, but he

soon resigned this title to become the Earl of Murray. When it became evident that she would not be acknowledged by Elizabeth as her successor, Mary turned to a Catholic alliance, which forced Murray to break with his sister, and a series of intrigues and counterintrigues began. At first inclined to favor the marriage of Mary with Darnley, he soon saw that it meant Catholic supremacy, hence he opposed it finally by an appeal to arms, but was defeated and forced to take refuge in England (1565). In 1566, after intriguing with Bothwell, professing at the same time friendship for Darnley, and being cognizant, at least, of the plan to murder Rizzio, Murray returned to Edinburgh to regain his power. For the moment outwardly reconciled to his sister, he went to France, but returned shortly at the request of the lords, who had taken arms, to become Regent of the Kingdom. After Mary's escape from prison he defeated her forces at Langside, near Glasgow, 1568, and on her flight to England he became one of the commissioners sent to that country to conduct the negotiations against her. Later, however, he urged Elizabeth to permit Mary to return to Scotland, but was assassinated in 1570 by Hamilton of Bothwellhaugh before his plans had matured. He was a cold, ambitious man, endowed with great abilities, personally moral, but in politics without scruples. Consult authorities cited under **MARY STUART**.

MURRAY, SIR JAMES WOLFE (1853-). A British army officer. He was educated at Harrow and Woolwich and entered the Royal Artillery in 1872. He served in the Ashanti campaign of 1895 and in Natal in 1899-1900; was quartermaster-general in India in 1903-04 and master general of ordnance in 1904-07; commanded the Ninth Division in India in 1907-11, then commanded the Imperial troops in South Africa, and in 1915 succeeded French as chief of the British Imperial general staff. Murray was made K.C.B. in 1900.

MURRAY, JOHN (1741-1815). The founder of the Universalist body in America. He was born at Alton, England, Dec. 10, 1741. At the age of 11 his parents removed to Cork, Ireland. He became a Methodist under the preaching of Wesley and Whitefield. Having read a book by James Rely, a Universalist, he was led to adopt his views, and for this was excommunicated at Whitefield's Tabernacle, London. Persecution for opinion, pecuniary embarrassment, and grief for the loss of his wife caused him to seek retirement in America. He preached his first sermon in America Sept. 30, 1770, in a small church, in an obscure place in New Jersey, called Good Luck. Believing fully in the doctrine of universal salvation, he gave himself to earnest labor, first in New Jersey and New York, afterward in Newport, Providence, Boston, Portsmouth, Norwich, and other places in New England. In 1774 he fixed his residence in Gloucester, Mass., where he was represented as a Papist and a secret emissary of Lord North in the interest of the English ministry. He was abused, and by a vote ordered to leave the town, but the interference of powerful friends saved him and he was allowed to remain. In 1775 he was appointed chaplain of a Rhode Island brigade encamped near Boston. Ill health compelled him to leave the army, and he returned to Gloucester, where he was settled over a society of Universalists. He was instrumental

in the organization of a convention of his sect, which met at Oxford, Mass., September, 1785, and took the name of Independent Christian Universalists. In 1793 he was installed pastor of a society of Universalists in Boston, where he remained till his death, Sept. 3, 1815. He published *Letters, and Sketches of Sermons*, three volumes, and an autobiography (1813), continued by his wife (9th ed by Demorest, 1870). Consult R. Eddy, *Universalism in America*, vol. 1 (Boston, 1886).

MURRAY, originally **MACMURRAY**, JOHN (1745-93). The first of four great English publishers, John MacMurray, of the stock of the Murrays of Athol, was born in Edinburgh. Having served as lieutenant of marine (1762-68), he retired on half pay and began to publish and sell books in London. John MacMurray purchased the bookselling business of Paul Sandby, opposite St. Dunstan's Church, London, and, dropping the Scottish prefix, became a bookseller at 32 Fleet Street. He brought out the *English Review* (1783-96), published, among other notable books, the first two volumes of the elder Disraeli's *Curiosities of Literature*, and was one of the original proprietors of the *Morning Chronicle*. He was succeeded in due time by his son JOHN (1778-1843). One of the earliest hits of John the second was Mrs. Rundall's *Domestic Cookery* (1808), which had been through 65 editions by 1841. With the cooperation of Scott, Canning, and others, he founded the *Quarterly Review*, a Tory organ, in opposition to the Whig *Edinburgh Review*, then at the height of its influence. The first number was published Feb. 1, 1809, under the editorship of William Gifford. The new periodical was completely successful, and brought Murray into communication not only with the chief writers but also with the conservative statesmen of the time. A still more fortunate acquaintance was that with Lord Byron, whose *Childe Harold* (first two cantos) was published by Murray in 1812. Murray now (1812) removed from Fleet Street to Albemarle Street. Almost all the literary magnates of the day flocked to Murray's house, and it was there that Scott and Byron first met. As Byron's publisher he made fame and a fortune, and he paid the poet handsomely—nearly £20,000 all told; and his dealings with Crabbe, Moore, Campbell, and Irving were princely. The second John Murray was succeeded by his son, JOHN MURRAY the third (1808-92). The long-famous Murray guide-books to various European countries were from his pen, and many great works in history, biography, travel, art, and science were issued by him. Among his successes were Livingstone's *Travels and Last Journals*, Smiles's *Life of George Stephenson*, and Darwin's *Origin of Species by Natural Selection*. At his death he was succeeded by his son, the fourth John Murray (1851-), who, with his brother A. H. Hallam Murray, conducted the business. Consult S. Smiles, *A Publisher and his Friends* (2 vols., London, 1891), for the second John Murray; and three articles by F. Espinasse, "The House of Murray," in the *Critic* (ib., 1860).

MURRAY, SIR JOHN (1841-1914). A British naturalist and oceanographer. He was born at Coburg, Ontario, studied at Victoria College there and at the University of Edinburgh, and devoted himself to natural science. In 1868 he went through the Arctic regions on a whaler

studying fauna and flora; from 1872 to 1876 was a naturalist of the *Challenger* expedition; and, after six years' service as assistant, became editor in 1882 of the scientific reports of the *Challenger* voyage. He contributed to the *Narrative of the Cruise of H.M.S. Challenger* (1882-85) and wrote the *Challenger Report on Deep-Sea Deposits*, with Renard (1890). He participated in the *Michael Sars* North Atlantic expedition in 1910, gathering material for *The Depths of the Ocean* (1912). He published also *The Ocean: A General Account of the Science of the Sea* (1913). Murray was knighted in 1898.

MURRAY, JOHN. See DUNMORE, JOHN MURRAY, EARL OF.

MURRAY, JOHN CLARK (1836-). A Canadian writer on philosophy and psychology, and a university professor, born at Paisley, Scotland. He studied at Glasgow, Edinburgh, Göttingen, and Heidelberg. In 1862 he became professor of mental and moral philosophy in Queen's University, Kingston, Canada, and in 1872 he was called to a similar chair at McGill University, Montreal. Murray received the degree of LL.D. from Glasgow. He is author of *An Outline of Sir William Hamilton's Philosophy* (1870); *Ballads and Songs of Scotland* (1874), *Memoir of David Murray* (1880), *Handbook of Psychology* (1885); *Solomon Maimon: An Autobiography*, translated from the German (1888); *An Introduction to Ethics* (1891), *An Introduction to Psychology* (1904); *A Handbook of Christian Ethics* (1908).

MURRAY, LINDLEY (1745-1826). An English grammarian of American birth, born at Swatara, Lancaster Co., Pa., April 22, 1745. He was educated at an academy of the Society of Friends, and, on his father's removal to New York, was placed in a counting house, from which he escaped to a school in New Jersey. He afterward studied law and had a good practice in New York. During the Revolutionary War he engaged in trade with such success as to accumulate a handsome fortune. His health failing, he went to England (1784) and purchased an estate at Holdgate, near York, where he devoted himself to literary pursuits and botany. His garden rivaled the Royal Gardens at Kew. In 1787 he published his *Power of Religion on the Mind*, which passed through 20 editions. His *Grammar of the English Language* was issued in 1795, and was followed by *English Exercises*, the *Key*, the *English Reader* (1799), and a *Spelling Book* (1804), which went through some 50 editions. Murray died Feb. 16, 1826. Consult the *Memoir of Murray*, containing an autobiography by Frank (York, 1826), and *Life by Eggle* (New York, 1885).

MURRAY, or **MORAY**, mŭr'ī, SIR ROBERT (?-1673). A Scottish statesman. He was educated at St. Andrews University, entered the French army, and, through the influence of Richelieu, rose to the rank of colonel. He was chosen secret envoy to negotiate a treaty between Scotland and France, and while at Newcastle in December, 1646, formed a plan for the escape of Charles I., which came to nothing through the King's irresolution. In 1651 he was appointed justice clerk, and soon afterward was made a Privy Councillor and a Lord of the Session, but never took his seat upon the bench. After the Restoration, as Lord of Exchequer and Deputy Secretary he was one of the triumvirate, the other two members of which were Lauderdale and the King, that ruled Scotland

from 1663 till 1670. He was one of the founders of the Royal Society, the oldest scientific society in Great Britain. As a chemist and musician he had a good reputation in his time.

MURRAY, WALTER CHARLES (1866-). A Canadian educator. He was born at Studholm, New Brunswick, and was educated at New Brunswick, Edinburgh, and Berlin universities. He was professor of philosophy and economics at New Brunswick University (1891-92). George Munro professor of philosophy and lecturer on education at Dalhousie University (1892-1908), and in the latter year was appointed president of the provincial university of Saskatchewan. He was elected a director of the Dominion Educational Association. He published *Studies in Mind Growth* (1904) and *Local Government in the Maritime Provinces* (1909).

MURRAY, WILLIAM, first EARL OF MANSFIELD. An English jurist. See MANSFIELD, WILLIAM MURRAY, first EARL OF.

MURRAY, WILLIAM HENRY HARRISON (1840-1904). An American Congregational clergyman, lecturer, and author. He was born at Guilford, Conn., and graduated from Yale in 1862. In Connecticut he held pastorates at WASHINGTON (1863-64), Greenwich (1864-66), and Meriden (1866-68). From 1868 to 1874 he was pastor of the Park Street Church, Boston. In 1869-73 and in 1875-78, while pastor of the Independent Congregational Church, he gave several series of popular sermons, or Sunday evening lectures, before large audiences in Music Hall, Boston, published as *Music Hall Sermons* (2 vols., 1870-73). Subsequently he withdrew from the ministry and followed a varied career in business, lecturing, and writing. His writings on life in the woods and mountains, which brought him the nickname of "Adirondack Murray," include *Adventures in the Wilderness, or Camp Life in the Adirondack Mountains* (1868); *The Perfect Horse* (1873); *Words Fitly Spoken* (1873); *Daylight Land* (1888). His *Complete Works*, including a number of "Adirondack Tales," were published at Hartford in 1900 (7 vols.). Consult H. V. Radford, *Adirondack Murray* (New York, 1905).

MURRAY, WILLIAM VANS (1762-1803). An American diplomat, born at Cambridge, Somerset Co., Md. He received a classical education and went to London, where he studied law for two years in the Inner Temple. Returning to Maryland in 1785, he was admitted to the bar, and began the practice of his profession, in which he soon attained prominence. From 1791 to 1797 he was a Federalist member of Congress. In 1797 he was appointed by President Washington United States Minister to the Netherlands, and in 1799, with Oliver Ellsworth (q.v.) and William R. Davie, was sent to Paris to negotiate a treaty which should adjust the difficulties that had brought France and the United States to the verge of war. The successful negotiation of the convention signed at Paris, Sept. 30, 1800, was said to be largely the work of Murray. He was the author of a valuable brief treatise on *The Constitution and Laws of the United States*.

MURRAY BAY, or **MALBAIE**. A summer resort and the capital of Charlevoix County, Quebec, Canada, on the left bank of the St. Lawrence River, about 80 miles northeast (direct) of Quebec, with which it has steam-

boat communication (Map: Quebec, H 3). Situated on the Murray estuary which forms the bay, it is the principal watering place on the north shore of the St. Lawrence, and is much frequented for its scenery, invigorating air, bracing though cold bathing, its boating, and fishing. It has county buildings, a Roman Catholic convent, and a boys' college. The town, of which lumber, flour, and carding mills, together with cheese factories, are the chief manufacturing establishments, is at the mouth of the Murray River, the dependent summer colonies being at Pointe à Pic (population, in 1911, 617) and Cap à l'Aigle, the extremities of the bay, 3 miles distant. It was one of the stations for United States prisoners of war in 1776. Pop., 1901, 826, 1911, 1449.

MURRAY RIVER. The principal river of Australia, draining, together with the Darling, practically the whole southeastern quarter of the continent. It rises in the Australian Alps near the east boundary of Victoria, and flows for two-thirds of its course northwestward, forming the boundary between Victoria and New South Wales (Map: South Australia, F 5). After entering South Australia it makes an abrupt turn to the south and enters the Indian Ocean through Encounter Bay, 40 miles southeast of Adelaide. Its length is about 1500 miles. For the first 60 miles of its course it passes between precipitous rocky cliffs in one place, known as the Murray Gates, reaching the height of 3000 feet, while some of the highest peaks of the continent are close to its banks. After passing through the Gates the hills become gradually lower, and finally the river enters the immense Australian plains. Here the Murray is sluggish, with numerous windings, and flanked by lagoons. It receives here scarcely any tributaries except a few very large ones coming from the mountains. Among these are the Murrumbidgee (q.v.), which is longer than the main stream from the point of confluence, and the Darling (q.v.), whose length exceeds that of the entire main stream. During the dry season the river loses by evaporation and shrinks even in its lower course to a width of less than 300 feet, but in winter its volume increases enormously, and great inundations occur. In the wet season it is navigable for small steamers for the greater part of its course as far as Albury, but its mouth, owing to sand bars, is inaccessible for large vessels. There are a number of ports on its shores, whose total shipping probably amounts to more than one and a half million tons annually.

MURRAYSHIRE. A maritime county of Scotland. See ELGINSHIRE.

MURRE, mûr (also *marre*, of uncertain etymology). Any of several species of gull-mot (q.v.).

MURRELET, mûr'lét (dim. of *murre*). Any of several small murrelike birds confined to the North Pacific Ocean. The black-throated, or ancient, murrelet (*Synthliboramphus antiquus*) is a handsome black-and-white bird about 10 inches long. It breeds from Sitka northward, and is found as far south as Oregon in winter. A Japanese murrelet is closely allied to it. The remaining four species represent another genus (*Brachyramphus*) chiefly distinguished by a more slender and less compressed bill. Two of the species are Arctic forms, one coming south to southern California in winter, while the other two occur in southern and Lower California.

MUR'RELL, WILLIAM (1853-1912) An English physician. He was educated at University College, London, where he was scholar and demonstrator (1875-78), at the same time practicing medicine, served as medical examiner at Edinburgh (1882-87) and in the Royal College of Physicians in London (1886-90), and became physician and lecturer at Westminster Hospital. He wrote *Nitroglycerin as a Remedy for Angina Pectoris* (1882), crowned by the French Academy of Medicine in 1885, *What to Do in Cases of Poisoning* (1882, 10th ed., 1907); *Massage as a Mode of Treatment* (1886, 5th ed., 1890), translated into French and German; *Chronic Bronchitis and its Treatment* (1889); *A Manual of Pharmacology and Therapeutics* (1896); *Aids to Materia Medica* (1898-99). *Forensic Medicine and Toxicology* (6th ed., 1903).

MUR'REY. See HERALDRY.

MURRUMBIDGEE, mŭr'ŭm-bij'ĕ. A river of New South Wales, the second largest tributary of the Murray. It rises on the northeast slope of the Australian Alps, in the southeast corner of the state, within 40 miles of the Pacific coast (Map New South Wales, B 4). It flows first northward through a hilly country, then westward through the great plains till it enters the Murray 90 miles, in a straight line, southeast of the mouth of the Darling. Its length is 1350 miles, but, though it is longer than the Murray from the point of confluence, it is not of great commercial importance, owing to its shallowness. During the wet season it is navigable 500 miles for light-draft steamers. Its principal affluent is the Lachlan (q.v.). In 1829 Captain Sturt traced the Murrumbidgee to the Murray, and in 1831 Captain Barker, in search of it, was murdered by the natives.

MURRY. See MORAY.

MUR'SA, or **MURSIA**. The Roman name for Eszék (q.v.).

MURSHIDABAD, mŭr'shĕ-dā-bid'. The capital of a district of Bengal, British India, on the left bank of the Bhagirathi, a branch of the Ganges, 115 miles north of Calcutta (Map-India, F 4). Azimganj, on the opposite side of the river, with ferry communication, is usually reckoned part of Murshidabad. The town covers a great area, several miles in length and breadth, but, having lost much of its former importance as a trade and revenue collection centre, it is no longer fully populated. The buildings are for the most part of mud, but there are several brick structures—mosques and tombs—along the river bank, and centrally situated is the Nizamat Kila, or Nawab's palace, a building of great beauty, completed in 1840. It has many treasures, including jewelry, china, arms, and pictures. The town is on the most frequented water route from Calcutta to the United Provinces. Its trade was formerly of great importance, and its banking connections are still considerable, Jain merchants here being among the wealthiest in India. Institutions include a college for education of the Nawab's family. The rearing of silkworms and the weaving of silk are the chief of many industries, which include ivory carving, the manufacture of gold and silver lace, embroidery, hookah pipes, and musical instruments. Murshidabad was the last Mohammedan capital of Bengal, and after the British annexation remained the capital until 1790, when the administrative seat was settled at Calcutta. Population in 1891, of Murshida-

bad and Azimganj, 35,756, in 1901, of Murshidabad, 15,168, of Azimganj, 13,383, total 28,551.

MURTOS. See MARTOS.

MURU'MURÚ PALM. See ASTROCARYUM
MURVIEDRO. A town in Spain. See SAGUNTO.

MURZUK, mŭr-zŭk', or **MOURZOUK**. The capital of Fezzan (q.v.), in Italian Libya, north Africa, situated in an unhealthy region in lat. 25° 50' N and long 14° 10' E (Map Africa, F 2). It is surrounded by a wall and has an extensive palace. The inhabitants manufacture leather and textiles, it has also a large transit trade, being one of the three chief caravan stations in the interior. The population is estimated at 6500.

MUS, PUBLIUS DECIUS. See DECIUS MUS, PUBLIUS.

MUSACEÆ, mŭ-zā'sĕ-ĕ (Neo-Lat nom. pl. from *Musa*, from Ar *mauz*, banana tree), THE BANANA FAMILY. A family of monocotyledonous plants, almost restricted to the Oriental tropics, from whence many of them have been introduced into the Occidental tropics. This is one of a group of four families which constitute the order Scitamineales (q.v.), an order intercalated between Liliales and Orchidales, at the end of the series of Monocotyledons. Although the plants resemble trees in stature, the apparent stems consist of the long sheathing bases of the leaf stalks, constituting what is called a false stem. From the midrib to the margin of the leaf blade are many fine parallel veins. Hence the wind tears the tissue between them and makes the leaves very ragged. The flowers are borne on spadices in cymes or racemes often with bright-colored bracts which are protected by spathes. The fruit is either fleshy or a three-valved capsule. The family contains about 60 species, many of which are exceedingly important for their fruit (especially species of *Musa*) and for their leaf fibres, which are used in cordage and for textile purposes. A very interesting species is the traveler's tree (q.v.) of Madagascar. See BANANA; HEMP, MANILA, PLANTAIN.

MUSÆUS (Lat, from Gk Μουσαῖος, *Mousaios*) 1 A legendary Greek poet and personification of the powers of the Muses. His parents were said to be Eumolpus or Antiphemus and Selene, and in story he was closely connected with Orpheus, of whom he is variously called teacher, son, and pupil. He is especially associated with the Eleusinian mysteries, which he was said to have founded, and many poems apparently connected with this worship, or oracular in nature, were attributed to him. He had no existence, however, outside of legend. 2 A later Musæus, who probably flourished in the sixth century of the Christian era, was the author of a very pleasing amatory poem, in Greek, entitled *Hero and Leander*, discovered in the thirteenth century, of which the first edition was published by Aldus Manutius about 1494, critical edition by C Diltthey (Bonn, 1874). See HERO.

MUSA IBN NUSAIR, mŭ'sā ib'n nŭs-ŭn' (c.660-c 714) An Arab governor of north Africa, who sent Tarik (q.v.) in 711 to make an expedition into Spain, which led to the Moorish conquest of the peninsula. Musa, jealous of the success of his subordinate, crossed himself in 712 with an army of 18,000 men. He made conquest after conquest, but was checked in 713 by

an order of the Caliph to repair at once to Damascus. He left immediately, his son Abdul Aziz taking command. When Musa arrived at Damascus he was deprived of his command, and is said to have been put to death, while his son met his death in his palace at Seville, possibly at the command of the Caliph of Damascus. Consult *Cambridge Medieval History*, vol. ii (New York, 1913).

MUSÄUS, mü-zä'us, JOHANN KARL AUGUST (1735-87). A German writer, best known for his *Volksmärchen der Deutschen* (1782-86), a collection of tales blending genial humor, quaint fancy, and common sense. Musäus was born in Jena, March 29, 1735. He studied theology, became in 1763 tutor of pages at the court of Weimar and in 1770 professor at the Weimar Gymnasium. His literary career began (1760) with a successful parody of Richardson's *Grandison*. Then, after 18 years' silence, he satirized Lavater's whimsical theories in *Physiognomische Reisen* (1778-79). His sprightly and genial *Freund Heins Erschewungen in Holbeins Manier* (1785) are interesting because they show the rising influence of Wieland (qv). He died at Weimar, Oct. 28, 1787, before completing *Straussfedern*, a series of tales. In 1788 appeared the clever skits *Moralische Kinderklapper*. Other posthumous writings were gathered in 1791 with a notice of Musäus by his pupil and relative, August von Kotzebue (Leipzig, 1791). There is a *Life* by Moritz Müller (Jena, 1867). Consult also A. Stein, *Beiträge zur Literaturgeschichte des 18. Jahrhunderts* (Leipzig, 1893).

MUSCÆ VOLITANTES, müs'sä völ'i-tän'téz (Lat., flying flies), MYIODESOPSIA (Gk *μυιόδης*, *myiódēs*, like flies + *opsis*). The term applied to floating grayish spots before the eyes. Whoever will look through a minute pinhole in a card at the clear sky may see floating before his sight a number of translucent tubes or fibres, and many little beads, of which some are separate, some attached to the tubes, and some apparently within them. Some of the tubes or fibres are straight, others looped or twisted, and others again forked. All these objects are bright in the middle, and bounded by fine black lines. The doublings and crossings of the loops or knots in the twisted fibres appear as black points. Though the eye be fixed, these bodies change their position with greater or less rapidity. Now, in ordinary light and vision these objects are usually unobserved, though some persons can easily see them, especially when looking at a bright surface. They are believed to be caused by shadows cast upon the retina by cells (probably embryonic) which exist normally in the vitreous humor. They occur most often with errors of refraction and disturbances of digestion and are apt to be associated with excess of uric acid. A course of alkaline waters, together with the observance of ocular hygiene and the wearing of suitable lenses, generally affords relief. They are of no pathological importance whatever, but may become very annoying to neurasthenic patients. After a sudden movement of the eyes they appear to settle downward. Fixed black spots, not moving at all while the eyes are motionless, are suggestive of actual disease and demand an ophthalmoscopic examination.

MUSCARDINE (Fr. *muscardine*, *muscadin*, It. *moscardino*, *moscadino*, musk lozenge, from *moscato*, ML. *muscatum*, musk, from Lat. *mus-*

cus, musk), or SILKWORM ROT. The fungus *Botrytis bassiana* and also the serious disease of silkworms which it produces. The fungus consists of erect branching threads, with clusters of spores at the ends of short lateral branches. The spores germinate on healthy silkworms, especially those in the last stage before spinning their cocoons. They germinate also on the caterpillars of other lepidopterous insects, and on the common house fly. Diseased worms die suddenly, become discolored, and are soon hard and dry. Within 24 to 36 hours their bodies may be covered with a whitish powder, the spores of the fungus. For the prevention of this disease absolute cleanliness in the breeding house is necessary; rooms should be cleansed and fumigated after an outbreak to prevent infection of the new brood. The fungus *Metarrhizium anisopliae* and the disease which it causes in white grubs and other insects are known as the green muscardine; and the fungus *Sporotrichum globuliferum*, which causes disease in chinch bugs, scale insects, etc., is known as the white muscardine.

MUSCARDINE. See DORMOUSE.

MUSCARINE, müs'ká-rin. See ALKALOIDS.

MUSCAT, müs-kát'. An old name for the Arabian State of Oman (qv.).

MUSCAT, MUSKAT, or MASKAT, müs-kát'. The capital of Oman, in southeast Arabia, situated on the Gulf of Oman (Map: Turkey in Asia (Arabia), J 6). It is fortified and has a good harbor, which makes it one of the most important commercial centres in Arabia, and the port for almost all the trade of Oman, amounting to over \$6,000,000 annually. Its exports consist of dates, mother-of-pearl, dry fish, and salt. It is poorly built and unclean. Its climate is very hot and is considered by some authorities as unhealthy. Its rainfall averages four inches. The population is estimated at 24,000, including the adjacent town of Matra. The inhabitants are mainly engaged in agricultural pursuits. Muscat is the seat of a British Resident and is under British influence. In the sixteenth century Muscat was captured by the Portuguese, but was restored to the ruler of Oman in the seventeenth century.

MUS'CA TEL', or MUSCADEL (OF. *muscadel*, *muscadet*, Fr. *muscadet*, from ML. *muscatellum*, muscatel wine, dim. of *muscatum*, musky odor, from Lat. *muscus*, musk). The name given to many kinds of sweet and strong French and Italian wines, whether white or red. Among the finest are the white Rivesalt and red Bagnol wines from Roussillon, the Lunel from the Pyrenees, and the Lacryma Christi and Carigliano of Naples. See WINE.

MUSCATINE, müs'ká-tēn'. A city and the county seat of Muscatine Co., Iowa, 30 miles southwest of Davenport, on the Mississippi River and on the Chicago, Rock Island, and Pacific, the Chicago, Milwaukee, and St. Paul, and the Muscatine North and South railroads (Map: Iowa, F 3). It is built on high bluffs at a bend of the river; and among noteworthy features are the Musser Library (public), a soldiers' monument, a public park, two hospitals, and a high bridge across the river. The city carries on considerable trade in lumber and agricultural produce, being known especially for the watermelons and sweet potatoes grown on Muscatine Island, just below the city. It is an important industrial centre, its establishments including canning factories, pickle works, found-

ries and machine shops, sheet-iron, boiler, and engine works, manufactories of various lumber products, potteries, button factories, box and packing-case factories, brick and tile works, carriage and wagon shops, etc. Settled in 1833, Muscatine was incorporated first in 1839. The government, under a charter of 1851, subsequently amended by State special charter laws, is vested in a mayor, elected every two years, and a unicameral council, which controls important powers of confirmation and election in administrative offices. The police judge, treasurer, wharf master, assessor, and school board are chosen by popular vote. The city owns and operates the water works. Pop., 1890, 11,454; 1900, 14,073; 1910, 16,178; 1914 (U. S. est.), 17,074. Consult I. B. Richman (ed.), *History of Muscatine County* (2 vols., Chicago, 1911).

MUSCHELKALK, *mush'el-kalk* (Ger., shell lime). The middle member of the Triassic or New Red Sandstone period in continental Europe. In Germany the formation consists chiefly of limestones, which abound in the remains of mollusca; hence the name muschelkalk. The beds are of much economic importance, containing salt, marl, and gypsum.

MUSCI, *müs'si* (Lat., mosses). The technical name of the group of plants known as mosses, one of the two subdivisions of bryophytes, the other being the Hepaticæ (liverworts). Mosses are adapted to all conditions, from submerged to very dry, and are most abundantly displayed

there is first developed a small, green, thread-body (protonema), upon which appear buds that give rise to the ordinary leafy moss plant. Upon this leafy plant the sex organs (antheridia and archegonia) are borne (Fig. 1), and hence it is the sexual phase (gametophyte) in the

FIG 2 1, gametophyte, showing original spore (y) protonema (p), buds (b) which develop the leafy branch (s) 2, a young sporophyte (c) emerging from the leafy plant (s)

alternating generations. The sex organs produce a fertilized egg, which upon germination does not reproduce a leafy moss plant but a structure of totally different character, viz., a stalked spore case (sporogonium), full of asexual spores, commonly called the moss "fruit." Since this sporogonium has no sex organs, it is the sexless phase (sporophyte) in

FIG. 1 The so-called flower of a moss in longitudinal section, showing antheridia (a), archegonia (b), and paraphyses (p). Outside all are longitudinal sections of leaves

in temperate and Arctic regions. They have great power of vegetative multiplication, new leafy shoots putting out from old ones, thus forming thick carpets and cushions. Bog mosses often completely fill up bogs or small ponds and lakes with a dense growth which dies below and continues to grow above. These quaking bogs or mosses furnish very treacherous footing. In their depths the dead moss plants become slowly modified into peat.

There are two great groups of mosses, the *Sphagnum* forms (peat or bog mosses) and *Bryum* forms (true mosses). The life history of a true moss shows a distinct alternation of generations (q.v.). When a spore germinates,

FIG 3 1, the young sporophyte (c) rupturing the bladder-like archegonium and carrying up the upper portion (c), as a hood (calyptra) 2, mature sporophyte (sporogonium), showing foot (f), seta (y), capsule (c), and operculum (o). Both diagrammatic.

the alternation. When these spores germinate they produce leafy moss plants (gametophytes) again, and so alternation continues. (See Fig 2.) The spore case (capsule) of an ordinary

moss, generally pendent from a slender stalk (seta), is a very complicated structure. It is usually somewhat urn-shaped, with a little conical or flattish lid (operculum), which is thrown off when the spores are to be discharged. Often also the mouth of the urn is guarded by beautiful hairlike or toothlike structures which converge towards the centre and are collectively known as the peristome (around the mouth). Through the centre of the capsule there runs an axis of sterile tissue, called the columella, while capping the top of the capsule like a loose hood is the calyptra, which is the dead and ruptured female sex organ (archegonium) that has been carried up by the elongating sporogonium (Fig 3). Consult A. J. Grout, *Mosses with a Hand-Lens* (2d ed., New York, 1905), and E. H. Hille, *Flowerless Plants* (1b, 1909). See BRYOPHYTES.

MUSCIDÆ (Neo-Lat. nom. pl. from Lat. *musca*, fly). A family of dipterous insects comprising the typical or true flies. The bristle of the antennæ is feathery, and the abdomen is smooth except for a certain number of bristles near the tip. The larvæ as a rule feed upon decaying animal or vegetable matter, more abundantly upon the former. The group comprises many species and includes some of the most common and abundant forms, such as the house fly, the horn fly, and the stable fly (qqv).

MUSCLE, DISEASES OF. Inflammation of muscle tissue is called myositis (Gk. *mûs*, *μῦς*, *mûs*, *mys*, *myos*, muscle + *itis*). It may be acute or chronic. The acute form may be due to infection or injury and sometimes terminates in suppuration. There are slight tenderness, swelling, and œdema. In trichinosis the muscles are inflamed and tender from the presence of a minute worm, the trichina. A chronic form of the disease, known as myositis ossificans, is a progressive affection, either congenital or beginning in infancy, and confined almost exclusively to the male sex. The affection is characterized by the gradual formation in the muscles, generally of the back, of masses of bone tissue, pronounced deformity results, the respiration becomes impeded, and death occurs in about 10 years. The pathology is obscure, and no curative treatment is known. A similar condition may develop after severe injury, but in this form the ultimate prognosis is good.

The voluntary muscles may become atrophied from want of use, from long-continued pressure, from injury, from interference of the blood supply, or disease of their supplying nerves or their centres in the spinal cord, as is often seen in lead poisoning or infantile spinal paralysis (See POLIOMYELITIS). Muscles may become contracted from disease or injury or may be dislocated as a result of accident. The long head of the biceps is most frequently displaced. Diseases of the joints, such as rheumatoid arthritis of the shoulder, may also bring this about. Other conditions which may be occasioned by injury are wounds and contusions, hernia, rupture, and strain, the latter term applying to a condition in which the muscle is unduly stretched and some of its fibres broken. Muscles may become hypertrophied by excessive use. In pseudohypertrophic paralysis the bulk of the muscle is apparently increased, but in reality there is less muscle structure than normal, the increase consisting of fat and connective tissue.

Gradual wasting of the muscles is observed in many nervous diseases. A specific form,

progressive muscular atrophy, known also as wasting palsy, chronic anterior poliomyelitis, and Duchenne-Aran's disease, occurs in males between 25 and 50 years of age and in many instances is believed to be hereditary. Several etiological theories are put forward, but the ultimate causation of the disease is obscure.

The term "dystrophy" is applied to conditions of progressive muscular weakness with atrophy, in which the seat of the lesion is in the muscle itself rather than in the spinal cord or nerve fibres. Many types of progressive muscular dystrophy have been described, among which may be mentioned Erb's paralysis and Landouzy-Déjérine's paralysis, the one beginning in childhood, the other in infancy. Pseudohypertrophic paralysis is sometimes classed as a dystrophy.

MUSCLE and **MUSCULAR TISSUE** (Lat. *musculus*). While contractility is a property of

all active, living protoplasm, it is in muscular tissue that this property reaches its highest development, the ability to contract along certain definite lines being the peculiar function of this tissue. Muscle tissue occurs in three different forms. 1. *Striated Voluntary Muscle*.—This form is found in all those muscles which are under the control of the will, in fact all those which in the common use of the term are called

INVOLUNTARY MUSCLE IN LONGITUDINAL SECTION.

muscles, such, e.g., as the biceps, triceps, etc.

2. *Nonstriated Involuntary Muscle*.—This form occurs in the muscles which are not under the control of the will, but which carry on the automatic functions of life, such as the muscles of the intestine, which control its peristaltic action, or the muscles of the arteries and veins, which govern their contractility. 3. *Striated Involuntary Muscle or Cardiac Muscle*.—This form is peculiar to the heart, and appears to occupy an intermediate position between the other forms of muscular tissue.

INVOLUNTARY MUSCLE IN TRANSVERSE SECTION
Art. t., areolar tissue

1. *Striated Voluntary Muscle*.—This constitutes the ordinary voluntary muscles of the skeletal system, and occurs in the pharynx,

larynx, diaphragm, generative organs, etc. It is composed of long cylindrical fibres, each one of which represents a highly specialized develop-

VOLUNTARY MUSCLE IN TRANSVERSE SECTION
m.f., muscle fibres, end., endomysium, per., perimysium

ment of a single cell. The muscle fibre consists of the muscle substance proper, the muscle nuclei, and an external sheath or sarcolemma. The muscle substance of a fibre shows a longitudinal striation which indicates its division into ultimate fibrillæ, while transversely it consists of alternate light and dark bands or disks. The light disk is crossed by a delicate dark line, the line or membrane

of Krause. A light line across the dark disk (Hensen's line) has also been described, but is probably an artifact. The minute bit of muscular tissue separated off by Krause's line at either end and by the dividing line between the fibrillæ on each side is known as the sarcous element of Bowman, while the appearance presented by the crosscut ends of the fibrillæ composing a single fibre is called Cohnheim's field. Each fibre is inclosed in a transparent, very delicate, but tough and elastic sheath, known as the sarcolemma or myolemma, the former term being derived from the Greek words *sarx* (flesh) and *lemma* (skin or husk), the latter from the Greek words *mus* (muscle) and *lemma*. Just beneath the sarcolemma, in the protoplasm, lie the muscle nuclei. They are oval or spindle-shaped, their long axes

corresponding to those of the fibre. The individual fibres are held together by a delicate connective tissue called the endomysium, they are bound together into bundles or fascicles by a coarser connective tissue, the perimysium, while the entire muscle is surrounded by a connective tissue sheath, the epimysium. In short muscles single fibres may extend the entire length of the muscle. In longer muscles individual fibres do not extend the entire length of the muscle, averaging 25 to 50 millimeters in length. Very long fibres, 100 to 120 millimeters long, are sometimes found. The fibres taper somewhat at their ends and terminate, if in the middle of the muscle, by a blending of the sarcolemma with the endomysium of the neighboring fibres; if in tendon, periosteum, or perichondrium, by union of the sarcolemma with the connective tissue. Striated muscle is extremely vascular. The larger vessels run in the perimysium, where they branch, and these smaller branches give off capillaries which form

a rectangular network among the individual fibres. The larger nerve trunks run in the perimysium, where they subdivide and send

branches to the muscle fibres. Here they terminate in special end plates. See NERVOUS SYSTEM.

2 Nonstriated Involuntary Muscle—This form of muscular tissue, while not occurring in large masses, has an extremely wide distribution. It forms the muscularis mucosæ and muscular coats of the gastrointestinal canal, the

INVOLUNTARY MUSCLE
Smooth muscle fibres from the small intestine of a frog.

muscular walls of the arteries and veins, of the trachea and bronchi, of the larger ducts of glands, and occurs in the urinary tract and in the male and female generative organs. It consists of long, slender, spindle-shaped cells from 0.75 to 2.30 millimeter in length and from 0.04 to 0.10 millimeter in thickness. Its substance shows fine longitudinal markings. A delicate sheath or cell wall has been described and within this is the semifluid granular protoplasm

of the cell body. In the centre of the latter lies a long rod-shaped nucleus towards each end of which a few fine granules are found. These cells are arranged in bundles, the individual cells being held together by a cement substance, the bundles being surrounded by connective tissue. Blood vessels ramify in this connective tissue, where they break up into capillaries which form a network among the muscle cells. Nerves, mainly of the sympathetic system, pass to the individual muscle cells.

3 Striated Involuntary Muscle (Cardiac or Heart Muscle)—This is a type of muscular tissue peculiar to the heart. It resembles the smooth involuntary muscle in being composed of nucleated cells. These cells are, however, much larger and broader than the smooth muscle cells, are more or less rectangular in shape, and send off lateral branches which join similar branches of neighboring cells, with which they are connected by cement substance. The cell

nuc., nuclei, t.m.s., termination of muscular substance

protoplasm shows both longitudinal and transverse striations, but much less marked than in striated voluntary muscle. A cross section of

HEART MUSCLE

a cell gives somewhat the appearance of Cohnheim's field, but the fibrillæ show a more or less radial arrangement about the circumference. The nucleus is round or slightly oval in shape and is situated near the centre of the cell

Development. Muscle is developed from the mesoderm or middle layer of the embryo. Smooth muscle cells are produced by a differentiation of mesodermal cells. Voluntary striated muscle is developed by a still further specialization of these mesodermal cells, the nuclei proliferating and longitudinal and transverse striations appearing in the protoplasm. In this way the cells become gradually transformed into the fibres of voluntary muscle. Heart muscle has the same derivation, and represents an intermediate stage of development between the more primitive smooth muscle cells and the more highly specialized striated muscle fibres. For diseases, see **MUSCLE, DISEASES OF.**

MUSCLE READING. The intuition of a person's thought by physical contact. Every complete mental process tends to issue or express itself in movement; the psychophysical organism is essentially a motor organism. In many cases these expressive or concomitant movements are involuntary and unknown to their performer. It is often possible, by close attention to them, to get an inkling of the object or direction of the agent's thought. Some persons, indeed, have a peculiar aptitude for this muscle reading, or (as it has been wrongly termed) mind reading, so that they are able, by taking into account all the objective indications presented by the agent, to reproduce in somewhat surprising detail the course of his thought.

Muscle reading was much in vogue a few years since as a drawing-room game. On the stage it is customary for the mind reader to lay the hand of the subject upon his forehead or to take the subject's hand in his own. By minute observation of the subject's involuntary movements, of his tremor or flush of excitement, etc., it is possible for the reader to guess, in many instances, the number of a watch, the place and character of a hidden object, etc., the subject being completely unaware that he is giving any suggestion, and the suggestions themselves being unnoticeable to the audience. With the most successful mind readers the process of observation has itself become habitual and therefore partly unconscious, so that they are unable to explain their *modus operandi*, even if they desire to do so. Their extreme fatigue, at the conclusion of a performance, indicates, however, that attention has been under great strain.

This appreciation of unconscious movements and of vasomotor changes in the subject is sufficient to explain all the feats of mind reading that are on record, surprising as some of them may appear. Consult Preyer, *Die Erklärung des Gedankenlesens* (Leipzig, 1886), and Joseph Jastrow, *Fact and Fable in Psychology* (Boston, 1900).

MUSCLE SENSE. Historically, a sixth

sense, supposed to furnish in connection with the movement of voluntary muscle a specific quality, directly concerned in the perception of position and movement of the bodily frame and less directly in the perception of space at large. Experimental psychology has shown, however, that special sense qualities arise not only from the muscles but also from the tendons and from the structures about the joints, and that movements of the head or of the body as a whole give rise to still other qualities, those of the static sense (q.v.). To all these qualities taken together the term "kinæsthetic sensations" is at present applied, and the term "muscle sense," except in an historical context, has tended to fall into disuse.

In consequence of the inaccessibility of the end organs and of their spatial contiguity with one another and with the cutaneous endings, kinæsthetic sensations cannot easily be isolated for study. They seem, furthermore, to possess a textural similarity to one another and to cutaneous pressure, and a tendency to fuse readily together into complexes, so that their individual recognition is especially difficult. If, however, the position of the arm be kept constant, so that there is no change of articular conditions; if the skin and subcutaneous tissue be anesthetized by ether or by a cocaine injection; and if the body of the muscle be then pressed, or stimulated by an electric current, the specific sensation of voluntary muscle may be experienced. With moderate intensities of stimulus the sensation is a dull, dead, diffuse pressure, most nearly akin to pressure sensations obtained by pressing a blunt object lightly upon the normal skin, with stronger intensities the sensation has a dragging or grinding character, presently becomes sore and achy, and finally merges into dull pain. The sensation with these higher degrees of intensity seems to be the characteristic part of the feeling of fatigue.

Less complete isolation is possible in the case of tendinous and articular sensations. Articular sensations may be approximated if we bend the hand with relaxed fingers slowly and evenly about the wrist, ruling out or abstracting so far as possible from the cutaneous sensations and attending to the sensation complex localized within the wrist joint. Under these conditions the complex is distinguishable from the dull, dead muscular quality. The impression is very like that obtained by turning a soapy finger within the loosely shut other hand, i.e., is like cutaneous pressure over a considerable area. Analysis of a number of other experiences, such as those of severe muscular work, of supporting or lifting a heavy weight, of tightly clenching the fist, or even of expectant attention, brings to light a third quality which we term effort or strain. The sensation seems to have its origin in the tendon. It is more lively, thinner, more definite and cleaner-cut than muscular pressure; it is also distinguishable from cutaneous and articular sensation. Like the dragging sensation of the muscles, it takes on the character of dull pain with higher intensities of stimulus.

The assignment of nervous end organs to the above-mentioned qualities must remain at present a matter of probability rather than of certainty. Medullated fibres ending in the substance of the muscles take on differentiated forms known as the muscle spindles. The ten-

dons contain similar structures, known as the spindles of Golgi. Pacinian corpuscles and histologically related bodies are widely distributed. They are especially plentiful in muscle and tendon fascia and in the synovial membrane and ligaments of the joints, they are also found in adipose tissue, in the periosteum, in the body of the tendons and muscles, in the walls of blood vessels, and elsewhere. Sensory nerve endings occur, further, in the substance of the bony tissue. Considerable evidence exists for assigning the dragging and aching sensations of the muscle to the muscle spindles, and the sensation of strain to the spindles of Golgi. The Pacinian corpuscles appear to be connected with articular pressure. If they are differently tuned, as the pressure and temperature organs of the skin appear to be, it seems probable that when intensely stimulated they may also be responsible for dull muscular pressure.

As already mentioned, kinæsthetic sensations do not ordinarily appear alone, but fuse with one another and with other sensations in the form of perceptions; and they appear to be especially prominent in the perception of bodily movement. The relative importance in this perception of the various qualities mentioned, however, is at present a matter of some dispute. On general principles it seems hardly possible that muscular and tendinous sensations can play the leading part, simply because movements of equal range and like direction are constantly made with very different conditions in these parts,—with the limb flexed or extended, free or heavily weighted,—so that variations in the intensity of the sensations there aroused can hardly serve as unambiguous cues. Experimental and pathological variations seemed also, at first, to argue for the undivided importance of articular sensations. If articular sensitivity was impaired, the perception of movement was blunted, and if with impaired sensitivity articular stimulation was increased in intensity, the perception was sharpened, whereas muscular and tendinous sensations might, apparently, be ruled out without decreasing the accuracy of perception. More recent experiments, however, appear to indicate that, at least under normal conditions, the other kinæsthetic qualities and cutaneous sensations may furnish subsidiary cues whose absence results in decreased accuracy of perception. With the normal forearm laid passively on a board hinged beneath the elbow, e.g., it is found that we are able with closed eyes to appreciate a gentle movement of the arm through an arc of as little as $\frac{1}{100}$ of a degree. If the skin is anesthetized, however, the movement must be about a hundred times as great in order to be perceived. In general, experiment tends to show that external pressures upon the skin and distentions and other movements of the skin brought about by movements of the subcutaneous tissues are normally of great importance in our estimation of the rate, range, and direction of movement. It appears, furthermore, in experiments with the elbow board, that a faradizing current passing through the wrist, and apparently anesthetizing the sensory endings in the muscles and tendons there attached, may be as effective in impairing the accuracy of perception of movement about the elbow as a current passed through the elbow joint itself. Still other experiments upon active movement, upon the after image of movement, and upon movement illusions in the limbs, tend

to show that patterns of muscular and tendinous sensations may sometimes become important in this perception.

Kinæsthetic sensations are also the basis and the prominent qualities of other perceptions, such as those of weight and resistance, and, although not necessarily prominent, they are essentially concerned in the perceptions of space and of the movements of objects, in the perceptions of rhythm and time, and even in such apparently simple qualities as hunger and nausea. (See these titles.) As a matter of fact, experience at large seems in great measure to derive its meaning (q.v.) through their concernment.

MUSCLE SENSE IN ANIMALS. See KINÆSTHETIC SENSATIONS IN ANIMALS.

MUSCOGEE. See MUSKOGEE.

MUSCOGEE INDIANS. See CREEKS.

MUSCOVITE. A very common mineral of the mica group, which is in composition a hydrous potassium-aluminum silicate and which crystallizes in forms of the monoclinic system. Its usual color ranges from gray to brown, but it also occurs in different shades of green, violet, yellow, and sometimes rose red. It has a vitreous lustre that is more or less pearly or silky, and its specific gravity is from 2.76 to 3. Muscovite is one of the essential constituents of granite, gneiss, mica schist, and certain other rocks. It is widely distributed in nature, occurring most abundantly in Tirol, Styria, on the St. Gotthard, and elsewhere in Switzerland, as well as at Paris, Me, Grafton, N. H., Chesterfield, Mass., and numerous localities of North Carolina, in the United States. The fact that it has a cleavage parallel to the base, and is easily separated, forming thin elastic plates which are transparent to translucent, led to its use as the material for window panes in Russia, whence its name of *Muscovy glass*, and to its extensive and similar use in stoves under the misleading name of *isinglass*. It is also employed commercially in wall paper, as a filler, in electrical machines as an insulator, and to a certain extent as a paint. See MICA.

MUSCOVY. A name formerly applied to Russia, whose capital down to the beginning of the eighteenth century was Moscow.

MUSCOVY DUCK (corrupted from *musk duck*). A large South American duck (*Cairina moschata*) in which the male is much larger than the female and has fleshy wattles on the forehead and lores and a crest of long feathers. This duck has long been domesticated in Brazil and in Europe, where it is especially in favor in Germany. In the United States they are less esteemed, because of their quarrelsome nature and ability to harm one another or their companions in the poultry yard. Two varieties are recognized, colored and white, which are thus described in Howard's *Farmers' Bulletin*, No. 64, of the United States Department of Agriculture (Washington, 1897). The head of the colored muscovy is glossy black and white; the bill is

dark horn in color; eyes, brown; the back in color of plumage is lustrous blue black, which is sometimes broken with white. The color of the breast and body is the same as that of the back. The wing coverts are rich, lustrous green black, and the tail feathers may be either black or white, the latter being preferred. The thighs, like the tail feathers, may be either black or white, white being preferred; the shanks, toes, and webs vary in color from yellow to dark lead or black. The white muscovy in color of plumage is pure white throughout, feathers of any other color will disqualify the bird for show purposes. The eyes in the white variety are of a leaden-blue or gray color, while those of the colored are brown. The shanks, toes, and webs are of a pale-orange or yellow color. The standard weight of the adult drake is 10 pounds; adult duck, 8 pounds. The flesh is good and loses in cooking the musky odor of the living bird. See DUCK.

MUSCULAR FORCE, ORIGIN OF. This subject has occupied the attention of physiologists for many years, and numerous theories have been offered to explain the phenomena of muscular energy. The older observers, represented by Liebig, held that nitrogenous food went to build up and maintain muscular tissue and that energy was evolved in the oxidation of this class of food, the waste being represented in the excreted urea. The nonnitrogenous foods (carbohydrates and fats) were supposed to be entirely devoted to the production of heat. Muscular work should therefore cause a distinct increase in the elimination of urea. But this theory is invalidated by the fact that the excretion of urea does not keep pace with the production of energy. Later observers have taken the opposite view, that force is generated by the oxidation of nonnitrogenous substances, and that the nitrogen constituents of muscle are rather to be looked upon as forming a part of the machine in which the former substances are burned than as constituting the fuel themselves.

Herman holds that muscular activity depends upon the splitting up and subsequent reformation of a complex nitrogenous body which he calls *inogen*. From the decomposition of this body there result carbon dioxide, sarcolactic acid, and a gelatino-albuminous body. Of these the carbon dioxide is carried away by the blood, and the acid and the albuminous substance, at least in part, go to rebuild the *inogen*. The other materials of which the *inogen* is formed are supplied by the blood. Of these materials oxygen and some carbohydrate substance form a part. The decomposition takes place both in resting and active muscle, but is much greater in the latter. This theory explains certain known facts of muscular metabolism: that muscle absorbs oxygen and gives off carbon dioxide during both rest and activity, and that increased exchange of these gases takes place during the latter condition; that this process is attended by the production of heat; and that muscle during rest produces nitrogenous crystallizable substances such as creatine from the metabolism going on constantly during life.

Greene thus sums up what is at present really known as to chemical changes in contracting muscle: 1. The alkaline muscle becomes acid from the presence of sarcolactic acid. 2. The muscle gives out carbon dioxide and takes up oxygen, but the amount of the carbon dioxide

given out is not entirely dependent upon the oxygen taken in, and must arise partly from some other source. 3. Certain imperfectly understood chemical changes occur, probably connected with the foregoing phenomena, in which glycogen is converted into dextrose and the latter oxidized.

For a full discussion of this subject, see Michael Foster, *Textbook of Physiology* (new ed., New York, 1904), and W. S. Kirke, *Handbook of Physiology*, revised by C. W. Greene (8th ed., 1b, 1914). See also PHYSIOLOGY.

MUSCULAR RHEUMATISM. See RHEUMATISM, MUSCULAR.

MUSCULAR SYSTEM, EVOLUTION OF. The muscular system comprises those tissues or masses of tissue which have the property of contractility and whose function it is to accomplish the movements of the parts or of the whole of the animal body. Contractility is one of the properties of simple protoplasm. Thus, the *amœba* progresses by the extension of some portion and the contraction of other parts of its body. The cortical layer of *Paramœcium* is a specially contractile region in the protoplasm. In the *Stentor* and the stalk of *Vorticella* there are protoplasmic differentiations that resemble muscle fibres.

Many of the outer-living ectoderm cells of *Hydra* show considerable differentiation; they are conical in shape, with the broad surface outward. On this external surface a thin, cuticle-like layer has been demonstrated. Internally the cell ends in a contractile basal portion or process which lies parallel to the long axis of the body of the hydra and between the ectoderm and endoderm. The whole of these cells are contractile, but the long processes are specially so. These processes were formerly known as neuromuscular, but with the discovery of special nerve cells the muscular function alone must be conceded to them. Like the muscle cells of vertebrates they contract when properly stimulated. Here, then, are ectodermic muscle cells, the entire protoplasm of which, like that of the *amœba*, is irritable and contractile, but with a portion of the cell more clearly set apart to perform the contractile function than in any protozoan. In the jellyfishes, such as *Aurelia*, a muscle cell is likewise composed of two parts—a contractile portion (which shows cross striations) and, attached to the striated portion, a protoplasmic, nondifferentiated, noncontractile portion which may bear cilia on its external surface. This muscle-bearing epithelium is arranged in a bundle or ring around the edge of the subumbrella. It is the contraction of this muscular zone that propels the jellyfish through the water. In the tentacles and about the lips unstriated muscle fibres occur. The contraction and extension of the body of the sea anemone, as well as of its gullet and mesenteries, and its ability to move slowly from the point of attachment, are accomplished by means of a well-developed muscular system. This consists of bands of longitudinal muscle fibres which run on the mesenteries from the base to the disk; of parietal muscles which pass obliquely across the lower and outer angle of the mesentery, and of a thin sheet of transverse muscles. The contraction of the longitudinal muscles draws the animal towards the base, and that of the transverse muscles causes the contracted animal to extend again. A band of circular muscles at the junction of column and disk causes the disk

and contracted tentacles to be inclosed within the body of the anemone. In addition to the bands of muscles, scattered fibres occur both in the body wall and in the gullet, which consist partly of spindle-shaped, nucleated fibres and partly of such striated muscle processes as occur in *Hydra*. The latter are mostly found in the transverse muscles of the body and the tentacles, and are of entodermal origin, as also are the muscle bands of the mesenteries. Other longitudinal muscles are of ectodermic origin. Some of the muscles, however, sink so far down into the middle layer or mesoglea as to seem to belong to it alone. This is significant because all the musculature of animals above the ctenenterates lies between the ectoderm and entoderm.

The musculature of flatworms falls under two groups: (1) the dermal musculature and (2) the dorsoventral musculature. The dermal musculature lies either under the basal membrane of the epidermis or under the cuticle. It is composed of distinct layers. In each layer all the fibres run in one and the same direction. There are longitudinal muscles, transverse and diagonal muscles. The musculature is stronger on the ventral creeping surface. In cestodes the diagonal layer is replaced by a second circular layer. The dorsoventral musculature runs from the dorsal to the ventral surface, and is much displaced at sexual maturity by the male and female germ glands. Below the cuticular layer of roundworms there is a well-developed muscular layer in the form of a tube, and composed of outer circular fibres and inner longitudinal ones. This muscular tube effects the writhings and undulations of the body. As in the ctenenterates, the muscle element is composed of a single cell, made up of a protoplasmic (often glandular) portion and a fibrillar part. The fibrillæ rarely show any evidence of cross striation, the lateral lines are free from muscle fibres, and the longitudinal sheet is thus broken up into bands.

The muscular system of mollusks is also well developed. The muscle fibres, both of bivalves and gastropods, are all of the unstriated sort, because of the slow movements of the animals. These fibres occur usually in distinct bands or sheets, and frequently are combined for greater power to form very large muscles, such as the two abductors of *iodonta*, which close the shell. Other important muscles are those of the foot, including two protractors and one retractor, and in the snail those that work the radula of the mouth, the retractors of the horns and penis, and those that pull the head into the shell. The muscles are fastened to the shell, upon which they make certain distinct markings at the points of attachment, called scars.

The musculature of segmented worms, like that of the roundworms, is composed of a dermomusculature tube which is composed of an outer circular and an inner longitudinal layer of fibres. The fibres are in the form of bands. The pharynx, mouth, gut, parapodia, and septæ have special muscle fibres. In leeches, in addition to the circular and longitudinal bands of muscle fibres, there are bands reaching diagonally from the dorsal to the ventral surface of the body.

Among arthropods the musculature of the Crustacea is well developed and very complex, but there is little evidence remaining of the dermomuscular tube of worms. It is assumed that the dorsal and ventral pair of longitudinal muscles correspond to the four similarly situated

bands of muscle in the Polychæta. Perhaps traces of the circular musculature of annelids are found in the muscles that are attached to the basal parts of the appendages on the one hand and to the integument of the body on the other. Certainly the firmer exoskeleton makes greater localization of the musculature possible. In the limb-bearing portion of the abdomen and the thorax there are paired dorsal and ventral muscle bands. In the limbless part of the abdomen there is a thick layer or tube of longitudinal muscle fibres, interrupted at each septum by the connective tissue that separates the myomeres. Thus the muscle itself is separated into myomeres. The abdomen is bent upward, downward, or sideways by the contraction of the muscle fibres in the corresponding portion of the body. The appendages are moved by muscles that pass out into them from the trunk. The muscles are either attached to the cuticular outer covering or to inward projecting parts of it, and often terminate in sinewy pieces that are white and are composed of bundles of cross-striated fibres—the kind of fibre that characterizes all rapidly moving muscle. In *Peripatus*, however, the muscles are unstriated, save those which work the jaws. In insects, the thorax and metathorax, as in the case of the grasshopper, are crowded with leg and wing muscles. In the cockroach, where the wings are little used, the wing muscles are poorly developed.

The musculature of *Amphioxus*, like that of the abdomen of Crustacea, is divided into metameres. Of these muscular segments or myomeres there are about sixty, V-shaped on surface view, with the apex of the V extending forward. The myomeres are composed of striated muscle fibres which extend longitudinally and are attached to the septa immediately in front and behind them. The myomeres of the two sides alternate. The musculature of the dorsal wall is the thicker.

In cyclostomes, as well as in *Amphioxus*, the muscles of any myomere are attached to the anterior and posterior myocomata of that segment. In selachians a significant change has occurred—the first step towards the complicated conditions of higher vertebrates. Certain of the ventral lateral muscles on either side of the median line become differentiated from the others, in that their fibres move out from the general level in correspondence with their greater functional activity. Thus, while the dorsal trunk muscles retain their primitive character, the ventral muscles have become separated into two masses: a pair of strong mid-ventral ones which are known together as the rectus abdominis, and the remaining muscular mass. We next find that in this latter mass the direction of the muscle fibres, which in *Amphioxus* and cyclostomes is horizontal, has become in selachians oblique, so that, from the mid-ventral line, they pass dorsoposteriorly. The remaining less differentiated portion of the ventral musculature is known as obliquus abdominis, or oblique abdominal muscle. Two kinds of changes have now occurred in the vertebrate musculature: (1) There is the functional differentiation of parts of muscles by which they become cut off from the remainder, and (2) changes in the direction of muscle fibres by which originally axial muscles have become oblique. In the lowest vertebrates the anterior and posterior ends of muscles are attached to the adjacent myocomata.

With the development of ribs from the fibrous tissue of the myocommata, muscular attachment has, in part, fallen upon them. The derma, indeed, is differentiated from the same tissue as the myocommata, hence it is not surprising that, in the migrations on the ends of muscles to adapt themselves to the new conditions, we find that some muscles are attached to the derma. Finally, some muscles, whose ends come thus to lie outside of the myomeres, may extend alongside of several somites without signs of metamerism. Thus, by these simple modifications, we gain the complex musculature of the higher vertebrates, where there are trunk muscles of different sizes and lengths, often without metamerism and attached to bony parts such as ribs, or to the skin. In *Amphioxus* the myomeres are arranged with reference to the sagittal plane from which they extend obliquely outward and backward. In cyclostomes the obliquity is so great that the myomeres overlap each other like the shingles on a roof, so that a cross section of the body may cut three or four myocommata on each side. In many fishes the free edge of the myocommata, as it appears at the surface, is not merely bowed, but is zigzag.

The most typical condition of the amphibian musculature is shown in Urodela. The dorsal lateral muscles retain most nearly the fishlike condition and lie in metameres. When the ribs and transverse processes of the vertebrae become developed some of the muscles gain attachment to them, and thus give rise to the intercostal and intertransversal muscles. The ventral lateral muscles of fishes are disposed in two regions. In Amphibia they comprise four regions, derived from a migration and splitting of the two lateral muscles of fishes. In addition, lying under the internal oblique, there is a muscle that probably has no representative in fishes. It is unsegmented and lies deeper than the skeleton and immediately within the peritoneal lining of the body cavity. The Anura differ from the Urodela chiefly in the absence of the transversal abdominis, and in the diminution or disappearance of myocommata in the adult.

In reptiles, as in Amphibia, the dorsal musculature retains more nearly the primitive condition. With the ossification of the skeletogenous tissue and the consequent attachment of the muscles to the bone, has come about the differentiation of the so-called interspinales, semispinales, intertransversals, longissimus dorsi, and others. The last-named muscle is to be regarded as a part of the dorsal musculature that has lost its metamerism, and now passes from the pelvic girdle to several of the spines of the thoracic vertebrae. The ventral musculature has become still more complicated, owing, according to Wiedersheim, to the changed rhythmic method of respiration, controlled through the more and more greatly developed lungs. To meet the needs of respiration the ribs must be moved. The muscles which perform this function have become more powerful in that the ribs have become buried in them. The musculature of successive myomeres, which projects outside or inside the ribs, becomes united into a single sheet. With the disappearance of the ribs in the lumbar region of reptiles a modification of the intercostals must of course take place. A continuous muscle is developed between the last rib and the pelvis.

The phylogeny of many of the muscles of mam-

mals is not known. The more important muscles resemble those of reptiles.

Two kinds of muscular fibres are found in the vertebrate body. All the quickly moving voluntary muscles are composed of striated fibres. The involuntary muscles are unstriated. The muscle fibre of vertebrate muscle, like that of invertebrates, is formed by the differentiation of a muscle cell. Only in the muscle cell of the lower invertebrates a much smaller portion of the cell is transformed into fibre structure than is the case in vertebrate muscle fibre. The differentiated portion of vertebrate muscle fibre is composed of fibrillae and forms the main bulk of the cell. The fibrillae are embedded in the undifferentiated part, which also surrounds them in the form of a sheath and contains the nuclei.

MUSCULUS, WOLFGANG (properly **MÜSLIN**) (1497-1563). A German reformer and theologian, born at Dieuze in Lorraine. At 15 he entered a Benedictine cloister at Lixheim, but left in 1527, having been turned to Protestantism by Luther's writings. In 1531 he became pastor at Augsburg, and for seventeen years was prominent in that city. Musculus was long an eager partisan of union between the Lutheran and Reformed churches and took part in the Wittenberg Agreement (1536), and in the colloquies of Worms and Ratisbon (1540-41). At the time of the Augsburg Interim (1548) he went to Switzerland, and in 1549 became professor of theology at Bern. His views were more strongly Calvinistic in his later years, and with Calvin and Vermigli he may be reckoned as a leader of the sixteenth-century Reformation. Consult Grote, *W. Musculus* (Hamburg, 1855).

MUSÉE, mu'zâ' (Fr., museum). The first part of the names of a number of museums in Paris, of which the most important are 1. **MUSÉE CARNAVALET**, devoted to Parisian history and archæology, occupying a mansion on the Rue des Francs-Bourgeois formerly known as the Hôtel de Ligneris, begun in 1544 by P. Lescot (q.v.) and extended 1660 by N. F. Mansart (q.v.) with two fine courts, and sculptures by Jean Goujon. 2. **MUSÉE DE CLUNY** (see **CLUNY, HÔTEL DE**). 3. **MUSÉE GALLIÈRA**, devoted to municipal art and temporary exhibitions, a handsome modern building and court by Ginain (1888) on the Rue Pierre Charron. 4. **MUSÉE GUIMET**, a museum of Oriental art and religions, on the Place d'Iéna, founded by the late Emile Guimet of Lyons. 5. **MUSÉE DU LOUVRE** (see **LOUVRE**). 6. **MUSÉE DU TROCADÉRO** or **Musée de Sculpture Comparée**, a vast collection of casts of historic masterpieces of sculpture in the wings of the Trocadéro (q.v.) Palace.

MUSÉE SOCIAL, sô'syâl' (Fr., social museum), **THE**. An organization whose object is to furnish the public with information regarding movements having for their aim the improvement of the moral and material situation of the laboring classes. It resulted from the interest in the social science exhibition at the Paris Exposition of 1889, but was not formally

inaugurated until March 25, 1895. The Comte de Chambrun gave the institution an endowment of over 2,000,000 francs. Special collections of all matters pertaining to labor, trade-unions, old-age pensions, housing reform, etc., are made and indexed for ready reference. Studies of labor conditions in various countries have been undertaken, and the results published in monographs. Although young, the Musée has proved of great usefulness. It was very active in preparing the excellent exhibit of social economy in the Exposition of 1900. The more important publications of the Musée are contained in the *Bibliothèque du Musée Social*. It issues a small monthly "circular" containing general matter pertaining to labor.

MUSES (Lat. *Musa*, Gk. *Μοῦσα*, *Mousa*). In Greek mythology, the inspirers of song and music. In the Homeric epic their personality and number are vague, the poet now invoking but one Muse, now a number, only in a very late passage in the *Odyssey* are nine mentioned. In Homer, again, they are divine singers, dwelling on Olympus, and singing at the heavenly banquets, since they see and remember all things, they can inspire the bard. In the *Theogony* of Hesiod, 77 ff, the canonical number, nine, and the separate names appear. Originally probably nymphs of fountains on Mount Olympus, they seem to have been worshiped first in Pieria, whence the cult spread southward and established itself on Mount Helicon at Ascra, and in Thespie. We hear of shrines also at Delphi and at Athens, both on the Ilissus and on the Museum Hill, which thus obtained its name. They always loved fountains, e.g., Castalia, Aganippe, Hippocrene. There are grounds for believing that, like the Charites and the Horæ, the Muses were originally three, but nine was their number on Helicon, and this became universally accepted, as well as the tradition that they were the daughters of Zeus and Mnemosyne (Memory). In art the Muses are frequently represented. On the François vase, an Attic work of the early sixth century B.C., they appear at the marriage of Peleus and Thetis, with Calliope playing on a Pan's pipe at their head. Later artists used them freely, especially in connection with Apollo, or with the mythical poets Orpheus and Thamyris. On the basis by Praxiteles at Mantinea they are represented as present at the contest between Apollo and Marsyas. It is to be noted, however, that, while there is a tendency to develop definite artistic types for some of the figures, the division of the several branches of poetic art among the Muses and the adoption of fixed attributes to distinguish them is a product of a comparatively late period in the Roman Empire. Even the Hesiodic names did not designate the functions of the Muses, and in the popular usage seem to have been but little employed. The functions of the Hesiodic Muses were thus assigned in the later writers: Clio, history, Calliope, epic poetry; Polyhymnia, sacred hymns. Euterpe, music of the flute, lyric poetry; Terpsichore, melic poetry and the dance, Erato, the choral lyric; Melpomene, tragedy, Thalia, comedy, Urania, astronomy. The Romans identified the Greek Muses with their own Camenæ (q.v.). Some variations in this classification are found. Consult: H. Deiters, *Ueber die Verehrung der Musen bei den Griechen* (Bonn, 1868). O. Bie, *Die Musen in der antiken Kunst* (Berlin, 1887); the article "Musen" in W. H. Roscher,

Lexikon der griechischen und römischen Mythologie, vol. ii (Leipzig, 1890-97). Arthur Fairbanks, *The Mythology of Greece and Rome* (New York, 1907). See also the articles on the individual Muses.

MUSES' LOOKING-GLASS, *THE*. A play by Thomas Randolph published in *Poems with Muses' Looking-Glass and Amintas*, 1638. An altered version, entitled the *Mirror*, appeared in 1758.

MUSEUM, mû-zē'um (Lat. *museum*, from Gk. *μουσείον*, *mouseton*, temple of the Muses, place for study, museum, from *Μοῦσα*, *Mousa*, Muse). An institution for the preservation, study, and exhibition of objects of art or those of natural origin. The term was originally applied to a place or temple sacred to the Muses, but a little later was bestowed on institutions for the pursuit of the higher branches of learning, such as art and philosophy, the first recorded use of the word for this purpose being the famous *Museum* of Ptolemy Soter at Alexandria. The application of the word to institutions for the preservation and exhibition of works of art or specimens of natural history is comparatively recent, as are the institutions themselves, and seems to have come into vogue with the systematic gathering of objects for public exhibition. Such collections were originally known as cabinets, and while the term was to some extent restricted to small private collections, it was also given to many of very considerable size, such as the State Cabinet of Natural History at Albany, N. Y.

The germ of the modern museum has been thought by some to lie in votive offerings placed in pagan temples or deposited in churches, and in objects of sacred or historical interest preserved in churches and monasteries. And it may be said that one of the earliest references to the preservation of specimens of natural history is the account of the skins of what are now supposed to have been gorillas brought home by Hanno and presented by him to the Temple of Astarte in Carthage. Museums of art and of natural history had their origin in collections made by the rich and powerful without at first a more definite purpose than to gratify their own pleasure or curiosity. Somewhat later men of science gathered material to further their own special lines of research, and many of these private collections eventually developed into public museums. Thus some of the national museums of Europe had their beginnings in collections made by former sovereigns, while the British Museum grew out of the cabinet and library of Sir Hans Sloane. The Ashmolean Museum, at Oxford, England, was the result of the labors of Elias Ashmole, who began collecting in 1667, while the Museum of the Royal College of Surgeons, London, is based on the anatomical material gathered by the famous surgeon John Hunter, and the Hunterian Museum of the University of Glasgow was founded by his brother, William Hunter. It may be of interest to note that the exploration of America did much to promote the growth of museums and that the cabinets of Sloane and Ashmole, particularly the latter, comprised many specimens from the New World. Incidentally, too, public houses may be credited with some slight share in the development of museums; for, in England at least, they formed small collections of curiosities to attract visitors, and Artdedi, in his work on fishes, mentions three taverns where

he had seen specimens of American fishes. Directly related to these, and representing another stage in the development of museums, was the establishment of miscellaneous collections, more or less scientific in their nature, to which visitors were admitted upon the payment of a fee. President Adams mentions a collection of this sort in Norwalk, Conn., formed by a Mr. Arnold prior to the Revolution, but the best of the type in America were those of the Peales in Philadelphia and Baltimore. Two noteworthy foreign collections were those formed by Sir Ashton Lever, at Manchester, in 1775, and by William Bullock somewhat later at Liverpool. These were eventually taken to London, where they flourished at different periods, and their importance may be inferred from the fact that when these collections were sold various foreign museums sent representatives to attend the sale. Such large private establishments were the immediate precursors of the present state and governmental institutions. These represent the general acknowledgment of the value of museums, and are held to mark a stage in the progress of civilization beyond that of the art gallery or library, since the development of science is far later than that of art or literature.

Great public museums are of comparatively recent date, for while Bacon in his *New Atlantis* outlines such an institution, the establishment of the British Museum in 1753 was the first realization of this idea. In 1789 France transformed a royal into a national collection by opening the Louvre to the public, but the United States did not formally establish a national museum until 1876, although it practically came into existence in 1846, when the Smithsonian Institution was made the custodian of the national collections. The influence of the many expositions held during the latter half of the nineteenth century on museums has been very great; the construction of the first building for the United States National Museum was a direct result of the Centennial Exposition of 1876, and the Field Museum of Natural History, Chicago, owes its origin to the exhibition of 1893. The South Kensington Museum, now called the Victoria and Albert Museum, in London, the Ethnological Museum of the Trocadéro in Paris, and the Glasgow Art Gallery and Museum are largely due to similar causes.

The development of museums has not merely been in their size and number, but in their scope and functions as well. Originally the specimens exhibited comprised the greater or more important portion of the collections, and were mainly for the benefit of men of science. The modern plan, especially in museums of natural history, is to restrict the number of pieces on exhibition and to select for this purpose those of the greatest educational value, the bulk of material is placed in the reserve series, and is kept thus not merely for study, but for its better preservation, since light is one of the greatest enemies of museum specimens. The constantly increasing size of collections has had something to do in shaping this policy, but it is largely the result of a recognition of the fact that, so far as the general public was concerned, the educational influence of museums depended more on the quality of the things exhibited than on quantity. This has led to careful study of the best methods of arranging and labeling objects on exhibition and so displaying them that they may attract and interest even

the casual visitor. No man probably had more to do with bringing about this state of affairs than the late Sir William Flower, Director of the Museum of the Royal College of Surgeons, and subsequently of the British Museum, while in the United States Dr. G. Brown Goode (q.v.) stands preëminent among those who have been most instrumental in making museums instructive to the public. There has been a corresponding evolution in the publications issued by museums, in making them of interest to the general public and not restricting them to papers of a technical nature. We have seen that private collections were formed not only for the preservation of material, but for its study, and this led to the publication of information thus acquired. The germ of museum publications, however, is to be found in the illustrated descriptive catalogue of small private "cabinets." The oldest of these works is that issued by Gesner in 1565, describing one of the first systematic collections, that of Johann Kentmann of Dresden. Public museums have followed the same path as private collectors, and while, like individuals, their publication was at first through the medium of scientific societies, the tendency is for museums to become their own publishers. As the transfer of great collections from private to public ownership made them accessible to a greater number of students than before, this in turn has led to the issuing of memoirs by other than regular members of their staff. Many museums also issue guidebooks, handbooks, or articles of a somewhat popular nature relating to their collections, and in line with this are courses of lectures on topics illustrated in the various departments of the institution. The steady trend of museum development has been in the line of extending their educational influence and making them of value to the many instead of to a favored few. Dr. Goode summed up the objects of museums as record, research, and education, the preservation of material, its study, and the publication of information in the shape of books, and the spread of knowledge by the display of specimens. In a broad way museums may be divided into museums of natural history and museums of anthropology, the former including all natural objects, the latter man and his works. Following Dr. Goode, they may be classified under the following heads: museums of art, natural history, history, anthropology, technology, and commerce. Or, following the same authority, museums may be classed according to their purposes as national, local, provincial, or city, college, or school, professional, or class museums, and museums of special research.

The exhibits of art museums call for a somewhat different arrangement from those noted above, for the æsthetic enjoyment of art objects is at least as important a factor as their educative value. This was formerly the guiding principle in the arrangement of art museums. The finest specimens were placed in a single room, as in the Tribuna of the Uffizi, or the Salon Carré of the Louvre. But it soon became evident that works of art are seen to best advantage with those of the same epoch and school, and this classification has been generally adopted. Furthermore, it is essential that all important examples should be on exhibition. The establishment of art museums began in Italy, where in the fourteenth century the rulers and the nobility began to make collections of

coins and gems. Busts and statues were added later, and it was not until the seventeenth century that pictures and drawings were also introduced. The oldest important collections on record are those brought together by Cosmo de' Medici (1389-1464), which, with the other Medicean treasures, form the nucleus of the present Florentine collections, particularly rich in Renaissance art (See UFFIZI PALACE, PITTI PALACE.) The two chief museum centres of Italy, besides Florence, are Rome, with the magnificent papal collections of the Vatican (q.v.) for classical, and the Lateran for Christian, art, besides important museums belonging to the state, and Naples, whose museum is particularly rich in classical (Greek) antiquities. Almost every important Italian city has a noteworthy museum. (See VENICE, MILAN, ETC.) The principal museum of France is the Louvre (q.v.) in Paris, the provincial collections are important only for local antiquities and French painting. Among German cities, Berlin has a fine group of well-arranged museums, representing all branches of art; Dresden is particularly rich in painting, Munich in antique sculpture and painting, and Nuremberg in the decorative arts. Vienna also has a fine group of museums, of modern construction and particularly rich in painting. The principal collections in London are the British Museum, the National Gallery, and the Victoria and Albert Museum (qq.v.) The Rijks-Museum in Amsterdam is the most important in Holland; the Prado (Madrid) in Spain; and the Hermitage, Petrograd, in Russia. There are museums of some importance in all the Scandinavian capitals, and at Zurich and Basel in Switzerland. The museums of Athens are important for the study of originals of Greek sculpture, and that of Cairo is by far the richest in Egyptian antiquities. In the United States the oldest public museum is that of the Pennsylvania Academy of Fine Arts (1805), the most important is the Metropolitan Museum of Art (q.v.), in New York, and next to it the Museum of Fine Arts in Boston. Other noteworthy museums are the Art Institute, Chicago (1879), the Corcoran and National galleries, at Washington, and those of Worcester, Mass., Buffalo, Detroit, Toledo, Pittsburgh, St. Louis, and San Francisco. During recent years art museums have been established in almost every important American city. See articles on the various cities.

The museum of natural history covers a wide field and includes many branches, any one of which is capable of separate treatment. Thus there are museums of zoology, botany, geology, paleontology, and mineralogy, or paleontology may be included as a part of a zoological, geological, or anatomical museum. The natural history collections of the British Museum constitute the largest and most celebrated museum of natural history in the world, while other famous collections are those of the Jardin des Plantes, Paris, and those of Vienna, Leyden, and Berlin. The most important museums of natural history in the United States, all of which have been extended beyond the province indicated by the name, are the collections of the United States National Museum at Washington, the American Museum of Natural History in New York, and the Museum of Comparative Zoology at Cambridge, Mass.

Historical museums are for the preservation of objects illustrating the history of any coun-

try, place, or period, or the development of some special subject, and here they may trespass on the province of the museum of art or of technology. Historical collections form a branch of the United States National Museum, but there are many local collections. The National Museum, Munich, is an example of a general historical museum, the Cluny Museum, Paris, is devoted to a single period, the Naples Museum tells the story of Pompeii; while the Guimet Museum, Paris, illustrates the history of religious ceremonial, and the Museum of Artillery, Paris, traces the development of weapons from the rude axe of the Stone age to the modern rapid-fire gun. Anthropological museums, in the widest sense, treat of the history of man and his relations to the universe about him. This calls for illustrations of his various activities, so that an anthropological museum may comprise art and historical collections, although these are usually treated separately. The physical characteristics of man, his clothing, weapons, ceremonial objects, household furniture, methods of transportation and of shelter are the subjects most commonly illustrated. Ethnology is that branch of anthropology which deals with the characteristics, occupations, arts, and industries of the races of men as distinguished from one another. Archaeology treats of the history of ancient man, and sections of a large museum or an entire museum may be devoted to the illustration of either of these subjects. The department of anthropology of the United States National Museum is very extensive, and so is that of the American Museum of Natural History, New York. The Peabody Museum of Archaeology and Ethnology, Cambridge, Mass., is particularly rich in American antiquities, and so is the Archaeological Museum of the University of Pennsylvania. Abroad there are important anthropological museums in Berlin, Dresden, and Munich, the Trocadéro, Paris, and the Pitt Rivers collection at Oxford, the latter being specially arranged to illustrate the development of the arts.

Technological museums deal with various phases of the industrial arts. They display specimens of the raw materials that enter into the composition of a given product, trace the various processes to which these are subjected, show the tools or machinery by which they are manipulated, and finally the finished object or substance. The subjects for technological museums are almost endless; shipbuilding, spinning and weaving, dyestuffs, drugs, foods, and electric apparatus naturally suggest themselves. The South Kensington Museum (now the Victoria and Albert), London, contains a larger technological collection than any other institution. This is now under the charge of the National Board of Education, and its influence is not confined to London, for a part of its work consists in lending carefully selected collections to local museums and technical schools in other portions of Great Britain. Certain collections, including those illustrating marine architecture and engineering formerly in the Victoria and Albert Museum, have been taken to form the Science Museum, located near by. In America, the United States National Museum and the Field Museum of Natural History, Chicago, have important technological sections, the former having much material illustrating the development of electrical apparatus, while the latter is rich in objects showing the growth of methods of trans-

portation by rail. The technological and historical collections of the United States National Museum now practically constitute a separate museum though under one control. The Army Medical Museum, Washington, while devoted to the subject of the structure of man, the effects of injuries and diseases, and their treatment, is a technological museum in so far as it traces the development of surgical appliances. Commercial museums are devoted to advancing the interests of trade. They exhibit raw materials and finished products, illustrations of methods of packing and modes of distribution, and gather and furnish information as to prices and character of goods needed in and furnished by different countries. Laboratories for the analysis of various substances and the testing of materials form part of the equipment of such an institution. The Musée de Mille, Ghent, is one of the oldest European commercial museums. The Commercial Museum, Philadelphia, is the sole institution of its kind in the United States.

The past 15 years have seen many museums, varying widely in their scope, founded in many countries, have witnessed an increasing recognition of their educational value and the establishment of more direct relations between museums and schools. These have been brought about by courses of lectures, loan of material, arrangement and labeling of exhibits, while direct provision is frequently made for children either by special museums or by setting aside certain rooms or collections.

MUSEUM PEST. Any one of several species of insects which feed upon the prepared and mounted skins of birds, mammals, reptiles, and upon dried collections of insects and other animals preserved in museums. Perhaps the most abundant and injurious of the museum pests are the beetles of the family Dermestidae. (See DERMESTID BEETLES, also BACON BEETLE and CARPET BEETLE.) Others of these insects are the larvae of small moths of the tineine series. Some of the common clothes moths (q.v.) are museum pests which, possibly originally feeding upon skins, have come to feed upon fabrics made from animal substances, such as wool or hair. One of the most injurious of this group is *Tinea pellionella*, which is one of the case-making clothes moths. Other substances stored or displayed in museums are attacked by other insects: the larva of a little geometrid moth, known as *Carphozera ptelearia*, feeds on dried plants stored in herbaria; and the allied *Acidalia herbariata*, as its name indicates, has long been known to injure herbarium specimens in Europe, but is on the whole more injurious in herbalists' shops than in museums. Some of the dermestid beetles will even injure the horns of large mammals, and the bones as well, provided they are not thoroughly poisoned. A museum room once thoroughly infested with these creatures can be most readily freed from them by fumigation with bisulphide of carbon or hydrocyanic-acid gas.

MUSGRAVE, mŭz'grāv, SAMUEL (1732-80)

An English physician and classical scholar, born at Washfield, Devonshire. He was educated at Oxford and, having received a Radcliffe traveling fellowship, spent some years abroad, visiting Paris (1756) to collate manuscripts for his edition of Euripides. He was in Paris again in 1763-64. From 1766 to 1770 he practiced medicine at Exeter and Plymouth. During this period he issued a pamphlet charging that the Peace of 1763 with France had been concluded only because certain members of the English ministry had been bribed by the French government. Discredited by an investigation into this charge by the House of Commons, he lived in modest circumstances in London till his death. He is now known chiefly for his edition of all the plays of Euripides (1778) and for his *Exercitationes Euripideæ* (1762).

MUSGRAVE, WILLIAM EVERETT (1869-

) An American physician, born at Farmington, Tenn. He graduated M.D. from George Washington University in 1901. In 1902 he went to Manila, Philippine Islands, where he was pathologist of the Bureau of Science until

1909, then chief of clinics at the Philippine General Hospital and at the University of the Philippines, where he was also dean and professor of medicine. In 1905-06 he was president of the Medical Society of the Philippine Islands. In the *Bulletin of the Manila Medical Society*, which he edited, various of his papers appeared.

MUSGU. See MOSGU.

MUSH, mōōsh. The capital of a sanjak in the Vilayet of Bitlis, Asiatic Turkey, on the east branch of the Euphrates, 80 miles south of Erzerum (Map: Turkey in Asia, D 2). It lies at an elevation of 4200 feet at the entrance to a mountain ravine on the south side of a fertile wheat, vine, and tobacco growing plain. The town is noted for its uncleanness and has few good houses. It is the see of Roman Catholic and Gregorian bishops and has an American mission with Protestant schools. There is an active trade in the agricultural products of the district, and embroidered caps are manufactured. It has historical reminiscences of Xenophon and of Moses Khorene, the historian. In the vicinity at Sasun occurred a terrible massacre of Armenians by the Turks in 1894. Pop., about 27,000, one-half being Armenians.

MUSHET, ROBERT. See IRON AND STEEL, METALLURGY OF, *Bessemer Process*.

MUSHKAIA, or MUSHKI. See MOSCHI.

MUSH'ROOM (OF. *mouscheron*, *mouseron*, from OF., Fr. *mousse*, moss, connected with AS *mōos*, OHG *mios*, *mos*, Ger. *Mies*, *Moos*, OChurch Slav. *mūchŭ*, Lat. *muscus*, moss). The popular name of edible fungi of the family Hymenomycetaceæ, especially species of *Agaricus* and *Morchella*. The name "toadstool" is generally applied to species which have an umbrella-shaped cap. The common idea that all such are poisonous is erroneous, because some of the most highly prized species have this habit of growth, and perhaps most of the others are not injurious. The mushroom as it is generally seen is only the fruiting body of the fungus, which arises from a more or less matted mycelium or spawn. The mycelium or vegetative part consists of numerous slender white threads running in every direction through the soil. Upon these threads small knots develop, increase in size, and finally appear as the ball-like or button-like young mushrooms, which consist of a stalk, terminated by a cap or pileus, bearing upon its underside numerous thin spore-bearing plates or gills radiating from the centre or attachment of the stalk. Near the top of the stalk is a more or less perfect ring (annulus), the remnant of the delicate veil (indusium) that covered the gills during the button stage, but ruptured as the mushroom grew.

The common mushroom (*Agaricus campestris*), one of more than 1000 species of the genus *Agaricus*, is common in fields and pastures, seldom in woodlands unless open and grassy, growing throughout the summer, but most abundant in the early autumn. It is the most commonly cultivated species, is extensively grown for market, especially near large cities, and is about the only species imported and offered for sale in American markets. This species never attains a very large size, when young the stalk and fleshy cap are white, changing to light brown when older. The stalk is solid and tapers slightly towards the base. The ring is usually conspicuous, the gills pink when young, changing to brownish purple in older specimens. Mushrooms are usually gathered for market when in the ball or button stage before the veil has been

broken. They have a pleasant taste and smell and, when the flesh is bruised, turn a reddish brown. The horse mushroom (*Agaricus arvensis*), a close relative, looks very much like the common mushroom, but is much larger, and the top of the cap is more shining white. The stalk becomes a little hollow with age; the gills are white at first, changing to brownish purple when comparatively old.

The methods employed in cultivating the common mushroom do not offer any great difficulties. They may be grown out of doors or where the temperature is fairly constant, as in dry cellars or in caves, abandoned mines, and quarries. Beds are made containing at the bottom a deep layer of fresh stable manure, over which is a layer of well-rotted manure. In this the spawn is planted after the temperature of the bed has fallen to about 90° F. The commercial spawn comes in two forms, bricks and flakes, made of horse manure impregnated with the mycelium of the fungus. When planted, both kinds are broken up and distributed through the bed. The beds, which must be kept moist, but not wet, are then well covered with straw or mats to keep the surface moist. After a week or 10 days the mulch is removed and the beds covered with good loam to a depth of 2 inches. They may be again covered with the mulch, which should be removed when the mushrooms, which should be gathered daily, begin to appear. Mushroom culture is sometimes interfered with by parasitic fungi, especially by species of *Mycogone*, and serious losses have been reported in Europe and America. The parasite discolors and distorts the mushroom and may cause failure of the crop. The removal of all diseased mushrooms and the fumigation of houses and caves with formaldehyde gas are recommended as preventive measures.

In addition to the species of *Agaricus* described above, there are a great many other edible species of mushrooms belonging to other genera. Among them are the horsetail or maned agaric (*Coprinus comatus*), the ink caps (*Coprinus atramentarius*), and the glistening comatus (*Coprinus micaceus*). These have black spores, the cap does not expand, but remains more like a partly closed umbella. When old, these species become very watery and dissolve, forming a black, inky fluid. For eating they should be taken only while young. The parasol fungus (*Lepiota procera*) is a white-spored edible mushroom rather abundant in grassy places. It is rather tall on a slender stem. The cap is whitish or light brown and covered with coarse scales. The ring is free and not fastened to the stalk. Another highly prized species is the chanterelle (*Cantharellus cibarius*), an egg-yellow species common in moist woods. The cap has an irregular, crumpled margin, is more or less depressed on the upper surface, and has shallow, blunt gills prolonged down the stalk. The fairy-ring fungus (*Marasmius orcadus*), common in lawns and meadows, is also edible. There are some species having the same habit of growing in circles that are reputed poisonous. The edible ones are white-spored, have hollow stalks, and are seldom more than 2 inches across the pale-yellow or drab cap, which is often concave on top and raised in the centre. One class of gill-bearing fungi exude, when broken, a milky juice. The species of this kind belong to the genus *Lactarius*. Some have a very acrid juice, but one (*Lactarius deliciosus*) is considered very choice by mushroom lovers. It grows

in damp woods in mountainous regions, but is not common in lowlands. It cannot be mistaken for any injurious species, as the milk exuded by it is always red with a tinge of orange and slowly changes color to greenish. The fungus is a little lighter in color than the milk exuded by it.

Boletus is another of the common genera. The species are rather difficult of identification and should not be eaten by a novice. Some of the *Gasteromyces*, e.g., the puffballs (*Lycoperdon giganteum* and *Lycoperdon cyathiforme*), are common edible species. The former attains a diameter of 10 inches or more and has a smooth, white, kidlike surface when young, with a firm white or pale-yellow flesh. The other is 6 inches in diameter, flattened and tessellated on top, and contracted at the base. In color it varies from white to brown. The puffballs should be taken while young and before the spores are developed. One species (*Scleroderma vulgare*), related to the ones just described and suspected of being injurious, may be recognized by its tough, hard, yellowish-brown, warty exterior and purplish-black interior mottled with white. Among the most highly prized of edible fungi are the morels and truffles (*Tuber melanosporum*).

Since several species of mushrooms have not yet been proved harmless and since occasional cases of poisoning are still attributed to their use as food, the following rules, formulated by Farlow, are given as guides for the inexperienced collector. "Avoid fungi when in the button or unexpanded stage, also those in which the flesh has begun to decay even if only slightly. Avoid all fungi which have stalks with a swollen base surrounded by a sac-like or scaly envelope, especially if the gills are white. Avoid fungi having a milky juice, unless the milk is reddish." These rules are not absolute, because there are exceptions to them, but are safe for the novice to follow. See FUNGI, EDIBLE AND POISONOUS.

Mushrooms as Food. Since mushrooms and other edible fungi are often said to be nutritious food, to contain large quantities of protein, and to rank close to meat as sources of nitrogenous material, extravagant statements have been made concerning them. When fresh, mushrooms have the following percentage composition: water, 88.1, protein, 3.5, fat, 0.4, nitrogen-free extract, 6, crude fibre, 0.8, ash, 1.2. Other edible fungi closely resemble them so far as analyses have been reported. Like all green vegetables mushrooms have a high water content in proportion to their bulk, and, as regards protein content, they rank about the same as potatoes, to which they are decidedly inferior in food value, since they contain much less carbohydrates, and the nitrogen present is largely in the form of non-albuminoids, which are thought to have little food value. The numerous studies which have been made show that mushrooms are not thoroughly digested. Recent experiments show that 25 to 59 per cent is indigestible. See FUNGI, EDIBLE AND POISONOUS.

MUSHROOM GNAT. The name given by mushroom growers to any of the fungus gnats of the family Mycetophilidae (See GNAT.) These are small, mosquito-like creatures with feathered antennae and frequent, as a rule, vegetable matter or fungi, upon which their larvae feed. The larva are slender, white, wormlike creatures, with a distinct black head. The larva of one species of the genus *Sciara* is especially injurious to mushrooms, which it eats into and ruins. In mushroom cellars, fumigation with tobacco or pyrethrum will kill the flies.

MUSHROOM POISONING. A severe and frequently fatal form of poisoning from eating noxious varieties of mushrooms or other fungi, the most common being the fly fungus, or *Amanita muscaria* (see AMANITA), the active principle of which is muscarine. Individuals who have eaten a poisonous fungus are seized within a short time thereafter with severe abdominal pains and rapidly become cyanosed, collapse and muscular spasms set in, soon followed by death, unless prompt treatment is instituted. The treatment is to wash out the stomach with a stomach pump, empty the intestines by means of a purge, and administer stimulants. The physiological antidote for muscarine is atropine, this or tincture of belladonna should be given as soon as the stomach and bowels are emptied. See FUNGI, MUSHROOM.

MUSIC (OF, Fr *musique*, from Lat. *musica*, from Gk. μουσική, *mousikḗ*, music, from μουσικός, *mousikos*, relating to the Muses, from Μοῦσα, *Mousa*, Muse). Music is a mode of motion. It is a modification by art of aerial vibrations, whose impact upon the auditory nerve makes mental varying images. Sound, the raw material from which music is fashioned, is produced by motion.

Matter is the stimulus, sensation is the result. "The kind of motion, however, that goes to produce sound is not that of matter precisely, but rather of the molecules or ultimate particles of which matter is composed. When the state of equilibrium of an elastic body is disturbed by a shock or by friction, it tends to regain its condition of equilibrium, but does so only after a greater or less number of vibrations, or oscillating movements, of the molecules of which the mass of the body is composed." Thus J. A.

Zahm, a profound investigator in acoustics and a follower of the great Helmholtz, whose masterly tonal researches are set forth in his *Die Lehre von den Tonempfindungen*. The nature of sound, Lord Bacon observes, "in general hath been superficially observed. It is one of the subtlest pieces of Nature." The nineteenth century has endeavored to wipe away Bacon's reproach, for the studies and experimentings of such men as Helmholtz, Rudolf König, Blaserna, Tyndall, Stumpf, and others have lifted into light the darkest problems of acoustics. The latest researches teach us that sound vibrations—vibrations audible to the ear—have a rapidity which ranges from 16 to 36,500 per second. Heat vibrations begin at 134 trillions per second; light vibrations, visible to the eye, at 483 trillions. The gamut of the rainbow has its velocity measurements. Chemical vibrations, "shown only by certain reactions in prepared photographic plates," are beyond our sense perceptions. Sonorous vibrations, then, are really the slowest of all. Dr. William Ramsay asserts, in his *Essay on Smell*, that the sense of smell is excited by vibrations of a lower period than light and heat. Sounds of a musical character rarely extend beyond a minimum of 16 and a maximum of 4138 vibrations, respectively the rates of vibration of the lowest tone of an organ with a pipe of 32 feet and the top note of a piccolo. The production of sound, its transmission, and its aural perception may all be demonstrated with a long piece of stretched string. In its position of equilibrium it represents a straight line. Pluck it and its elasticity will cause it to return. This is a simple vibration. But the string also goes in the opposite direction, and this is a double vibration. Like a pendulum the vibrations of the string are isochronous, each occupying exactly the same length of time. By shortening the string or increasing its tension we get vibrations of various velocities, and the ear perceives various pitches from 16 vibrations to the second up to 4224 vibrations. Increase the tension beyond this point and shrillness results, below 16 a dull unmusical whirring. The same results acoustically may be produced with pipes of varying lengths. The vibrations are, as in the case with strings, isochronous, they vary in rapidity according to the length of the pipe; subdivide them and harmonics are produced. Nodes and vibrating segments are the crude material of music; pitch, loudness, and timbre or quality determine the tone. All these qualities depend upon the rapidity of the vibrations. It is demonstrated that the number of vibrations of strings is inversely proportional to their length; that the number of vibrations of strings is in inverse ratio to their diameter, that, experimenting with two wires at tension, but of differing density, we get the rule that the number of vibrations of a string is inversely proportional to the square root of their density, finally, as Helmholtz shows by varying the stretching weight, that the number of vibrations of strings is directly proportional to the square root of their stretching weights. Thus, the longer, thicker, heavier a string is, the slower are its vibrations and the deeper is its tone. The shorter, finer, lighter, tenser it is, the more rapid are its vibrations and the higher is its tone. Now the sound produced by a string vibrating its entire length is its fundamental or natural tone. It can produce many other sounds at the same time, subdividing them as it vibrates:

these are the overtones or harmonics, partial and concomitant sounds. The series of harmonics theoretically may be divided infinitely, but for musical purposes they are numbered in accordance with the number of vibrating segments or loops. The nodes exceed by one in number the loops, taking the ends of the tense string as nodes. The fundamental vibrating with one loop is the first harmonic of the tone, and the harmonics on the numerical order are constantly nearer and nearer together, the successive intervals being an octave, fifth, fourth, third, second. We are at the very beginnings of the scale. The clay is ready for the musical sculptor. Mersenne's law is that the loudness of sound varies inversely as the square of the distance of the sonorous body from the ear. So the range of audition is over 11 octaves, but this is for an exceptional ear.

Musical sounds differ from each other in loudness, in pitch, and in quality. Biot says that "all sonorous bodies yield simultaneously an infinite number of sounds of gradually increasing intensity." This phenomenon is similar to that which obtains for the harmonics of strings, but the law for the series of harmonics is different for bodies of various forms. May it not be this difference which produces the particular character of sound, called timbre (*Klangfarbe*, clang tint), which distinguishes each form of body and causes the sound of a string and that of a vase to produce in us different sensations? May it not be owing to the diminution of the intensity in harmonics of each series that we find agreeable certain concords that would be intolerable if produced by sounds equally loud? And may not the quality of each particular substance—of wood or metal, e.g.—be due to the superior intensity of one or another harmonic?

We have now some dim idea of the natural laws which give us force or loudness, pitch, and quality in music. The whole subject in all its fascinating range and variety is admirably treated in Zahm's *Sound and Music*. Therein may be learned much about the production and transmission of sound, its velocity, reflection, refraction, resonance, and interference. Of pitch it may only be said here that its standard in music is the A string of the violin, which gives the tuning note for orchestras. It corresponds to *a'* above middle C of the pianoforte. *a'* as a vibration number of 435 was chosen in 1859 as a standard pitch. This is called the French pitch, and its exact vibrations are really 435.45. It is the standard pitch of our orchestras and since 1892 for all pianofortes. (See PITCH.) All the modifications of sound made by the ingenuity of man in his inventions of string, wood, brass, pipe—as in the organ—and percussion instruments, from the drum to the piano, give us variety in tonal timbre and are based on the human voice, which with its bass, tenor, alto, and soprano served as a model for the viol family.

Helmholtz has considered the analogies of light and sound, both being modes of vibratory motion. In his psychological optics he gives the following analogies between the notes of the piano and the colors of the spectrum:

F#	End of the red	d#	Cyanogen blue
g	Red	e	Indigo blue
g#	Red	f	Violet
A	Red	f#	Violet
A#	Orange-red	g	Ultra-violet
B	Orange	g#	Ultra-violet
C	Yellow	a	Ultra-violet
C#	Green	a#	Ultra-violet
d	Greenish blue	b	End of the solar spectrum

Upon this laboratory experiment some imaginative theorists have endeavored to rear a system of musical aesthetics, but unsuccessfully, though we have come to speak naturally of color in music. Tone and color, while related, as are all things mundane, are far asunder in terms of art, in fact, when used in their proper meaning, they constitute the foundation of two widely different arts—music and painting. Whenever the musician speaks of "color," he employs the word only with a figurative meaning, as synonymous with "timbre," "clang tint." Especially the modern school of piano playing is concerned with "tonal color," a term denoting those infinite and subtle varieties of tone produced by the different touches.

In March, 1915, the Russian Symphony Orchestra produced in New York a symphonic poem, *Prometheus*, by Scriabine (q.v.), in which the composer actually carried out Helmholtz's theory. As each chord was played its corresponding color was projected on a screen. The verdict of all musicians was unanimous—that no relation could be perceived between sound and color.

As the receptive organ of tone and its transmitter to the brain, the ear plays as important a part as tone itself. Without it there would be no music, paradoxical as it may sound, for it is the eye that perceives, the ear that hears, the hand that feels, which give us our picture of the world. Under this hypothesis the world, then, is idea, idealists and materialists meeting amicably on the little strip of territory called sensation. The complete apparatus of the ear, the wonderful "lute of three thousand strings," called the cortical fibres after their discoverer Corti, should be carefully investigated by the student. We may now truthfully affirm, after briefly studying the production of sound and its modifications by instruments, that music is a mode of motion.

But music as a pleasure-evoking emotion! Whence comes it, what is its psychologic basis? It is purely human, for not the most fanciful of poets or extravagant of psychologists can torture into formal beauty the songs of birds, the growling of the tempest, the sound of the sea. All these things and many more may furnish the starting point, the springboard of the composer's imaginings, but artistic they are not. There is no real music in nature. As a play impulse, art has been considered and discussed by many modern writers. Schopenhauer, whose intuitions are often superior to other men's logic, calls art "a momentary liberation," and Herbert Spencer develops his idea, linking it with biological conditions. In his *Principles of Psychology* he says that a characteristic of nerve processes is that the superfluous integration of ganglion cells should be accompanied by an inherited readiness to discharge. Thus the "aimless activity" we call play is the result of a force expended, a force that man as a highly developed animal has more of than is needed for the struggle of existence. In many animals he finds imitation a factor, but Karl Groos in his *Play of Man* believes in impulse and intuition—"the inherited impulse towards prescribed reactions in certain brain tracts seems to be in itself a sufficient cause for play without the necessary accompaniment of superfluous energy." Schiller calls play a harmless expenditure of exuberant strength which is its own excuse for action. Lazarus is the exponent of the reaction theory. When we are

tired of natural or physical labor, we play, thus recreating ourselves. Professor Groos, however, finds in both the surplus expenditure and the recreation theories only partial statements of the truth. For him play is the impulse towards repetition, and this is a physiological reason for playing to the exhaustion point, which we notice so often, even if we are tired at the beginning. "Let us recall first," he writes, "the tremendous significance of involuntary repetition to all animal life, for just as the simplest organisms in alternate expansion and contraction and the higher ones in heartbeats and breathing are pervaded by waves of movements, so also in the sphere of voluntary activity there is a well-nigh irresistible tendency to repetition." Play, too, furnishes distraction from quotidian cares. It is an educational factor of prime importance, elaborating immature capacities and influencing the evolution of hereditary qualities. Schiller declares that man alternates between weak and sensuous pleasures, and his dictum that man is fully human only when playing has, as Professor Groos declares, "definite biological meaning." Conrad Lange defines art "as the capacity possessed by men of furnishing themselves and others with pleasure based on conscious self-illusion, which by widening and deepening human perception and emotion tends to preserve and improve the race." This is but an amplification of Schiller's remark. And art is but the play impulse immeasurably elevated, yet at its roots possessing a sham objective character. The earliest form of musical art, the pantomimic dance, was "an expression of muscular force simulating the acts of life." It was symbolical, it expressed a feeling, a state of mind. In its genesis art was play of a semphysiological character. Primitive dancing comprised music and poetry in solution, later on they became separate and independent arts. Rhythm, the father of organized music, played a big rôle, for rhythm is cosmic, it is manifested in the heartbeat—the unit of measure for all the temporal arts—the tides and the movements of the bodies in the interstellar depths. Dancing accompanied by rudimentary songs—perhaps of only two or three tones—is the first step of the musical art. Emotions were translated in the rough, yet effectively, the pantomime of the savages is always clear, attempting as it does the expression of love, anger, terror, hatred, and happiness. How much the sexual attributes play in the beginnings of art we cannot say, but music in the light of modern researches may no longer be called the Heavenly Maid. Far from it indeed, for, as Havelock Ellis truthfully says: "In music the most indefinite and profound mysteries are revealed and placed outside us as a gracious, marvelous globe, the very secret of the soul is brought forth and set in the audible world. That is why no other art smites us with so powerfully religious an appeal as music. no other art tells us such old forgotten secrets about ourselves. It is in the mightiest of all instincts, the primitive sexual traditions of the races before civilized man, that music is rooted. . . . The sexual instinct is more poignant and overmastering, more ancient than any as a source of beauty. Beauty is the child of love." Music is an emotion become aesthetic. Human beings, as Ribot says, began by thinking that beautiful which resembled themselves. Primitive art was addressed to the individual of our own species. As it became more disinterested it exhibited re-

ligious qualities and eventually was transformed into a ritual, a ceremony for the expression of awe or thankfulness to the deity. It had a specific character and one that had but remote affiliations with our modern conceptions of art. The natural extrusion of sympathy, the conquest of nature by the intellect, has given us two of the most modern arts—music and landscape painting. Neither of these had any real existence in the Old World civilizations; indeed, a feeling for nature in poetry and painting may be said to date from yesterday. The patient flowering of savage, rhythmic cries into the score of a Beethoven symphony is only comparable—to mention purely human processes—to the evolution from a South Sea Islander's simple mud hut to the magnificent complexities of a Gothic cathedral. From the sheltering needs of the body comes the noble art of architecture, from the social needs of intercourse, self-expression, come poetry and music. Both were the irrepressible and the irresponsible exhibition of surplus energy, of the play impulse. And on this side is music purely sensuous.

Kant defines the beautiful as that which "through the harmony of its form with the faculty of human knowledge awakens a disinterested, universal, and necessary satisfaction." We are now another remove from the utilitarian, for in a certain sense all art is useless, inasmuch as it bestows no material benefits. Its beauty is its excuse for being, and music, being the least representative of the arts, copying no material forms, is therefore easily the most ideal of all the arts and the most inutile. Apprehended in time and not in space, it addresses itself to the imagination. And here we are confronted by the crux of Hanslick and other aestheticians of the formal. "Definite feelings and emotions are unsusceptible of being embodied in music," he declares. Music does not express emotion, it expresses itself. It is sound play, it consists of exquisite arabesques, it is a formal pattern of tone, and all the wonderful things attributed to it exist only in the overheated imagination of its hearers. Precisely so, and it is this almost miraculous subjectivizing process that proves the weakness of Hanslick's thesis. No other art attacks so powerfully the emotions. "Music acts like a burn, like cold, heat, or a caressing contact. Music acts on the muscular system, on the circulation, the respiration . . . and is the most dependent on physiological conditions. The primary effect is a physical one." Beauquier says: "Musical vibration is only one particular mode of perceiving the universal vibration . . . Musical art is the art of sensibility par excellence, since it regulates the great phenomena of vibration into which all external perceptions resolve themselves and transfers it from the region of the unconscious, in which it was hidden, to that of consciousness." Again Ribot: "While certain arts at once awaken ideas which give a determination to the feelings, music acts inversely. It creates dispositions depending on the organic state and on nervous activity, which we translate by the vague terms joy, tenderness, serenity, tranquillity, uneasiness. On this canvas the intellect embroiders its designs at pleasure, varying according to individual peculiarities." Let us admit, then, with Hanslick and the formalists, that music does not *express* emotion; yet this does not preclude the idea of an emotional content in the listener, who projects his personality into the forms. In music

the forms and the subject are identical. we cannot dissociate the pattern of the love theme in *Tristan und Isolde* from its emotional effect. The sound once set in motion, we are at liberty to dream, to thrill, to weep, to sigh with all the moods superinduced by a master. And this playing upon our nerves, our imagination, is intentional. In modern times music has become an instrument of overpowering emotional significance. Eighteenth-century music, with its gay scheme of decoration, its pretty recurring patterns, its play of forms, and its freedom from the overwrought, the intense, can well be utilized by Hanslick as an example of music for music's sake. It expressed little in the latter-day connotation of the word, so to modern music, especially Beethoven, we might truthfully give the title of classic, as it fulfills many of the requisites of antique art—its dignity, symmetry, grandeur, and profound emotional quality. The position of the formalist school is based on a half truth. A study of the nature of emotions would have cleared the ground long ago of encumbering verbalisms. Ribot defines the technique of an emotion thus: "First an intellectual state, then organic and motor disturbances, and then the consciousness of these disturbances, which is the psychic state we call emotion." This clear definition of a very complicated process may be applied to the effects of music upon a sympathetic listener—naturally sympathy must be granted, else all music addresses itself to the deaf. A vast mirror of subjectivity, music appeals to each of us according to our temperaments. It paints upon the background of our consciousness enlarged meanings of ourselves. Composed of alternate sound and silence, it reaches our very soul with its rhythmic pulsings and sensuous qualities. It is at once the most impersonal and most personal of all the arts. It traverses the keyboard of our desires and arouses noble ambitions or sensual crises as well. It is an amoral art, it can be impressed with equal facility in the service of church or tavern. Its very plasticity makes it an agent for evil and nevertheless a powerful aid to worship. It is because of this easily molded nature that music has served in every camp, has gone to the wars, has sounded the psalms of peace, has been the bone of contention between warring schools and factions, has led the bride to the altar, and intoned the grief for one lying dead. Music, in some form or other, has always accompanied man on his march through the ages, tracing in spiritual mimicry his evanescent emotional gestures. Captive to his baser senses, a column of smoke by day, this agile protean art has played the pillar of flame, a burning eloquent sign in the darkened skies of revolt, superstition, and miserv. A potent symbol, "a mighty fortress" during the Middle Ages, music served the Church faithfully, and when enfranchised it has as faithfully recorded the great emotions of secular souls. Ariel and Caliban—to what purposes has this versatile art not been put? At first man played upon a reed to his mate, then he grew in love with his tune for its own sake. To-day, after putting the art through all its probable paces, it has been harnessed to the Drama, and, from being the exponent of pure, formal beauty, it is pressed into the service of the Characteristic. The Chinese, thousands of years ago, discovered the charm of ugliness, and it would seem that modern music is striving for that goal. Rosenkranz has written a volume on

Æsthetics of the Ugly, and in the general hurly-burly, topsy-turvy of the arts it would not be improbable if music played the part of devil's advocate in the new æsthetic dispensation. The line of demarcation between the beautiful and the ugly is slight, for beauty is a relative quality, and ugliness often proves its capital foil. To show how shifting has been the standard of musical beauty one has only to consult history or personal memories. A decade may transform the musical map, deposing reigning monarchs and elevating to the purple the veriest newcomer. Music is a fickle goddess.

How far symbolism may be pushed in music is seen in the attempts to pin down the phrase to precise meanings. It is true that there is a key symbolism, that not by chance have the great composers selected certain keys—keys that, in Wordsworth's happy expression, are inevitable. Beethoven's Fifth Symphony is inconceivable in C sharp minor or E flat minor. C minor is a portion of its life. Berlioz has compiled a table of key characteristics, and a certain theorist does not hesitate to call F major rugged, B major, energetic, E major, radiant, warm, joyous, A major, frank, sonorous, D major, gay, brilliant, alert, and so on through the list. Here again temperament counts, all else is purely arbitrary. Music has the power of evoking moods, that is a common experience, and it has on the formal side analogies to architecture, for it is structural, it is architectonic, and its subject is imitative of no known model. This has led Walter Pater to asseverate that all the arts in common aspire "towards music, music being the typical or ideally consummate art, the object of the great *Anders-Streben*—reaching forward—of all art, of all that is artistic or partakes of artistic qualities." It is "the blending of the animative thought and embodying vehicle," the absorption of the matter into the form of which music is the one perfect example among the arts, that attracted Pater. "All art constantly aspires towards the condition of music," he wrote, and made of sensual presentation, emotional suggestion, and technical perfection the archetype for all the arts. The danger of this view lies in the slighting of music's tremendous evocation of our subliminal depths, of spiritual shades. These cannot be exercised by technical loveliness or richness of emotional eloquence. Beethoven has taught us in his symphonies that from tone may be wrung almost an ethical meaning. The Platonic theory of an ideal type for all the arts could not have failed to impress Pater. But it stops at the outer porches of the ear, the tone which should penetrate to the inner sanctuary losing on the way some of its grosser connotations. His doctrine is that art is always striving to be independent of mere intelligence, that the vaguer the subject the greater the impact of the thrill upon our souls. Gustave Flaubert, who is the creator of both the realistic and the symbolistic school, had some such idea, for he wished his prose to be as independent as music, to float in mid-air by reason of its euphony and rhythm. And there can be no doubt that it is the perfect balance found in Beethoven's phrases, both the meaning and the music, that makes of them the greater type for all future symphonists. Poetry is the usual standard for painter, poet, sculptor, and composer, and, as John Addington Symonds shows, this is as much of a heresy as Pater's. F. W. H. Myers writes: "The range of human thoughts and emotions greatly transcends

the range of such symbols as man has invented to express them, and it becomes, therefore, the business of art to use these symbols in a double way. They must be used for the direct representation of thought and feeling, but they must also be combined by so subtle an imagination as to suggest much which there is no means of directly expressing. This power gives birth to the art of the musician, whose symbols are hardly imitative at all, but express emotions which, till music suggests them, have been not only unknown, but unimaginable." To each art its particular province. There is music in Milton; Wagner is a great painter, Bach an architect, and through the marmoreal prose of Flaubert rings the sound of the sculptor's chisel. But this "reaching forward" is, as Symonds says, "at its best a way of expressing our sense of something subjective in the styles of artists or of epochs, not of something in the arts themselves." The subjectivity of a critic prompts him to select a particular art as the type for all. Wagner, in a superb effort, attempted to house all the arts within the walls of a mighty synthesis. Music, however, won the victory; it is Wagner the composer who will live, not Wagner the dramatic poet or Wagner the scene painter. The intellectualists are quite as wrong in their endeavor to force upon music the office of preacher or philosopher. By reason of its limitations music is not well adapted for the expression of an intellectual content. It gives us the maximum of sensuous effect, though we do not agree with Symonds that in it is the minimum appeal to the intelligence. If this were so, Bach, Beethoven, Chopin, Brahms, Wagner, Richard Strauss would not be in the same category with Dante, Michelangelo, Milton, Shakespeare, Shelley, Swinburne, and Rodin. Besides, has not Spencer said, "The emotions are the masters, the intellect is the servant?" Great intellectuality, great emotional temperaments go to the making of great composers as well as of great architects, poets, dramatists, painters, and sculptors. Architecture is not emotional like music, but it is more concrete, it arouses the sense of the sublime—which music does, too, under certain conditions. Sculpture is impressive in its symbolism of the human form and its evocation of harmonious lines, of all the arts it is the most unlike music. Painting, with its illusions of life on a flat superficies, has certain affinities with music, while music and poetry have several qualities in common—the subtleties of sound and the power of continuous narration—though here music speaks a tongue not to be translated into words. It gives the sense of situation, not action, the prism of the arts, as Symonds phrases it, "each distinct, but homogeneous, and tintured at their edges with hues borrowed from the sister arts. Their differences derive from the several vehicles they are bound to employ. Their unity is the spiritual substance which they express in common. Abstract beauty is one and indivisible. But the concrete shapes which manifest this beauty decompose it, just as the prism analyzes white light into colors."

MUSIC, CONSERVATORY OF. A school for instruction in music. See CONSERVATORY.

MUSIC, HISTORY OF. The beginning of music goes back to the beginning of the human race. Investigations, especially in recent decades, among widely different savage nations have established the fact that all primitive music rests upon the pentatonic scale. It is not merely a coincidence, therefore, that the oldest musical systems of the civilized nations of antiquity likewise are built upon this pentatonic scale of five whole tones, which became heptatonic through the addition of two semitones only when a nation had reached a certain degree of culture. For primitive musical systems, see the special articles on ARABIAN, CELTIC, CHINESE, EGYPTIAN, FINNISH, FOLK, GREEK, HEBREW, HINDU, INDIAN, JAPANESE, MAGYAR, SCOTCH, SLAVONIC MUSIC; MODES; PLAIN CHANT.

It is impossible to tell with certainty when and by whom a second voice, moving in another interval than the octave, was first introduced. Huchald (q.v.), the foremost theoretical writer of the tenth century, describes the beginning of harmony as the simultaneous progression of two parts in parallel fifths, known as *organum*. In the next century Guido of Arezzo (q.v.) substituted fourths for the fifths, and this innovation soon led to the employment of the remaining intervals. When after several thousand years music had progressed so far, it had at last found its true material, which is not the single tone and its melodic progression, but the chord and its harmonic progression.

I Old French School (c.1100-1350)—The principal merits of this school are the invention of the *faux-bourdon* (a progression of voices in sixths and thirds) and the *discant* (contrary motion of voices). This contrary motion led to counterpoint, and this again to the establishment of a system of notation in which the different values of the notes in regard to time were definitely fixed. (See MEASURABLE MUSIC.) After a *discant* was once set in contrary motion to a *cantus firmus* composers soon conceived the idea of adding a third and even a fourth voice. But the masters of the Old French school did not stop here; they succeeded also in imparting complete independence to the individual voices. Three art forms were developed—the *motet*, *rondeau* (rondeau), and *conductus* (conduit). In all these forms are found well-defined passages of writing which to-day we call canon and imitation. The prominent mas-

ters are Leonin, Perotin, De Garlande, Franco of Paris, De Vitry, De Machault, De Muris.

II Gallo-Belgic School (c.1350-1500)—The masters of this school began to feel the emptiness of consecutive fourths and fifths, and so used sixths and thirds more freely. Greater attention was given to the leading of the voices, and technique made great strides. Occasionally the compositions rise above the level of mere technicality. The principal masters are De Zeelandia, Faugues, Dufay, Binchois, Busnois, Regis.

III School of the Netherlands (c.1450-1600)—This school divides itself into four distinct periods: 1. Okeghem developed the art of canonic writing to such an extent that it became merely ingenious trickery. Instead of unified forms, the works of this school present a conglomeration of detached details. Okeghem's successors were Hobrecht, Tinctor, Jannequin, Brumel, Compère. 2 The leader of the second period is Josquin Desprès, a pupil of Okeghem. He and his contemporaries strove to make their skill subservient to artistic purposes by emphasizing the symmetry of form and by paying attention to the development of their themes. The leading composers are, besides Desprès, Agricola and Mouton. 3 The extreme artificiality of the two preceding periods led to a reaction in favor of a more simple and natural style. The masters started from Josquin's principle of symmetry. They also developed the purity of harmonic writing and insisted upon definite melodic phrases. Several of them carried this style to Italy, where they became the founders of new schools. These composers were Gombert, Willaert, Goudimel, Arcadelt, Van Rore. 4. The fourth period shows the influences which the Italian schools had begun to exert over the mother school. Whereas the importance of earlier schools rests entirely upon the vocal works, the fourth period marks the rise of instrumental music (organ) in the works of Sweelinck, who practically became the founder of the famous school of the North German organists. The whole school of the Netherlands reached its culmination in the works of Orlando di Lasso, a master scarcely inferior to the great Palestrina. The great musicians of this period are Sweelinck, Lasso, Di Monte, Pevernage.

IV Old English School (c.1220-1600)—1 England possesses the oldest-known specimen of polyphonic writing, the famous canon "Sumer is icumen in." As long as the school of the Netherlands was regarded as the oldest, this manuscript puzzled musical historians. Coussemaker in 1865 proved the existence of the still older French school (I), and so this canon is now assigned to the year 1226. During the fifteenth century a school showing the same general characteristics as the Old French school must have existed in England, if we may judge from a few preserved compositions by John of Dunstable, Power, and Benet. 2 The reign of Henry VIII witnessed a considerable musical activity, but no new style was created. The representative composers, Redford, Johnson, Merbecke, and Tye, show the influence of the school of the Netherlands. 3 These men really prepared the way for the next generation, when the style of the school of Venice predominated. Of this period numerous large choral works and madrigals have been preserved. The chief composers are Farrant, Tallis, Byrd, Gibbons.

V School of Venice (1527-1612)—Williaert

brought the musical art of the Netherlands to Venice, where he settled in 1527. Under the influence of the more impressionable Italian musicians he gradually acquired a new style. In the style of the Netherlands each voice was practically independent, and its relation to a definite chord was not strongly pronounced. The Venetian masters established the chord as their basis, and, instead of simultaneous progressions of voices, we find, rather, progressions of chords. The independence of the separate voices was restricted, but not abolished. The custom of writing for a double chorus was introduced, the madrigal was perfected, and for the first time vocal works with instrumental accompaniment appear. The great composers of this school are Willaert, A. Gabrieli, Van Rore, Zarhino, Merulo, Donati, G. Gabrieli.

VI *School of Rome* (1535-1674).—Italy owes it to this school that she once was regarded as the most musical nation. While the Venetian school regarded the chord as a basis, and gained their effects largely by means of modulation, the Roman masters restored greater freedom to the individual voices and subordinated technique to art. The introduction of secular themes into sacred works had led to serious abuses, but the Roman masters, especially Palestrina, proved that the contrapuntal style is not antagonistic to the dignity proper to Church music. To the Roman school also belongs the honor of having originated the oratorio (Carissimi) and a distinct instrumental style (Frescobaldi). Merulo in Venice had done much to develop the *tocatta*, but not until Frescobaldi appeared did instrumental music become entirely free from the influence of vocal music. The greatest masters are Ferrabosco, Festa, Annunziata, Palestrina, Nanini, Anerio, Allegri, Frescobaldi, Carissimi.

VII *Spanish School* (1540-1608).—Spain at no time succeeded in establishing an original school. During the sixteenth century several Spanish composers lived in Rome, and returning to their native land, carried with them the art of the Roman school, so that in reality the Spanish school forms only a part of the Roman school. The most prominent Spanish masters are Da Vittoria and Morales. The Portuguese composer A. Goes shows the influence of Gombert, which can be accounted for by the fact that this Flemish musician spent some years in Spain.

VIII *German Polyphonic School* (1500-1625).—This school divides itself into two periods, the former showing Flemish, the latter Venetian, influences, but in the frequent and bold use of dissonances the German masters go beyond their predecessors. The chief composers showing Flemish influences are Isaak, Heinrich Finck, Senff, Hermann Finck. Those showing Italian influences (almost all pupils of G. Gabrieli) are Gallus, Gumpeltzhaimer, Hasler, Aichinger, Prätorius.

IX. *School of Protestant Church Music* (1540-1672).—1. In Germany, the Reformation popularized Church music by the introduction of congregational singing. For untrained voices, simple music was needed, and this need gave rise to the *chorale*, which originated in the singing of sacred words to popular folk songs. The musicians whose importance rests chiefly upon their chorales are Luther, Walther, Eccard, Calvisius, Franck, Schein. 2. From the earliest times it had been customary in the Catholic church to recite during Holy Week the Passion

of Our Lord according to the Gospels. Luther desired to preserve this custom for the Reformed church. He translated the text and had various composers furnish the music. Thus arose the *passion*, to the cultivation of which many German masters devoted their best energies. Along this line vocal polyphonic music steadily developed until, in the works of Schütz, German music reached an originality that places it on a level with the famous Italian schools. The German school combines the beauty of the Roman school with the massiveness of the Venetian. In addition, there are a tenderness and a subjective, passionate element quite distinct from the colorless solemnity of the early Italian music. The important masters are Schütz, J. C. Bach, J. M. Bach.

X. *School of German Organists* (1620-1722).

—1. While vocal music was steadily advancing, instrumental music, although of later date, was not neglected. Sweelinck had founded a great school in the Netherlands, which trained many Germans, who carried the art into their native land. There the cities of Hamburg and Lübeck became the centres of a new instrumental school whose basis was the *chorale*. The principal forms cultivated were the *tocatta*, *ciaccona*, *fugue*, and, towards the end of the period, the *sonata*. The great North German masters were Scheidt, Scheidemann, Reinken, Buxtehude, Kuhnau. 2. While the North German masters developed the style of Sweelinck, a group of composers in the middle and south of Germany worked along similar lines, but under the influences of Frescobaldi and the Roman school. The authority of the Italian sonata writers had by this time extended to Germany, and the forms of the *sonata da chiesa* and the *sonata da camera* were cultivated. Nor was the fugue neglected. All the great composers used the Italian forms, but infused their own individuality into them, and thus prepared the way for J. S. Bach, who wrested the leadership in musical affairs from Italy and transferred it to Germany. The German masters who aided in this great work are Kerl, Froberger, Pachelbel, Muffat, Biber.

XI *School of Florence* (1594-1676).—While the earlier Italian composers cultivated almost exclusively the polyphonic style of vocal music, a school with widely different tendencies sprang up in Florence. The revival of the learning of Greece led to an attempt to reconstruct the ancient drama. Thus arose the monodic style, in which one voice sings while instruments furnish the accompaniment. In 1594 Peri set an entire drama, *Dafne*, to music in this manner. Crude as the attempt was, it found favor, and in less than half a century the new style had conquered all Europe. Its development was not confined to Florence; in fact, its greatest exponent, Monteverde, was a native of Cremona, although he lived chiefly in Mantua and Venice. But, as the style originated in Florence, it seems advisable to classify all composers identified with its development under the Florentine school. This school first dispensed with the preparation of dissonances, and greatly developed the orchestra, establishing the strings as its foundation. The works of this school were first designated by the title *dramma per musica*. About 1650 we find *opera per musica*, which soon afterward became simply *opera*. The principal names of this division are Peri, Caccini, Monteverde, Cavalli. See OPERA.

XII *School of Naples* (1675-1757).—As

early as 1475 a Flemish master, Tinctor, settled in Naples, but not until 200 years later did a distinct school arise. From Rome and Venice the Neapolitans adopted the polyphonic Church style, from Rome the oratorio, and from Florence the musical drama. The new school paid more attention to the melodic outline of the highest voice, perfected the form of the *aria* (q.v.), and introduced it into their dramatic works. Whereas the Florentine musical drama consisted of continuous recitative by a single voice, the Neapolitans introduced not only the *aria*, but also choruses, duets, trios, etc. The Florentines had emphasized the *dramatic*, the Neapolitans emphasized the *musical* element. They also cultivated the form of the concert overture. (See OVERTURE.) Transferring the form of the *sonata da chiesa* to compositions for the clavichord, and introducing a secondary against a principal subject, they prepared the way for the modern sonata. The principal masters are Stradella, A. Scarlatti, Durante, Logginscino, Leo, D. Scarlatti.

XIII *Early French Opera* (1645-1764) — After the Old French school had been supplanted by that of the Netherlands we have no more records of music in France until 1645, when a work of the Florentine monodic style was produced in Paris. The rise of the French drama through the works of Corneille, Racine, and Molière turned the general attention to the stage. Lully became the founder of a distinct school of French opera. The characteristics of this school are better dramatic characterization and the raising of the chorus to an active participation in the dramatic development. The orchestra also is increased by the addition of kettledrums and trumpets, and the character of the wood wind is recognized. The important names are Cambert, Lully, Marais, Rameau.

XIV *Later School of Venice* (1650-1739) — The German Protestant masters had introduced a subjective and emotional element into their Church music. This became the keynote of the later Venetian masters. A distinctive feature is the development of some particular theme which begins in a low register and gradually rises higher and higher, leading to an effective climax. The growth of the orchestra also gave the composers an opportunity to heighten the effect of their vocal polyphonic works. The chief masters of this school are Legrenzi, Lotti, Caldara, Marcello.

XV *English Music during the Restoration* (1660-94) — After the death of Gibbons in 1625 music declined rapidly in England. This decline was due to the unsettled state of affairs during the reign of Charles I and the fanaticism of the Puritans, who objected to the cultivation of music and destroyed many valuable manuscripts. When, at his accession in 1660, Charles II attempted a restoration of music, practically a new start had to be made. In spite of many drawbacks, however, music soon attained its former importance. Purcell, the greatest musical genius England has ever produced, now appeared, and under his inspiration English music rose to such a height that for a short time England boasted a national school of opera. The principal composers of the Restoration are Humfrey, Wise, Blow, Purcell.

XVI *Italian Sonatists* (1620-1800). — Up to the seventeenth century the organ was the great means of developing instrumental music (toccata, ricercare, fugue). By the beginning of

that century the violin had been considerably perfected and attracted a number of musicians in northern Italy. These composers prepared the way for our highest musical art form, the sonata. About 1650 a distinction began to be made between *sonata da chiesa* and *sonata da camera*; the former consisted of several movements of contrapuntal writing, the latter employed various dance forms. Great attention was paid to thematic development. The instrumental concerto was introduced and the *concerto grosso* was cultivated. The principle of musical dualism, first announced by Scarlatti, was strongly emphasized. While in the eighteenth century all the art forms in Italy declined, this school of sonata writers was the only one that made progress in the art. The principal masters are Legrenzi, Bassani, Torelli, Veracini, Corelli, Tartini, Boccherini.

XVII *German Singspiel* (c 1630-1800) — 1. In the beginning of the seventeenth century there arose in Germany the so-called school comedy—dramatic representations by students. Each act was preceded by a short musical dialogue introducing mythological personages. This custom led to the establishment of the German *singspiel* (q.v.), in which the acting personages were shepherds, shepherdesses, nymphs, etc. These *singspiele* finally gave rise to a national German opera in Hamburg, but not until Hiller in Leipzig established the *singspiel* upon the basis of the folk song did this form rise to an artistic level. The composers of this form are Strunck, Kusser, Keiser, Mattheson, Handel, Telemann, Hiller, Dittersdorf, Schenck, Weigl, Winter. 2. While the *singspiel* was popular with the masses, the German princes, decrying everything that was German, favored the Italian opera. Especially Vienna and Dresden became strongholds of the foreign style. Many German composers began to write Italian operas, and thus aided the rapid decline of dramatic composition. Among these composers we find Hasse, Graun, Doles, Naumann. See OPERA.

XVIII *Decadence of Italian Opera* (c 1750-1810) — With the *aria* the Neapolitan school had given to music that form which was soon to bring about a general decline of dramatic music. Dramatic truth counted for nothing, sensuous charm of melody and display of vocal art were paramount. Composers became the slaves of singers. The ballet became an important factor in the opera. Naturally composers did not waste time in studying counterpoint and polyphonic writing when success was so easily won by writing pretty melodies over the plainest harmonic accompaniment. The principal names of this period are Porpora, Pergolesi, Jommelli, Piccini, Sacchini, Paisiello, Salieri, Cimarosa, Zingarelli, Righini, Paer. See OPERA.

XIX *Mannheim Symphonists* — About the year 1740 a remarkable change of style is noticeable. Polyphony (q.v.) gave place to homophony (q.v.). While in their chamber music the Italian sonatists assigned to the first violin a leading part, to which all other instruments were very much subordinated, a group of German composers, mostly residents of Mannheim, took up the sonata form (q.v.), but by treating all instruments polyphonically made them participate in the thematic development. By emphasizing the second subject and making it participate in the general development as much as the principal subject, they created musical

dualism as a principle of the new style. Thus these masters originated the modern sonata and symphony and established the foundations of the modern orchestra. Above all these composers towers Johann Stamitz (qv), whose symphonies and chamber music strike a decidedly individual note and prove the new form capable of far greater freedom than the older forms of the severe contrapuntal art. Strange to say, for more than a century the work done by these Mannheim composers had been buried in oblivion, until early in the twentieth century Dr. Hugo Riemann discovered and republished these works, which are indispensable as the natural connecting link between the Italian sonatists and the great German classic masters. The most important composers of this group are, next to Johann Stamitz, his two sons Karl and Anton, F. X. Richter, Holzhauser, Schobert, Toeschi, Cannabich, J. C. Bach, Malder, Fraenzl, Beck, Eichner.

XX The *Classic Masters* (c 1700-1827) — BACH marks the culmination of the polyphonic period of music (see POLYPHONY), as well as the beginning of the new homophonic-harmonic period (see HOMOPHONY). In him the *passion* (qv) and the *instrumental fugue* reach their highest development. He brings equal temperament (qv) into universal use. HANDEL brings the *oratorio* (qv) and the *vocal fugue* to perfection. Taking up English music where the premature death of Purcell had left it, he gives a new impetus to English music. GLUCK reforms the opera by emphasizing the dramatic in opposition to the purely musical element, without, however, disturbing the forms of the aria, chorus, duet, ensemble, etc. He greatly advances the art of orchestration. HAYDN takes up the new instrumental style of the Mannheim symphonists, perfecting the sonata form and considerably advancing the art of orchestration. MOZART invents no new forms, but fills those existing with the contents of his wonderful genius. He is a universalist, equally great in all the forms he handles. In the works of BEETHOVEN absolute music reaches a point which would indicate the highest possible development, beyond which no progress can be imagined. He greatly enlarges the forms of Haydn and Mozart, and replaces the *minuet* (qv) of the symphony by the *scherzo* (qv). He strikes passionate accents never heard before in music, and discloses marvelous depths of emotion. SCHUBERT creates the art song (*kunstlied*). (See LIED.) In the field of instrumental music he follows the path opened by Beethoven, but preserves his own strong individuality. See the separate articles.

XXI *English Music since Handel* (1750-1829) — When Handel settled in England in 1718 the national opera of Purcell had been entirely superseded by the Italian. Handel's own Italian operas exerted no uplifting influence, and have shared the fate of the works by his contemporaries. But when Handel began to cultivate the oratorio he laid the foundation of his fame, which shed lustre on contemporary English music. Unfortunately, he remained the only master. His contemporaries and immediate successors were unable to carry on his work, although they made earnest efforts. They therefore turned their attention to the opera—not the foreign Italian product but the national English opera. They even succeeded in establishing a style of their own different from the

German *singspiel* or the French *opéra comique*. The spoken dialogue occupied altogether too much space, and, although the musical numbers were not lacking in a certain freshness and melodious charm, they were utterly devoid of all dramatic expression. Hence this national opera died with its authors. The most prominent composers are Arne, Arnold, Dibdin, Storace, Hook, Shield.

XXII *Italian Opera Buffa* (c 1730-1816). — The short intermezzi (qv), which originally were interpolated between the acts of the *opera seria*, were gradually expanded and finally completely separated from the serious work. While the *opera seria* treated tragic subjects of mythology, this new *opera buffa* treated comic situations drawn from everyday life. Logroscino (qv) may be regarded as the founder of this type. He also established the elaborate ensemble at the close of each act, which soon was also adopted by the serious composers. The first work of this kind which created a European sensation was Pergolesi's *La Serva Padrona* (1734), the last and unsurpassed masterpiece, Rossini's *Il Barbiere di Siviglia* (1816). In our own day the *opera buffa* has been successfully revised by Wolf-Ferrari (qv) with his *Il Segreto di Suzanna* (1911), *Le Donne Curiose* (1912), and *Amore Medico* (1913). Several of the masters of the *opera seria* also excelled in this lighter kind. The principal names are, besides those mentioned, Leo, Hasse, Cimarosa, Paisiello, Piccini, Jommelli, Mozart.

XXIII *French Opéra Comique* (c 1760-1870). — This school presents three sharply marked periods. The productions of the first period somewhat resemble the German *singspiel*. The subjects are taken from everyday life or fairy tales. The secco-recitative of the Italian *opera buffa* gives place to the spoken dialogue, for the aria is substituted the French *chanson*. The works of the second period (c 1800-30) show the influence of German romanticism. The purely comic subjects are replaced by a mixture of comedy and romanticism. The music assumes a more serious character, and better musical characterization is attained. The orchestra becomes an important factor, and the ensemble is strongly influenced by that of the *grand opéra*. In fact, some of the masters of the *grand opéra* belong equally to the *opéra comique* (Cherubini, Auber, Halévy). In the works of the third period we find very often that the only comical thing about them is their designation as *opéra comique*. Composers do not hesitate to choose tragic subjects. And yet such works are called *opéra comique*, because they differ from *grand opéra* by the fact that there is spoken dialogue. Nothing can very well be more tragic than Bizet's *Carmen*. But it contains spoken dialogue, hence it is *opéra comique*. In *opéra comique* there is generally a healthier musical atmosphere, less striving for mere effect, more truthful dramatic expression, less artificiality. The great masters of this school are Philidor, Monsigny, Grétry, Cherubini, Méhul, Isouard, Auber, Boieldieu, Hérold, Halévy, A. Thomas.

XXIV *French Grand Opéra* (1774-1864) — A peculiarity of the French opera is the fact that several of the masters who have contributed most materially to its advancement were foreign born. After the death of Rameau French national opera was at a standstill, and for some time the Italian opera gained ground. Then a

German, Gluck, appeared with his reforms. The success of his *Iphigénie en Aulide* in 1774 marks the beginning of a new era of French opera. The new style was taken up by two Italians, Cherubini and Spontini, who finally established the *grand opéra*. Then native French composers began to take part. The characteristics of this school are the prevalence of tragic subjects; the absence of spoken dialogue, the great attention paid to declamation, which very often degenerates into empty rhetoric and hollow pathos; a heavy orchestration, whose aim is for striking effects; and elaborate ensembles and finales. The introduction of a ballet after the second act is indispensable. In the choice of subjects those taken from history are specially favored. This school may be divided into two periods, roughly separated by the year 1830. The characteristics just mentioned apply more strictly to the second period (Meyerbeer); while the works of the first period, as a rule, are marked by a greater earnestness of purpose as far as the purely musical setting is concerned. The principal composers are: Gluck, Berton, Gossec, Cherubini, Lesueur, Spontini, Auber, Rossini (*Tell*), Meyerbeer, Halévy. See OPERA.

XXV *Italian Bel Canto* (1813-68) — We have seen that the opera in Italy declined rapidly after the middle of the eighteenth century. With the appearance of Rossini a new school may be said to begin. Even before him singing was the chief attraction, but his predecessors relied upon the technical skill of the singers to please the audience. Rossini surpassed all Italian operatic composers before him in the charm of melodic invention. It is this sensuous charm of melody that distinguishes the school of the *bel canto* from the school of decadence. Besides Rossini, the principal exponents of this style are Donizetti and Bellini. Of only secondary importance are Generali, Mercadante, and Pacini.

XXVI *German Romanticists* (1818-80) — The German romantic opera was developed from the *singspiel*. About the middle of the eighteenth century witches, gnomes, ghosts, and all kinds of spirits were introduced into the *singspiel*, which thus gradually gave rise to a new kind, the *zauberoper* (magic opera). Although the texts of these productions were silly, and the attention was distracted from the purely musical element to the scenic decorations, yet this *zauberoper* led opera into the realm of the mysterious, fantastic, and wonderful, where it has scored its greatest triumphs. The real beginning of the Romantic school is marked by the appearance of Weber's *Freischütz* (1818). With the appearance of romanticism music becomes more and more the individual, subjective expression of each composer, so that it is exceedingly difficult to arrange composers into groups. One characteristic of the Romantic school in general is the great advance in orchestral tone coloring over the classic masters and a decided preference for dissonances. Not only do the different instruments become so many separate voices, but a distinction is made even between the various registers of the same instrument. Harmony becomes greatly enriched and is the principal means of emotional expression, while rhythm assumes greater diversity and complexity. Music in general becomes more intense and passionate. The instrumental composers at first fill the classical forms with romantic contents, and then originate new

forms. In the field of dramatic music the principal composers are Weber, Spohr, Marschner, Lortzing, Holstein, Nicolai, Flotow, Kretschmer, Goldmark, Götze, Nessler, Brüll. Those who devoted their energies to instrumental and choral works are Spohr, Schumann, Mendelssohn. The latter master has much in common with the classicists, and became the head of a school whose principal representatives are Hiller, Reinecke, Jadassohn, Hauptmann, Richter, Moscheles. The influence of Schumann is perceptible in another group of masters, of whom the most prominent are Franz, Volkmann, Jensen, Huber, Heller. Midway between these two schools, and preserving characteristics of their own, are Raff, Rheinberger, Wüllner, Klughardt.

XXVII *German Lied* (1815-) The one form which was originated and brought to highest perfection by German masters is the *lied*. So specifically is it a product of German genius that other nations who have adopted the form have never attempted to translate the name into their own language. Long before Schubert German composers had written songs, frequently in conscious imitation of the simple folk song. But even Mozart, Beethoven, and Weber failed to recognize the possibilities of raising the song to the level of a high art form. In his very first lyrics Schubert surpassed all predecessors. In his short life he composed over 600 poems expressing the entire gamut of human emotions, thus proving the universality of his genius, and pouring out a profusion of divine melody. Successive masters enriched the piano part, until Hugo Wolf (q.v.), by transferring the principles of Wagner's music drama to the *lied*, endowed the instrumental portion with truly symphonic power. In Germany, at least, there is scarcely one composer of prominence since Schubert who has not cultivated the *lied* more or less. The fame of Robert Franz and Hugo Wolf rests entirely upon their imperishable masterpieces in this field. The masters who have materially contributed to the development of this form are Schubert, Schumann, Franz, Brahms, Mendelssohn, Liszt, Rubinstein, Grieg, Tschaiakowsky, Jensen, Cornelius, Wolf, Strauss.

XXVIII *Wagner, Liszt, Brahms* (1843-87). — Among the great German masters of the nineteenth century three stand forth so prominently that it is impossible to classify them. Wagner and Liszt became founders of two distinct schools, whereas Brahms stands alone, without followers. Wagner began as the successor of the romantic opera of Weber. His reformatory work is concerned, not with the opera in particular, but with dramatic composition in general. He emphasizes the drama and asserts that music must only follow and intensify the text. He considerably curtails the introduction of the chorus, ensembles, etc. The voices declaim in a highly dramatic kind of recitative, while the development of the musical ideas is assigned to the orchestra. The unifying principle of his works is the *leitmotiv* (q.v.), which constitutes the basis of the *musical drama* (q.v.). The music drama is a combination of the dramatic, musical, and plastic arts into one new art form. Wagner demands first of all a *drama*, not a text or libretto (q.v.), all the resources of music are to be employed towards a true interpretation of this drama; and the plastic arts are to combine with music. The orchestra is enormously enriched by new *tone*

colors and means of expression (See MELOS; OPERA; WAGNER.) Liszt applied Wagner's principle of descriptive music to purely instrumental music and became one of the founders of modern programme music (q.v.). Unable to make the classic form of the symphony serve his purpose, he invented the *symphony poem*. In the field of piano music he becomes the originator, with Schumann and Chopin, of modern piano-forte technique. Together with Wagner and Berlioz he also laid the foundations of a new school of conducting (the interpretative conductor) (See CONDUCTOR; LISZT.) Brahms, in an age of musical excitement and innovations, stands forth as the keeper of classical forms. He successfully carries on the style of Beethoven's third period, faithfully preserving the form, but showing the possibility of filling it with new and original contents. Thus he proves that absolute music is unlimited in its scope and power of expression, that its capabilities were not exhausted even by the titanic Beethoven; that any original genius can employ those forms for conveying his ideas, that the polyphonic art of Bach can successfully be combined with the homophonic-harmonic art of Beethoven and with romanticism. See BRAHMS.

XXXIX. *Berlin Academicians* (1830-1900).—While Brahms was not hostile to the development of music, a number of composers refused to recognize that romanticism was an advance in the art of music. They closed themselves to the new influences and sought their ideals in the past. The strongholds of this school were several Berlin institutions, notably the Singakademie (See CHORAL SOCIETIES.) The energies of these masters were directed to the cultivation of the polyphonic style of the older Italian schools and Bach. But some of the later masters finally adopted the principles of romanticism. The important names are Dehn, Grell, Kiel, Baigiel, Blumner, Becker, Bruch, Hofmann, Herzogenberg, Gernsheim, Moszkowski, P. Scharwenka, X. Scharwenka, Goldschmidt.

XXX Neo-German School (1847-) —The beginning of Liszt's activity in Weimar in 1847 may be regarded as the commencement of this school. Liszt attracted a great number of young musicians who enthusiastically devoted themselves to the cultivation of programme music, carrying out Liszt's ideas. But the Neo-German masters did not devote their energies entirely to the field of instrumental music. Wagner's works attracted more and more admirers, and composers began to imitate him. Up to the present day a great many dramatic works constructed upon Wagner's principles have been written. The failure of all would seem to indicate that one might almost be justified in stating that Wagner's art form is one suited to his own gigantic genius, but hopeless for lesser masters. This would seem to be confirmed by the fact that the new dramatic works that have achieved success are all by non-German composers who adopted many of Wagner's ideas, but not his form in toto. The Neo-German school has been marked by earnest effort, but its composers have made no lasting impression. The only one whose work seems destined to outlive contemporary criticism is Richard Strauss, a man of pronounced originality, who in the art of orchestration has advanced even beyond Wagner. The dramatic composers of this school are Cornelius, Ritter,

Bungert, Kistler, Humperdinck, Kienzl, D'Ai-
bert, Weingartner, Schillings, S. Wagner, R.
Strauss, Blech, Reznicek, Urspruch, Pfitzner.
The instrumental composers are represented by
Krug, Nicodé, Mahler, Hausegger, Boche, Reger,
Scheinpflug, Korngold, R. Strauss.

XXXI *Modern Italy* (1851-).—Beginning about 1750 the history of Italian music is practically the history of the decline of the opera. When Verdi scored his first success in 1839 no one dreamt that this man, beginning in the degenerate style, would raise the Italian opera to a high level. In *Rigoletto* (1851) there is a very perceptible effort for dramatic truth and characterization, which the school of *bel canto* entirely ignored. The successive works advance along this line until in *Aida* (1872) we have a rare combination of exquisite melody, dramatic characterization, and truth of expression. *Otello* (1887), and *Falstaff* (1893) mark the culmination of Italian opera. Wagner's principle of dramatic truth is strictly observed. Nevertheless these works are not imitations of Wagner. Verdi has retained all the forms of the opera, but has knit them together into an artistic whole. The principle of the leitmotiv is not used. The orchestration shows a mastery never exhibited by any previous Italian composer. The influence of Verdi is noticeable in a number of composers known as the *Veristic* school (Mascagni, Leoncavallo), who for some years attracted much attention. Among the many operatic composers, none of whom can approach Verdi, the following deserve mention: Boito, Ponchielli, Marchetti, Faccio, Coronaro, Puccini, Smareglia, Giordano, Montemezzi, Wolf-Ferrari, Zandonai, Catalani. The elevating influence Verdi exerted upon dramatic music turned some serious composers to the field of instrumental and choral music, which had been sadly neglected in Italy. The principal instrumental and choral composers are Pinelli, Sgambati, Cesi, Grazzini, Mancinelli, Martucci, Franchetti, Perosi, Singaglia.

XXXII *Modern France* (1830-) —So far we have spoken of musical development in France only in connection with the theatre. Instrumental music had not been cultivated to a very great extent. But we cannot disregard the name of the family of Couperin during the seventeenth and eighteenth centuries. Several members have become famous through their contribution to the perfection of the suite form. Under section XXIV the history of dramatic music up to the death of Meyerbeer has been given. Berlioz first awakened a deeper interest in instrumental music. This master was led to instrumental composition through the influence of Beethoven, but, uninspired by the classic forms, he became the originator of programme music (q.v.). His works, all conceived in large forms, lack symmetry of construction and have not yet found universal recognition. But Berlioz first aroused general interest in France for instrumental music and, independently of Wagner, did much for the art of orchestration. Soon other composers began to cultivate instrumental music; and these used the classical forms. After Berlioz's ideas of programme music had been adopted by Liszt, who established the symphonic poem as a recognized art form, French composers accepted the idea. All through the past century German classical and romantic influences have been at work in France. The mingling of these in-

fluences with the individuality of the French masters has been productive of excellent results, and to-day France can boast an influential instrumental school. The principal masters are David, Franck, Lalo, Saint-Saëns, Bizet, Delibes, Godard, D'Indy, Chausson, Hahn, Guilmant, Pierné, Ropartz, Schmitt, Ravel, Dukas, Fauré, Debussy. But dramatic music did not remain at a standstill, the German romantic opera and lyric drama influenced French dramatic composers. Although the grand opera (the historic and heroic opera of Meyerbeer) was in danger of losing sight of dramatic truth in its striving after mere effect, the *opéra comique* and the later lyrical French drama are distinguished for truth of expression and successful musical characterization. Wagner's works have exerted only a wholesome influence, for French composers wisely did not imitate his form, but only followed the German master in the art of orchestration, as well as in a few other principles which can be safely adopted without danger of losing individuality. The most prominent dramatic composers are Gounod, Saint-Saëns, Bizet, Massenet, Chabrier, Guiraud, Reyer, Massé, Bruneau, Charpentier, Messager.

XXXIII. *Poland* (1830-).—The Slavic and Scandinavian nations took no important part in the development of music until the last century (For a complete account the reader is referred to the articles on SCANDINAVIAN MUSIC and SLAVONIC MUSIC.) Polish music is chiefly represented by the works of Chopin, who is one of the founders of a new school of piano playing. His original harmonic combinations have become a great means in modern emotional expression. He also showed how embellishments can be made an important factor of expression. The other Polish masters show less national characteristics, and those living at present in Germany are more German than Polish. The principal Polish masters are Moniuszko, Kurpinski, Dobrzynski, X and P Scharwenka, Moszkowski, Zelenski, Noskowski, Karłowicz.

XXXIV. *Russia* (1830-).—The beginning of a distinct school may be dated from the first performance of Glinka's *Life for the Czar*. At first the national school cultivated chiefly dramatic composition, but soon composers turned also to instrumental music, in which line several have achieved marked success. The characteristics of Russian music are strength and great variety of rhythm, amounting almost to irregularity. The prominent masters are Bortnianski, Verstowski, Glinka, Dargomyzhski, Serov, Borodin, Cui, Balakirev, Mussorgski, Tchaikowsky, Rimski-Korsakov, Arenski, Glazunov, Rubinstein, Rachmaninov, Glière, Scriabine, Taneiev, Tcherépnin, Rebikov. See SLAVONIC MUSIC.

XXXV. *Scandinavia* (1840-).—Like the Russians, the Scandinavians established a distinct school by emphasizing the national element in music as it was presented in their folk music. Denmark made the beginning, but Norway soon took the lead. The characteristics of the school are an artistic use of dissonances and an emphasis of rhythm as well as melody. The principal masters are: Denmark—Berggren, Hartmann, Gade, Enna, Neilsen, Schiøler, Børresen; Sweden—Hallström, Södermann, Hallén, Sjögren, Stenhammar, Peterson-Berger, Alfvén, Aulin; Norway—Kjerulf, Svendsen,

Nordraak, Grieg, Sinding, Hamerick, Cleve, Schjelderup. See SCANDINAVIAN MUSIC.

XXXVI. *Finland* (1850-).—The beginnings of national Finnish music form a connecting link between the music of Scandinavia and Russia. The original folk music, brought into contact with German classicism, romanticism, and Wagnerism, soon yielded a typical national art music, quite distinct from that of Scandinavia, Russia, or Germany. Its development has been unusually rapid, and to-day Finland is almost the only country where impressionism has not arrested the natural progress of the national art. The important masters are Pacius, Wegelius, Sibelius, Kajanus, Järnefelt, Merikanto, Mielck, Melartin. See FINNISH MUSIC.

XXXVII. *Bohemia* (1860-).—The attempts of Russian composers to establish a national opera led Bohemian musicians to make the same experiment in their own country. A distinct Bohemian school may be said to begin with Smetana's *The Bartered Bride* (1866). Smetana also was the first notable instrumental master. He and, still more, Dvořák have made the Bohemian school famous, but the merit of the instrumental works overbalances that of the dramatic compositions. The forms cultivated are those of the German classic and romantic masters. The principal composers are Skraup, Skuhersky, Schebor, Rozkosny, Smetana, Dvořák, Fibich, Hřmaly, Albest, Weiss, Novak, Suk, Nedbal. See SLAVONIC MUSIC.

XXXVIII. *The Netherlands* (c 1800-).—Although after the time of the great contrapuntal schools of the fifteenth and sixteenth centuries we meet no distinct school in the Netherlands, music was not neglected in those countries. But the influences of the neighboring countries, France and, especially, Germany, always predominated, thus preventing the rise of a national school. Both Belgium and Holland have produced a number of excellent composers. But the importance of the Netherlands during the nineteenth century rests more upon the contributions to musical history. In this line Belgian writers are second to none in the world. Without the labors of Fétis, Coussemaker, and Gevaert our knowledge of the musical past would be very incomplete. Besides, Belgium has produced some of the greatest instrumental performers (De Bériot, Vieuxtemps, Léonard, Servais, Ysaye). The more prominent of the composers are Belgium—Janssens, Benoit, Mertens, Wouters, Van den Eeden, Tincl, Mathieu, Gilson, Blockx, Dupuis, Holland—Verhulst, Koning, Coenen, Silas, Hol, Thooft, De Hartog.

XXXIX. *Modern Spain* (1890-).—Whereas in all other countries the influence of Wagner reacted unfavorably upon composers, this very influence proved a blessing in the case of Spain, because it effectively checked the strong Italian influences which had prevailed for three centuries and suppressed all originality. Fortunately Wagner was not blindly imitated; his influence acted more in the nature of a powerful stimulus. Operatic composers did not abandon national subjects nor the characteristics of their national folk melodies, but infused more seriousness into their work and strove for higher ideals. In the field of instrumental composition, however, almost all contemporary composers have adopted rather openly the idiom of the French impressionists.

The more important names are Bretón y Hernández, Chapi, Pedrell, Albeniz, Granados, Manén. See SPANISH MUSIC.

XL. *Modern England* (1830-)—The predominance of spoken dialogue had caused the downfall of the English opera. About 1830 some English composers attempted to write national operas with a moderate amount of dialogue. The works of Weber assisted them in their efforts, but, as these earlier works were of a lighter character, English opera soon assumed the character of operetta. The appearance of Sullivan established this form upon a firm basis. In the field of grand opera England has as yet produced no successful work. The cultivation of instrumental music, through the influence of Beethoven, has yielded more satisfactory results, but the best work has been accomplished in the field of choral music. The modern English composers have not succeeded in developing a characteristic style, but their works show solid workmanship and mastery of form. The weak point is thematic invention; the themes lack spontaneity. The list of English composers is a very long one. The following deserve special mention: dramatic music—Bishop, Balfe, Barnett, Macfarren, Wallace, Benedict, Sullivan, Stanford, instrumental and choral music—Costa, Bennett, Barnby, Stainer, Parry, Cowen, Mackenzie, Coleridge-Taylor, Elgar, German, MacCunn, Holbrook, Bantock, Grainger.

XLI. *United States* (1880-)—We have seen that the English School of the Restoration (XV) was obliged to rebuild what the Puritans had destroyed. Music beginning in America with the Puritan psalm tunes and under Puritan influence naturally could not develop. Its growth came only with foreign influences; and even then considerable time had to elapse before any works by American composers appeared. About the middle of the eighteenth century operatic performances of foreign works (chiefly English) began to be given, and before the end of the century crude attempts at original composition in the smaller forms can be chronicled. Not until early in the nineteenth century performances of better operas and larger vocal and instrumental works had resulted in a certain degree of musical culture, did any native composers attempt some of the larger forms. Naturally all these early efforts show no trace of originality. Among the more prominent of these pioneers—all born before 1850—may be mentioned Fry, Bristow, Paine, Pratt, Millard, Penfield, Buck. The work of their immediate successors, though still lacking the strong individual note, and showing largely German influence, is of vastly better quality and occasionally rises to the level of distinction. The principal composers of the latter half of the nineteenth century are Chadwick, Foote, Whiting, Bird, E. Nevin, Bartlett, Shelley, B. O. Klem, Gleason, Kaun. Far above them towers MacDowell (q.v.), a man of striking individuality. Withal, it would be difficult to point out in his works anything specifically American. In order to produce typically American music two ways have been tried—the introduction of Indian themes and of negro melodies. Neither method has yielded the desired result; for neither the Indian nor the negro represents the American nation of to-day. The national music of all European nations has been reared on the immense store of their

respective national folk melodies, accumulated for centuries; and not until there exists a similar abundance of typical American folk melodies will the American composer have the necessary basis for a national music which shall be characteristic of the American nation of some future day. Since the beginning of the present century French influence has gradually been superseding the German, and the majority of the younger composers, in spite of all experimenting with Indian and negro melodies, follow in the wake of the Impressionists. Among the more prominent of the composers of the present day are Herbert, Parker, Stillman-Kelley, Loeffler, Hadley, Saar, Strube, Busch, Converse, A. Nevin, Stock, Brockway, Cadman, Stojowski, Humiston, Mrs. Beach.

TWENTIETH-CENTURY TENDENCIES (1900-)

At no time in the history of any art does the end of a century coincide exactly with the close of a period of artistic activity, and all boundary lines drawn around certain art periods are more or less arbitrary and invariably overlap. Most tendencies in the music of the present day have their beginnings in the last century, but have developed or assumed definite shape within the present century. It is, then, chiefly as a matter of convenience that the year 1900 is taken as a dividing line.

After the death of Wagner and the universal recognition of his genius his influence during the last two decades of the nineteenth century dominated not only dramatic composition but every form of music, without, however, producing much of value. When the composers realized the futility of their efforts in this direction they cast about for something new. "Originality at any cost" became the watchword. Beethoven, Chopin, and Wagner, men of extraordinary inventive power, made sure that they stood upon the solid foundation laid by their great predecessors before they struck out along the new paths which inner necessity impelled them to follow. They never lost sight of the fundamental principles. To-day the case is just the reverse. Composers whose chief shortcoming is lack of thematic invention disregard fundamentals and seize upon accidentals, which are emphasized out of all proportion to their intrinsic value or importance. Thus their harmonic system is founded, not upon the eternal basis of consonance, but upon dissonance. Excessive modulation has practically obliterated tonality. The remarkable advance in orchestral technic, instead of being a blessing, is really a curse, since it originated in a desire to hide insignificant musical ideas under a dazzling exterior. Pure music is no longer written for art's sake, but to express something or other. This frantic striving for "expression" has resulted in deadly monotony, for the constant employment of strange harmonies and an enormous technical apparatus make climaxes and contrasts impossible. Twentieth-century music addresses itself to the nerves, that of the preceding century to the heart.

This modern tendency is known as impressionism. It originated in France during the last century, and for some time its principal and practically only exponent was D'Indy. (See INDY.) The great success of Debussy (q.v.) at the beginning of the present century led composers, irrespective of nationality, to adopt

this new idiom. Just as Wagnerism had done before, so now impressionism has leveled all distinctions as to nationality and individuality. Although each belongs to a different nation, Samazeuilh, Scriabine, Albeniz, Szymanowski, Scott, Loeffler, Rangstrom, all are Impressionists, all write the same idiom, and a work by any one might as well have been the work of any other member of the group. Whereas with Debussy this language is natural and free from the excesses of the imitators, it soon became a caricature, especially among the younger Russian and English composers. They not only force music beyond its natural sphere, but they attempt to establish a fancied relation between music, colors, and odors. From this extreme impressionism it is but a step to the futurism of Marinetti, Pratella, and Ornstein. Their fundamental axiom, that all music of the past must be swept away completely to clear the ground for an entirely new beginning, sufficiently characterizes their tendencies to exclude serious discussion.

But aside from the predominance of impressionism, there are in almost every country minor talents producing meritorious works. They are lacking, however, in strength and individuality to overcome the prevailing fashion. The following are the principal names among the Impressionists: Schönberg, Fried (Germany), Debussy, D'Indy, Dukas, Roger-Ducasse, Ropartz, Ravel, Samazeuilh, Schmitt (France), Casella (Italy); Scriabine, Rebikov, Stravinski (Russia), Szymanowski, Szeluta (Poland), Albeniz (Spain); Bantock, Holbrook, Scott (England), Loeffler (United States).

MUSIC, MILITARY. See BAND, MILITARY.

MUSIC, PSYCHOLOGY OF. The psychology of music deals with the mental processes which furnish both the motives for its production and the ground of its appreciation. It has an individual and a social aspect; for music as an art involves not only the individual conscious-

ness, as such, but also, since it is a means of expression and communication, the modification of one mind by another. See MUSIC.

The mental elements primarily involved in music are sensations of tone. Of the 10,000 tones which may be distinguished in consciousness, music uses a comparatively small number. Our own elaborate musical system includes only 85 or 90, ranging from about 40 to 4000 vibrations per second—something less than seven octaves. The simple tonal sensation is produced by an uncompounded pendular vibration of the air. The note (compound tone or simple clang) is composed of a number of simple sensations, called partials or partial tones, one of which (the lowest) is the fundamental, the others are called overtones. The character (timbre, clang tint, quality) of the note is determined by the number and relative intensity of the various partials. (See CLANG TINT, EXPLANATION OF.) Every simple tone has several aspects or attributes—pitch (high or low); intensity (loud or soft); duration (long or short); tonality (the octave relation, every c or d of the scale is, in a sense, a repetition of every other c or d); volume (large or small). By the combination and variation of these attributes, although some are more important than others, all classes and forms of music are produced. There is, first of all, the combination of qualities and intensities in the note or compound tone, which is the practical basis of music. Above this stand the alternations of intensity, which produce rhythm (q.v.); the successive rise and fall of pitch, which forms the essence of melody, and the synchronous combination of pitches (see FUSION), known as harmony. The attribute of tonality has doubtless played a part, along with fusion, in determining the limits of scales and in the development of form. These, however, are only the materials: the psychological problem is, first, to inquire into the specific manner in which they are employed, and, secondly, to discover the motives and the nature of the psychological processes which gave rise to the production of music. Our primary task, therefore, is the analysis of music itself; and since our own music has developed not only in a high degree but also in a single direction, we must study other musical systems as well. Research of this kind has been made possible in recent years by the collection of phonographic records of exotic music from all parts of the world. The largest and most representative series (more than 5000 phonograms) is housed in the psychological laboratory of the University of Berlin, where under the direction of Stumpf the work of transcription and comparison is steadily going forward. Enough has already been done to afford some insight into the principal factors which determined the origin and development of music.

The starting point is to be found in the innate tendency to give expression to feelings and ideas by bodily movements. (See EXPRESSION, EXPRESSIVE MOVEMENTS.) When expressive movements are used with intent to communicate, language appears first in the form of gesture (q.v.) and later in that of vocal utterance. It is not, then, until sound becomes a medium of communication that we may expect the step which leads directly to the origin of music. Vocal utterance could not in itself have given rise to an art of music; for many insects, birds,

and most of the higher vertebrates below man produce sounds without exhibiting the slightest evidence of an intent to employ them in the sense in which we speak of music as an art. An examination of the earliest forms of music reveals the fact that primitive man had somehow recognized a fairly constant relation between tones, and upon this relation his music was based. No hypothesis of the origin of music, therefore, which fails to take account of this fact can be satisfactory. Darwin's theory that music arose by way of sexual selection, Spencer's theory that it began with the cadences of speech, and Buecher's theory that it developed out of the natural tendency to produce sounds while working in rhythm, are accordingly all at fault. This basal relation, however, is of two kinds—consonant interval and tonal distance. They are alike in that both are differences between the pitch of tones, they differ in that the former are recognized and felt as such, may be reproduced independently of any fixed pitch, and are as a consequence readily transposed, while the latter are approximately equal steps from a principal tone, as if distance were successively added to distance. All *primitive* music is based, apparently, on the one or the other of these relations, although there is one instance at least, the Malu music of Murray Island, where both appear to have been recognized independently. Stumpf derives the perception of consonant intervals from vocal signals or calls which demand the production of a fixed and relatively high tone more musical in character than the indeterminate pitch of ordinary speech. If the calls are given in concert by men, women, and children, whose voices vary by octaves, fourths, and fifths, we have, in Stumpf's view, the optimal conditions for the recognition of these particular intervals, to which smaller intervals are later added. However that may be, the evidence goes to show that these three intervals do in fact furnish the basis of many primitive melodies. A characteristic example is found in the Sarawak music of Borneo, which appears to be based upon the descending fourth, within this interval one tone frequently appears, and occasionally a second tone, while the interval itself furnishes the framework of the melody. Fifth and octave, however, are also employed.

How the principle of tonal distance came to be discovered we can only guess—perhaps from a playful manipulation of the vocal apparatus, perhaps from the rhythmical intonation of words in an approximate monotone, such as occurs in the ceremonies of certain American Indians. At any rate, melodies of this type seem to be the oldest form of primitive music, and the purest in the sense that they have taken shape without the aid of musical instruments. In one instance, that of the Veddas of Ceylon, the successive tones rise and fall about a principal note. If, as frequently happens, the entire melody consists of two or three notes of different pitch, the principal tone is the lowest, if, however, the range covers four or five tones, the principal tone is the last but one. The tones are further grouped into small phrases or motives, which are repeated with slight variations. The Malu music of Murray Island, mentioned above as a case in which both tonal

distance and consonant intervals appear, seems originally to have been of the distance type. In the earlier forms the melodies consist of short rhythmic phrases which descend by approximately whole tones until a low pitch is attained, when a return is made to the pitch at which the melody began and the entire melody is repeated. In later forms the octave is found either as a descending *portamento* at the end of the melody or as a rise when the low point of the melody is reached. The fifth seems to enter solely through confusion with the octave. Still later these intervals are employed more freely, as consonants in melody that is otherwise based on tonal distance. We have finally to consider a form of exotic music, not primitive but highly sophisticated, which may have been derived either from tonal distance or from consonant interval. The Javan and Siamese scales are formed by dividing the octave into equal steps; in the former there are five, in the latter seven intervals. Since the intervals are equal, these isotonic scales may be regarded as artificial examples of tonal distance, but since the consonant octave forms the starting point for the mathematical division, and the fourths and fifths are impure, they may also be regarded as degenerate forms of a music originally based on consonance. The latter hypothesis seems the more probable.

When we compare the two fundamental forms of melody, the one based on interval, the other on tonal distance, with regard to their inherent possibilities of development into music like our own, the former is decidedly superior. It is true that in the Vedda melodies we find a principal note which suggests the keynote of Occidental music, and the recurrence of phrase or motive which has played so important a part in the general development of musical form, but these are also found in Sarawak music. Moreover, the employment of consonant intervals not only permits of ready transposition, which results in a greater freedom of outline, but also makes possible a true polyphony and the ultimate acquisition of harmony. The development of music, therefore, when taken as a whole, seems to have been largely conditioned upon the discovery of, and the feeling for, consonant intervals. We have now to seek for the motives which furthered its growth and the characteristics which marked its progress. The chief motive is to be found in the religious ceremonies of primitive society. The dance, which was an important feature of the ceremonies, was accompanied by the voice and by at least one musical instrument, the drum. We may expect it, therefore, to impress its rhythm upon the gradually developing melodies.

Melodies themselves, however, are conditioned upon the organization of successive tones into unitary groups or wholes; for melodies are not constructed of successive sounds with determinate pitch relations, the sounds are bracketed together into a motive with a recognized individuality, much as a number of articulate sounds combine to form a word which seems to be simple and unitary. And just as a poem is built with words, so is a melody constructed of motives. At first these motives are quite short and are repeated over and over again, as in the following phrase of the aborigines of

Australia Next there is a slight variation of the motive in repetition, and the new form may again be repeated many times, perhaps with a final return to the original form. Then the motive is transposed a fourth or a fifth in the repetition. Gradually the number of repetitions becomes less and the variation more frequent. The nature of variation, in exotic music, is often exceedingly complex, whereas in our own system it is usually limited to the direction of the tonal movement and to the rhythm, in exotic music it includes minute changes in pitch, in stress, and in the method of attacking the notes. Furthermore, exotic music shows form qualities which belong not to the motives but to the melodies taken as wholes. The characteristic of Malu music, where there is a general downward tendency of the melody, is an early instance of melody form; but in some cases the melody forms are so subtle as to be almost indiscernible to our ears, thus, the Ragas of India are melody forms of such intricacy that, although a native singer is able to say in what Raga his song is composed, the European can scarcely distinguish one Raga from another.

The rhythm of exotic music, because of its purely melodic character, has also developed in a manner foreign to that of our music. The reason is that concerted singing and playing, with attention directed to the harmonic effect, tend to force the music into two-part or three-part rhythms, while the more free melodic forms have permitted a rhythmic development of great complexity. Thus, in exotic music, not only are five-part and seven-part rhythms common, but combinations of these with two-part or three-part rhythms are also not infrequent. It often happens, too, that a melody produces one rhythm while the drum which accompanies it plays another and a different rhythm; cases are even reported in which several rhythms are played simultaneously. Rhythmic forms are also known, the Talas of India stand to rhythm as the Ragas to melody. Those of a simpler type consist of short rhythmic motives, played on drums, which may be repeated or otherwise developed in much the same way as the melodic motive. The melodic and rhythmic forms seem to mark the end of the development of pure melody or homophony. Further development follows, apparently, from the combination of melodies, which eventually leads to harmony.

While, as has been said, true harmony is not found in exotic music, we yet observe phenomena which seem to represent its first beginnings. There are numerous instances of organum, i.e., of the singing of melodies in parallel octaves, fourths and fifths, in some cases (the Solomon Islands) even in parallel thirds, sixths, and seconds. Examples are also found of bourdon, or vocal organ point, in which a single tone is sustained throughout the melody, either above or below, or, if there are two additional voices, the one above and the other below. Or again there may be an alternation of two or more notes in rhythmic figures, much as in our *ostinato* or ground bass. There are also cases, found throughout the Far East and also in the Sudan, to which Stumpf has given the name of heterophony—cases in which one instrument plays a melody while the other members of the orchestra play more or less free variations of the theme, a practice which is thought to have been common in old Greek music. Finally,

there are evidences of a nearer approach to our polyphony, when several different melodies are sung simultaneously but only occasionally come into unison or consonance. Since polyphony has played so important a part in our own musical history, and since our feeling for harmony is the product only of the last few centuries, it seems reasonable to suppose that the rude polyphony of exotic music is a link connecting it with Occidental music. The chief characteristics of our system have already been pointed out—the supreme importance of the keynote or tonic, the relative simplicity of rhythm, and the dominance of harmony over melody. It may be added that in the harmonic structure of sonata form, with its modulation from the tonic to the key of the dominant, followed by the free excursion into other keys, with a subsequent return to the tonic, we find a harmony form which is comparable to the melody forms and the rhythm forms of exotic music.

The important steps in the development of music thus seem to be (1) the perception of tonal distance and of consonant interval, (2) the organization of the tonal material either about a principal note or in motives; (3) the further organization of the motives into a melody; (4) the combination of melodies with regard to consonance, and (5) the development of harmony. When we attempt to describe the psychological motives and processes which underlie the whole complicated structure, we must be content, in the light of our present knowledge, with broad generalizations. Throughout the entire development of music we have the underlying fundamental tendency to give expression to feelings and ideas. With this as the basis the first two steps follow as a result of the universal determining tendency to discriminate, to organize discrete elements into wholes and to give them meaning. Musical meaning, however, is not an intellectual meaning, in the sense that it can be put into words, it is the affective, æsthetic, and empathic response which the organism makes to tonal stimuli, and it is carried by the group of organic and kinæsthetic sensations, plus whatever imagery there may be, which accrues to a tonal experience. The third step follows again from the preceding, but now the feeling to be expressed is particularized, the composer has something to say and may have a more or less conscious plan for saying it, he is guided at every point by emotional reaction, by æsthetic judgment, by the logic of his art. This set of principles then gives rise to the fourth and fifth stages of development; the composers who produced our music a few centuries ago found consonance more pleasing, more beautiful, and more logically satisfying than anything melody could give; and our system is the result.

The conditions of the appreciation of music are the same as those of its production, with the difference that the listener interprets a meaning which the composer has sought to express. But the elements of which music is made are so numerous, and the dispositions which the listener brings to the hearing are so varied, that differences in appreciation may be very considerable, both as between individuals and in the same individual at different times. The auditor who brings to the hearing a sufficient culture finds his greatest pleasure in the unfolding of the work of art, in apprehending the

development of the musical idea, perhaps also in appreciation of the composer's skill in the handling of his materials, or in the adequacy of the performance. Another type of auditor, or even the former in certain moods, bathes in the flood of feelings and emotions which are directly aroused by the music. A third type finds its chief enjoyment in the motor reactions set up by the rhythm of the music, in this case the rhythmical element alone makes a strong appeal. Finally, there is a type that finds in music a stimulus to the imagination, whose principal pleasure lies in reverie, in dreaming day dreams. These types, however, are neither rigid nor permanent, a shift of attitude towards the performance brings a change in the mode of enjoyment. The universal enjoyment of music is due to its manifold nature and to the corresponding multiplicity of its appeal.

MUSICAL ART SOCIETY. See CHORAL SOCIETIES.

MUSICAL DICTATION. A branch of musical training of very recent date. The instructor sings or plays short musical selections or phrases which the pupil is required to fix in musical notation on paper. The object of musical dictation is not only to train the ear, but chiefly to develop the power of quickly grasping and fixing musical ideas. The beginning is made, of course, with simple melodies progressing in simple intervals. Gradually melodies with more difficult intervals are introduced. The next step is to melodies with a simple harmonic basis. A class for musical dictation was established at the Conservatory in Paris in 1871. Some of the German conservatories soon followed (Hamburg, Dresden, Karlsruhe, etc.). Consult Albert Lavignac, *Cours complet de dictée musicale* (Paris, 1882); H. Gotze, *Musikalische Schreibübungen* (Breslau, 1882); F. L. Ritter, *Musical Dictation* (London, 1886); Hugo Riemann, *Katechismus des Musikdiktats* (Leipzig, 1889).

MUSICAL DRAMA, or MUSIKDRAMA. A term now generally employed to distinguish the later works of Wagner (*Tristan und Isolde*, *Die Meistersinger*, *Die Nibelungen*, *Parsifal*) from his earlier ones, or operas (*Rienzi*, *Der fliegende Holländer*, *Tannhäuser*, *Lohengrin*). Of a musico-dramatic work Wagner demands that the literary drama be the first and music the second consideration, whereas in the opera the

music was almost the sole consideration. In his introduction to *Oper und Drama* Wagner declares emphatically: "The error in the art form of the opera consisted in the fact that a means of expression (music) was made the end; the end of expression (the drama) a means." After *Lohengrin* Wagner wrote chiefly theoretical works dealing with the method to be followed by the poet and composer in the production of a new form of art which was to take the place of the opera. Several years elapsed before he began the composition of *Die Nibelungen*, according to his new artistic convictions. In the musical drama the fundamental material from which the music is constructed is the *leading motive*. (See LEITMOTIV.) By this means artistic unity is obtained, whereas in the opera the different numbers may be artistic wholes, but can never be welded intimately together into the higher unity of the entire drama. Wagner's musical dramas have exerted a powerful and lasting influence upon all dramatic composers. For full information, the reader is referred to Wagner's *Oper und Drama*, vols. III-IV of his *Gesammelte Schriften und Dichtungen* (Leipzig, 1887). See also MELOS, OPERA. WAGNER.

MUSICAL FESTIVAL. The performance of some large choral or orchestral work with a very large chorus or orchestra. The real era of musical festivals begins with the festival performances of the great Handel Commemoration held in London from 1784 to 1787 and again in 1791. It is true that previous to this time regular musical festivals were held in England, but they were practically unknown on the Continent. In England choral singing had always been more extensively cultivated than in any other European country, and the efficiency of English choirs led Handel to turn his attention in the direction of writing for large choral bodies in his oratorios. Since the first performance of *The Messiah* in 1749 it has remained a custom in London to perform that work with greatly augmented chorus and orchestra every year at Christmas. These performances on a grand scale in the English capital roused a feeling of national pride in the Germans, who felt that the great master belonged to them by birth. Festival performances of Handel's oratorios were first given in Berlin on the London plan and were imitated in other German cities. Soon the works of other composers were performed in a similar manner. And as on such occasions there was always a large orchestra, it was but natural that this body of instrumentalists was utilized in the performance of large orchestral works. Thus, at the beginning of the nineteenth century several organizations devoting their energies to the production of any great work, whether choral or purely instrumental, sprang into existence in various parts of Germany. Among these the oldest and even to-day most famous are the Gesellschaft der Musikfreunde in Vienna and the Niederrheinische Musikfeste, which take place yearly in some city of the lower Rhine district. The United States has not been behind in following the example of England and Germany, and many festivals are held yearly in several of the larger cities. On such occasions it is nothing unusual to find a chorus numbering from 1000 to 2000 voices and an orchestra of from 100 to 200 performers. These musical festivals have also powerfully affected the mode

of conducting and have done very much towards establishing the universal custom of conducting by means of the bâton. Whereas formerly the conductor always presided at the piano, the handling of large bodies of singers and players necessitated the undivided attention of the conductor upon those whom he directed, and the singers, in turn, became likewise more dependent upon signs and gestures from the conductor. See CHORAL SOCIETIES, CONDUCTOR, and for an account of the principal musical festivals, see BAYREUTH MUSICAL FESTIVAL, BETHLEHEM MUSICAL FESTIVAL, CINCINNATI MUSICAL FESTIVAL; GESELLSCHAFT DER OESTERREICHISCHEN MUSIKFREUNDE; GEWANDHAUS-CONCERTS; LEEDS MUSICAL FESTIVAL, LOWER RHENISH MUSICAL FESTIVAL; SACRED HARMONIC SOCIETY; SALZBURG FESTIVAL, SOCIÉTÉ DES CONCERTS DU CONSERVATOIRE; SONS OF THE CLERGY, TONKUNSTLER-SOCIÉTÁT, THREE CHOIRS FESTIVAL; WORCESTER FESTIVAL.

MUSICAL GUILDS. See GUILD.

MUSICAL INSTRUMENTS. The origin of many musical instruments dates back to the earliest times. Not a few of these ancient instruments are the prototypes of some of our modern ones. Monuments recently unearthed at Thebes and in the upper valley of the Nile contain representations of harps and flutes, and the relation of our modern instruments to the old Egyptian models is not difficult to perceive. In the case of other instruments the relationship is not so easy to trace, owing to the considerable modifications which they underwent in the course of centuries and in passing from one nation to another. Even so recent an instrument as our grand pianoforte can be traced through its many and vital changes to the dulcimer (q.v.), known to the Arabs and Persians. Hand in hand with the evolution of the art of music went the invention and perfection of musical instruments. Many of these were extensively used and admired in their day, but soon were superseded, so that to-day our museums are filled with various instruments of all times and nations preserved only as curiosities. Thus the large family of lutes is now entirely obsolete; and yet at one time these instruments enjoyed the same popularity as the pianoforte does to-day, and no orchestra was complete without them. If we except the stringed instruments, it may safely be asserted that no instrument found in the modern orchestra is the same as it was a century ago. All the instruments of the wood-wind family have been vastly improved; the natural horns and trumpets have given way to the improved valve horns and trumpets; the serpents and ophicleides have been entirely superseded by the trombones and tubas. It may be said that the modern orchestra comprises the best and most efficient instruments now known, and the test for admission into this select family is sonority and beauty of sound. Musical instruments are generally divided into four large groups, according to the manner in which the sound is produced, viz.: (1) stringed instruments, (2) wind instruments, (3) instruments of percussion, (4) keyed instruments. This latter group embraces the organ and pianoforte, the former being really a wind, the latter a stringed instrument. Both organ and piano differ from the other instruments of those groups in the use of a keyboard.

Stringed Instruments. Stringed instruments are divided into two principal classes:

(a) those in which the tone is produced by drawing a bow made of horsehair across the strings, (b) those in which the tone is produced by plucking the string either with the fingers or a small instrument called *plectrum*. The instruments of class (a) have but few strings (generally four), and depend for the production of their complete range upon stopping, i.e., shortening the vibrating portion of the string by means of the fingers. To this class belong (1) the violin, (2) the viola, (3) the violoncello, (4) the double bass (qq.v.). Some of the instruments of class (b) have few strings like those of class (a); others have a separate string for each note. Those having few strings are: (1) the mandolin, (2) the guitar, (3) the banjo. Those having many separate strings, (1) the zither, (2) the harp (qq.v.). Formerly there were in use instruments that were played with a bow, which also had additional strings to be plucked with the fingers. (See THEORBO) Among the stringed instruments by far the most important are those constituting the viol family, class (a). The present perfection of these instruments is the result of a slow evolution of possibly a thousand years. But so far we have no evidence whatever that any instruments of the viol family were known in antiquity. Because Arabic authors of the fourteenth century mention stringed instruments, it was supposed for some time that viols originated in the Orient. This has been disproved by Gerbert, who in the second volume of his *Musica Sacra* published a representation of a European stringed *lyra* of the ninth century very similar in shape to the later *giga*. Even earlier, however, the crowd (q.v.) was known in Wales. For several centuries viols were built in two shapes—either with a flat body like the violin or with a pear-shaped body like the mandolin. During the fifteenth and sixteenth centuries stringed instruments of all possible varieties of shapes were built. These, however, were all superseded in the course of the following two centuries, when the art of violin making reached its height. After the violin had been perfected the same attention was also bestowed upon the instruments of lower pitch of this family, such as the bratsche, viola da gamba, viola d'amore, etc. (See VIOLIN, VIOLONCELLO) A full account of how the viol family came to be the foundation of the modern orchestra will be found under ORCHESTRA.

Wind Instruments. Under this heading are included all instruments on which the tone is produced by setting a column of air in motion. According to the material from which they are made, they are subdivided into (a) wood-wind instruments, (b) brass instruments. Many of the wind class are transposing instruments, i.e., the tones actually produced upon them are not the same as those written for them. Let us take the clarinet family as an example. The compass of the clarinet in C is from *e* to *c'*. It is possible to obtain notes below and above this range by building clarinets in different keys. Thus the clarinet in A produces the same series of tones a minor third lower, so that the lowest tone is *c♯* and the highest *a'*. The clarinet in E \flat produces the tones a minor third higher, so that its lowest tone is *g* and its highest *eb'*. Hence the music for any transposing instrument must be written in a key *above* or *below* the key of the composition by the same interval as the key of the instrument is *below* or *above* C.

MUSICAL INSTRUMENTS

- | | | | |
|----------------|-------------------|----------------|-------------|
| 1. ÆOLIAN HARP | 4. CROWD or CRWTH | 7. COR ANGLAIS | 10. REBEC |
| 2. THEORBO | 5. HURDY-GURDY | 8. BARYTON | 11. SHOPHAR |
| 3. LUTE | 6. ALPENHORN | 9. MONOCHORD | 12. LYRE |

From the Crosby Brown Collection in the Metropolitan Museum of Art, New York

For instance, a piece is written in A \flat major and the composer desires to employ the E \flat clarinet. Since every tone sounds a minor third higher than the written note, it is necessary to write this particular clarinet part in a key lying a minor third below A \flat , i.e., in F. See TRANSPOSING INSTRUMENTS.

a The Wood Wind—The instruments belonging to this class are generally made of wood, but ivory is also used, and quite recently flutes have been made of silver. The instruments of the wood-wind family are: (1) the flute, (2) the piccolo (a small flute with very shrill tones), (3) the oboe, (4) the English horn, (5) the heckelphone, (6) the clarinet, (7) the bassoon, (8) the double or contra bassoon, (9) the saxophone, (10) the sarrusophone, (11) the flageolet (qq.v.) This last instrument was extensively employed by Gluck and Mozart, but is now obsolete. Of the wood-wind instruments the English horn, the clarinet, the saxophone, and the sarrusophone are transposing instruments, as was also the flageolet. All the wood-wind instruments have a rich, mellow tone approaching that of the human voice more closely than any other instruments.

b The Brass—The members of this class consist of (1) the horn, (2) the cornet, (3) the trumpet, (4) the trombone, (5) the tuba, (6) the euphonium, (7) the serpent (qq.v.) The two last named are obsolete. With the exception of the trombone, all these instruments are transposing instruments. The tones produced by brass instruments are distinguished as *natural* and *harmonic* tones. The former are produced upon the open tube by regulating the force of the air current by means of the lips, the successive tones produced are the harmonics or overtones of the fundamental. (See HARMONICS.) All tones produced by the aid of the valves are called *harmonic tones*. In the case of the trombone the length of the vibrating air column is regulated not by valves but by a slide. Formerly the horns and trumpets had no valves, and these instruments are to-day called *natural* horns and trumpets. To produce a complete scale on them it was necessary to insert the left hand in the opening. They have now been entirely superseded by the valve horns and trumpets. The trumpets must have undergone considerable change since the days of Bach and Handel, for in the works of these masters we find passages written for trumpets which no one can execute to-day. All the brass instruments are built in many keys, so that it is easily possible to write four-part harmony for only one group of brass instruments. For instance, in the case of trombones there are four varieties—the alto, tenor, bass, and double-bass trombone. The latest additions to the family of brass instruments are the tubas, which Wagner had constructed especially for his *Ring des Nibelungen*. See TUBA.

Instruments of Percussion. The instruments of percussion may be divided into two principal classes: (a) those which have definite pitch, (b) those which have not. The former class comprises: (1) the kettledrums, (2) the glockenspiel, (3) the xylophone, (4) the celesta. The latter class includes: (1) the bass drum, (2) the small drums, (3) the tambourine, (4) the tamtam, (5) the cymbals, (6) the triangle, (7) the castanets (qq.v.). The chief use of instruments of percussion is for marking the rhythm. Those instruments that are devoid of

definite pitch are capable only of rhythmic figures; whereas the glockenspiel and xylophone can play melodic figures as well. Of all the instruments of percussion the kettledrums are the most important and most generally used.

For description of the keyed instruments (*pianoforte* and *organ*), the reader is referred to the extensive special articles.

Under the above headings the instruments at present in use in the orchestra have been described in their general features and especially in their relation to other members of the same family. Besides the instruments mentioned, many others have been in use in former times. There are still others in actual use, but as they are not employed for music of a high character, they have not been discussed. The following is a list of instruments of these classes: alpenhorn, bagpipe, basset horn, bugle, cembal d'amore, chimes, clavichord, concertina, crowd, dulcimer, flugelhorn, glass chord, harpsichord, hurdy-gurdy, jew's-harp, kazoo, krummhorn, lur, lute, lyre, ocarina, psaltery, shawm, spinet, theorbo, viol, virginal. Instruments of the nations of antiquity and of Oriental nations are treated in the special articles on the music of those nations.

Besides the instruments employed in musical performances there are a few that are built solely for the purpose of acoustic experiments. These are (1) the monochord, (2) the siren, (3) the tuning fork (qq.v.).

MUSICAL NOTATION. The art of expressing musical compositions in writing by means of certain conventional signs called notes. The oldest system of notation of which we have any knowledge is the *alphabetical notation* of the Greeks. The detailed descriptions of this system left to us enable us to decipher without much difficulty the few remnants of Greek music recently discovered. The Greeks employed uncial letters which appeared in a great variety of positions—inverted, sideways, divided in halves,

etc. Thus no less than 120 different combinations were obtained.

Example 1.

ΑΒΓΔΕΖΗΘΙ
\\./·N TΛE≡Υ

Long after the downfall of Greece this system of notation remained in use, especially in the writings of the theorists. During the sixth century A.D. Roman letters were first used. Boëthius employed the first 15 letters of the alphabet, but these were later reduced to seven and applied to the degrees of the scale. These letters—as the Greek letters had also been—were placed in a straight line above the syllables of the words. Although in themselves sufficiently definite, the letters did not present to the eye the rising or falling of the melody, as does our modern notation. This need gave rise, in the eighth century, to a series of dots, hooks, curves, and peculiar figures which were placed above the syllables of the text at distances proportionate to the musical pitch of the note. These characters are known as *neumes* (See NEUMES.) From a combination of the signs of these neumes and the alphabetical notation arose our modern system. But its progress was slow, and the complex system of *mensurable music* (qv) had first to outlive itself before the present simpler system was established.

The Stave. The introduction of lines we owe to the neumes. In the tenth century Hucbald took up the idea of using lines. He wrote the syllables between the lines, and at the beginning he indicated by the letters T and S whether the voice was to proceed by tones or semitones.

Example 2

This, in modern notation, reads

Example 3

By increasing the number of lines Huebald was enabled to write even four-part compositions in this manner. Soon after his time dots were used on *the lines*, leaving the spaces vacant, and the degree of the scale was indicated by a Greek letter placed at the beginning of each line. But the great number of lines necessary rendered the reading of this manner of notation difficult, and it was soon abandoned. Guido of Arezzo in the eleventh century added two black lines to the red and yellow lines of the neumes, in such a manner that the upper black line above the yellow represented E and the second black line, drawn between the yellow and red lines, A.

Example 4.

E	black
C	yellow
A	black
F	red

Whereas before his time only the spaces *or* the lines had been used, Guido made use of both lines *and* spaces. The advantages of this system were so obvious that this stave was soon adopted in every country of Europe. As long as music was homophonous, i.e., consisted of only a single

melody, this stave answered all purposes. But the growth of polyphony soon rendered a greater number of lines and spaces an absolute necessity. No one seems to have thought of the simple idea of writing each voice on a separate stave. Instead the four lines were extended to six, eight, twelve, and even more. In the Paris Library there is a score, dating from the middle of the thirteenth century, in which all the voices are written on a single stave. The difficulty of reading scores written in this manner led musicians to adopt a uniform stave of nine lines arranged in two groups, each containing four black lines. The two groups were separated by a red line. In the fifteenth century we find three staves employed for different kinds of music. Plain-chant melodies were written on a stave of four lines, all other vocal music on a stave of five lines, and a stave of six lines was used for all compositions written for the organ and virginal. After the invention of music printing the five-line stave became the universal standard of all music, except the plain-chant melodies, which to this day are written on a stave of four lines.

The Form of the Notes. As long as music had no distinctive rhythm of its own and the musical accents were determined only by the word accent, Guido's system of using simple dots answered all purposes. But it was not long before the need of notes having a fixed time value made itself felt. Franco of Cologne, in the twelfth century, replaced the dots by notes of various shapes to indicate their relative duration. He also indicated the time value of pauses or rests by a series of signs corresponding in duration to the different notes. A full account of this complicated system will be found under **MEASURABLE MUSIC**. This system has become the foundation of our modern system of notation. The notes of larger value, the *long*, *longa*, and *breve*, have disappeared, the *semibreve* having become our standard of value or *whole* note. The development of instrumental music during the eighteenth century brought with it a great advance in the technique of the instruments, and this led composers to write passages requiring more rapidity of execution than is possible to obtain from choral masses. Round notes were substituted for the square ones, because the former can be written more easily and rapidly. Another important innovation, and one which greatly facilitated the reading of scores, was the joining of all notes having hooks into groups readily recognized by the eye. Thus a passage which formerly was written

Example 5

Whereas formerly the *semifusa* (corresponding to our sixteenth) was the note of smallest value, the increased rapidity rendered possible by instrumental technique led to a subdivision of sixteenths into thirty-seconds, and of these latter even into sixty-fourths. The signs denoting the rests in mensurable music have been adopted into the modern system without modification.

The Clefs. The oldest of the clefs is the F clef, which in its original form as a red line dates back to the tenth century. Almost as old is the C clef, which originally was a yellow line. These colored lines were used without a clef signature, as it was understood that every note upon the red line represented F and every note upon the yellow line C. Later on the colored lines disappeared, black ones being substituted and the letter F or C placed at the beginning. (See NEUMES.) The modern forms of these clefs are the result of a series of modifications of the plain letters.

The G clef is more recent than the other two, but its present form is the result of similar changes of the letter G.

Example 6.

Originally the different clefs had no fixed position as they have to-day. In order to avoid the use of ledger lines (which, in fact, were unknown), the position of the clefs was constantly shifted, so as to bring the range of every voice within the limits of the staff. In old manuscripts we find every clef, at various times, on every line of the staff. Even within the same melody the clef changes frequently. This arbitrary use of the clefs continued until the seventeenth century. The establishment of opera (q v) brought with it the introduction of many new instruments. To bring the range of all these instruments within the limits of the staff could not be accomplished any longer by the transposition of clefs. Previously some polyphonic writers of the sixteenth century had on very rare occasions resorted to the use of a single ledger line above or below the staff. This idea was taken up by the operatic composers, and thus ledger lines became a fixture in music. Now that there was no longer any need for the constant transposition of clefs, the positions of those that remained in use became definitely fixed. Each voice part had its own clef, as also the violin.

Example 7.

In this form the classic masters have used the clefs. For the pianoforte the G and F clefs are used, the higher-pitched orchestral instruments play with the G clef, those of lower pitch the F clef. The viola is the only one for which the alto clef (C) is retained. During the nineteenth century the C clefs were superseded even in vocal music by the G clef.

Time Signatures. Before the introduction of mensurable music there was no need of time signatures. The signatures used in mensurable music will be found in the special article on MENSURABLE MUSIC. When, in the seventeenth century, the bar was introduced, composers soon saw an opportunity for reducing the very complicated and cumbersome time signatures of mensurable music. The underlying principle of rhythmic division into binary and ternary forms still remained the basis. But, whereas in the

older system ternary division (perfect) was the principal consideration and binary division (imperfect) only secondary, the new system inverted these relations by recognizing only binary division as natural. Ternary division was retained, but was regarded only as a modification of the natural binary division and obtained by the use of a dot which increased the value of the note by one-half. Moreover, all notes were referred to the whole note (the semibreve of mensurable music) as the standard of value. Thus, the whole note was divided into two half notes, each half note into two quarters, etc. The time signatures of this new system were expressed by fractions, the denominators indicating the subdivision of the standard whole note and the numerators the number of subdivided notes to be allotted to each measure. The only signs still retained from mensurable music are the semicircle for common time (four quarters in a measure) and the semicircle with a line (alla breve), where the line still has the meaning of reducing the notes to half their duration.

The Bar. The earliest example of the use of vertical bars is found in Agricola's *Musica Instrumentalis*, which was published in 1528. The object of these bars, however, was only to keep the notes of the different voices one under the other, rather than to indicate rhythmic divisions. A few original drafts of older compositions give evidence that composers during actual composition did use bars to indicate the rhythm, although all the part books up to the seventeenth century were printed without bars. The general use of bars we owe to the early composers of operas. Peri, in 1600, published the score of his *Eurydice* exactly as he had written it. In order to indicate clearly the connection between the different notes in the voices and accompanying instruments he drew vertical lines through the whole length of the staff. Caccini and Monteverde adopted this plan. The great facility of reading music printed in this way immediately led to its universal adoption. The new system of music, having established new signatures for time, allotted a certain number of beats to each bar, and in this way the bar became what it is to-day.

Accidentals. In spite of the strict laws governing plain chant and the use of the old Church modes, the human ear from the earliest times felt the need of a leading tone. The tone of the scale that was subject to this modification was B. Thus at a very early time this letter was written in round (b) and later square (b) form to indicate whether the lower or higher tone was to be sung. It is easy to see how from these two forms arose our flat and natural (b). Towards the end of the thirteenth century the sign b was carelessly written ♯, and being applied to other tones than B, denoted the higher of the tones on the same degree. Thus, F♯ denoted the modern F♯, but Fb was the same as our F natural, just as Bb was regarded as the natural tone and B♯ (our B) a chromatic alteration of Bb. As a key signature the sign b appears first in the Church modes, but denoted only a transposition of the original mode. (See MODES.) Even in the eighteenth century a b was used as a sign of resolution for a note having a ♯ or b (these two signs were identical); and vice versa a ♯ or b served to resolve a b. The signs of the double sharp and double flat (×, bb) cannot be traced further back than the

beginning of the eighteenth century. The sign \times arose from writing the older \sharp in this position \times . Before the beginning of the seventeenth century accidental sharps, flats, or signs of resolution appeared very seldom in writing. The singer was supposed to introduce the necessary chromatic alterations during the actual performance. As long as the Church modes reigned supreme no use was made of regular key signatures. A flat or sharp placed at the beginning of a piece denoted only transposition. But as soon as the modern major and minor scales displaced the modes the necessity of key signatures arose, in order to avoid the great number of accidentals.

Expression Marks. Towards the end of the eighth century we find in one old manuscript written in neumes small letters interspersed with the characters of the neumes. These letters refer to the expression. We find a small *f* (*frayor*), *b* or *t* (*benè teneatur* or *teneatur*), *c* (*celeriter*), etc. This manuscript is the famous Antiphonary of St. Gall. The works of the great polyphonic masters of the fifteenth and sixteenth centuries are utterly devoid of any marks of expression, nor are any evidences of expression marks to be found in works written between the eighth and fifteenth centuries. There really was no pressing need for such marks, for all music was vocal, and the text gave a sufficient clew to the singers, who were all thoroughly trained musicians. But the development of instrumental music gave rise to various marks of expression. Hand in hand with the development of instrumental music went the perfection of the musical instruments. Many new effects were discovered, and to express these composers were obliged to use words. Monteverde in his opera *Orfeo* (1608) demands that the trumpets play with mutes, and this is indicated in the score by the words *con sordini*. The same composer introduced a number of new effects in his *Tancredi e Clorinda* (1624), among which were the *tremolo* and the *pizzicato* for strings. Such effects were called for by the actual words placed in the score. These are the earliest instances of expression marks. Operatic composers immediately followed the practice established by Monteverde. Among the earliest of purely instrumental masters who employed words to help the performers was Frescobaldi (1583-1644). He was particularly careful to indicate the tempo. One of his favorite marks is *adagio*. Soon the words *allegro*, *largo*, *grave*, *moderato* came into general use. In the course of the eighteenth century nearly all the important marks of expression and time were in use. The nineteenth century substituted convenient signs for some of the most frequently recurring marks, such as *crescendo* \ll , *diminuendo* \gg , *staccato* . . . , *legato* \smile , *sforzando* \wedge , etc., and increased the vocabulary of musical expression considerably. Some of the German masters of the last century, notably Schumann and Wagner, attempted to substitute a German terminology for the Italian. But the Italian terms are more definite, because two centuries of constant use have familiarized them to musicians of every nationality.

Another system of musical notation used formerly, especially for the lute, is discussed under **TABLETURE**. For the new system of designating chords by figures, used in theoretical treatises, see **NUMERICAL NOTATION**.

Bibliography. A complete history of musical

notation was written by H. Riemann: *Studien zur Geschichte der Notenschrift* (Leipzig, 1878); an abridgment of this is the same author's *Die Entwicklung unserer Notenschrift* (ib., 1881); id., *Geschichte der Musiktheorie im IX.-XIX. Jahrhundert* (ib., 1898); C. F. A. Williams, *The Story of Notation* (London, 1903); Johann Wolf, *Geschichte der Mensuralnotation* (Leipzig, 1904); Guido Gasperini, *Storia della semiografia musicale* (Milan, 1905); A. W. Gehrkens, *Music Notation and Terminology* (New York, 1913). See **GREEK MUSIC**.

MUSICAL SAND. There are a large number of beaches, oftentimes, however, of very small extent, whose sand has the peculiar property of giving out a distinct musical tone when stepped upon. The musical note appears to depend upon the fact that the grains of sand are of such very uniform size that, as they slip past each other under pressure, the vibrations of the particles respectively reinforce each other so that sounds which would otherwise be inaudible become distinct, and the crunching noise which is heard when the foot presses down upon snow or ordinary sand becomes a clear musical note.

MUSIC BOX. A case containing mechanism constructed in such a manner that music can be produced automatically. Machines for making mechanical music have been known since the invention of clocks, but real music boxes were not introduced till after 1750. They have been greatly improved since then, and some modern musical boxes can play over 100 tunes. The mechanism is similar to that of the barrel organ. The principal parts are the comb, the cylinder, and the regulator. Bells, drums, and castanets are frequently added to produce musical effects, and there are occasionally combinations of reeds and pipes. The musical boxes of Prague, Sainte-Lusanne in France, and Geneva, Switzerland, are especially famous.

MUSIC DRAMA. See **MUSICAL DRAMA**.

MUSIC FESTIVAL. See **MUSICAL FESTIVAL**.

MUSIC OF THE SPHERES. See **HARMONY OF THE SPHERES**.

MUSIC RECORDER. See **MELOGRAPH**.

MUSIL, mu'zîl', ALOIS (1868-) An Austrian Orientalist, born at Rychtarov in Moravia. He studied theology at Olmutz and attended the Ecole Biblique of Jerusalem (1895) and the University of St. Joseph at Beirut (1897). He was afterward at various times in London, Cambridge, Berlin, and Constantinople, and became a professor in the University of Vienna. His 11 exploring expeditions in the Holy Land were of particular importance for his investigations of eastern Palestine. In 1910 he claimed that he had identified Mount Sinai. He published valuable maps, based on actual surveys, of Arabia Petraea (1-300,000; 1907), Kuseir 'Amra, and northern Arabia, and wrote: *Arabia Petraea* (1907 et seq.); *Nord-Arabien* (1908-09), *Im nordlichen Hegaz* (1910), *In nord-ost Arabien und Süd Mesopotamien* (1913).

MU'SIMON. See **MOUFLOU**.

MUSIN, mu'zîn', OVIDE (1854-). A Belgian violinist, born at Nandrin, near Liège. He studied at the conservatory of that city under Heynbeig and Léonard, followed the latter to the Paris Conservatory, where in 1868 he won a gold medal, and taught for a year before leaving on his European and American concert tours that ultimately led him around the world. In 1898 he became violin professor at the Liège

Conservatory, but continued to spend much time in the United States. In 1908 he established the Musin Violin School in New York.

MUSK, or **MUSK DEER** (OF., Fr. *musc*, from Lat. *musculus*, from Gk. *μύσχος*, *moschos*, from Ar., Pers. *musk*, musk, from Skt. *muska*, testicle, mouse, from *mus*, to steal). An aberrant deer of the subfamily Moschinae, which differs from ordinary deer in the lack of antlers, in the possession by the male of long upper canines which project downward outside the lips, and in certain anatomical features. Hence there has been much discussion whether the animal should be included in the Cervidae. There is only one species, *Moschus moschiferus*, of the high Himalayas, Tibet, and eastern Siberia—a small animal which stands about 20 inches high and has a clumsy form. Its favorite haunts are the tops of pine-covered mountains, but its summer range extends far above the region of pines. Its habits are nocturnal and solitary, and it is extremely timid. It is much pursued by hunters on account of its odoriferous secretion, which has been known in Europe since the eighth century and is much valued as a perfume.

Musk. This secretion is produced in a glandular pouch situated on the hinder part of the abdomen of the males, and its natural use seems to be that of increasing sexual attractiveness. The musk bag, or pod, is formed by an infolding of a portion of the skin of the belly, within which a number of membranes are contained, and between these membranes are glands by which the musk is secreted. When newly taken from the animal, musk is soft and almost resembles an ointment, it is reddish brown and has an excessively powerful odor. Very little of it reaches Europe unadulterated. Musk is usually imported either in the form of grain musk, i. e. the musk which has been collected chiefly from stones upon which it has been deposited by the animal, in which state it is a coarse powder of a dark-brown color, or in the pod, dried with the musk inside. Of both kinds the annual importations to the United States are about 15,000 ounces, chiefly from China and India. Small quantities are used in medicine, but the greater part is employed by perfumers. The kinds generally known in trade are the Tonquin, or Chinese, and the Carbadine, Kabardine, or Siberian, which is inferior. Genuine musk has the valuable property of adding to the permanency of other odors. On account of its properties as a stimulant and antispasmodic, it is also used to some extent in medicine.

Consult Sir William Flower, a monograph in *Proceedings of the Zoological Society of London* (London, 1875), and Richard Lydekker, *Deer of all Lands* (ib., 1898). See **PERFUMERY**, and **Plate of FALLOW DEER, MUSK, ETC**.

MUSKAT, müs-kät'. A town of Arabia. See **MUSCAT**.

MUSKAU, HERMANN LUDWIG HEINRICH, PRINCE PUCKLER. See **PUCKLER-MUSKAU**, H. L. H.

MUSK DUCK. 1. A very large Australian sea duck (*Bizurra lobata*), which has a musky odor. The male is decidedly bigger than the female and has a lobe of skin depending from its chin. 2. The muscovy duck.

MUSKEGON, müs-ke'gön. A city and the county seat of Muskegon Co., Mich., 40 miles by rail northeast of Grand Rapids and extending 7½ miles along the south shore of Muskegon Lake from Lake Michigan to the mouth of the Muskegon River. It is the largest city and

harbor on the east shore of Lake Michigan, with all-year steamship service to Chicago, Milwaukee, and other ports, and is on the Pere Marquette, the Grand Rapids, and Indiana, the Grand Trunk, and the Grand Rapids, Grand Haven, and Muskegon (interurban) railroads (Map: Michigan, C 5). Much fruit, celery, and garden truck are shipped annually, and the principal manufactured products are furniture and office equipment, pianos, refrigerators, billiard tables, curtain rollers, knit goods, paper, boats, electric cranes, motors, and machined and cast automobile parts. The industries are greatly facilitated by two dams on Muskegon River which develop 75,000 horse power. Resorts in the vicinity attract summer tourists in great number. Through the liberality of Charles H. Hackley the city possesses a fine art gallery, a public library, a hospital, public square, many statues, a gymnasium, and grammar, high, and manual-training schools fully equipped—all maintained through endowments by the donor. Under a charter of 1901 the city is governed by a mayor, elected annually, and a unicameral council. Muskegon Heights, an industrial suburb, and North Muskegon, though closely affiliated with Muskegon, have separate city charters and administrations. The water system, supplied from Lake Michigan, is operated by the city, gas, electric, and street-car systems are privately owned. Jean François Recollet established a trading post here in 1812; Muskegon was incorporated as a village in 1861 and chartered as a city in 1870. During the early eighties it was one of the largest lumber-producing cities in the world, but now has no mills. Pop., 1900, 20,818, 1910, 24,062, 1914 (U S est.), 25,442.

MUSKELLUNGE, müs-ke-lünj. A common variant of maskinonge (q.v.).

MUSKET. See **SMALL ARMS**.

MUSKHOGEAN (müs-kö'gè-an) **STOCK**. A North American Indian stock which derives its name from Muscogee, the principal tribe of the Creek Confederacy (See **CREEKS**.) This is one of the most important linguistic stocks of the United States. It formerly occupied the greater portion of the territory of the Gulf States east of the Mississippi and comprised the Creek, Choctaw, Chickasaw, Seminole, Apalachee, Alabama, Koasati, and Natchez, speaking perhaps five distinct languages, with several minor dialects. The difference was greatest between the Muscogee and the Choctaw proper, of which the Chickasaw was a dialectic form. The Seminole is a mixed dialect, based chiefly upon Hitchitee, the prevailing language of the Lower Creeks, formerly residing on the Chattahoochee River. The old Mobilian trade language was based upon Choctaw.

Their authentic history begins with the first landing of the Spaniards on the Gulf coast under Narváez in 1527. Thirteen years later De Soto traversed their country from east to west, finding the various tribes in practically the same positions which they occupied up to the period of their final removal to Oklahoma. For three centuries their history is closely interwoven with that of colonization and conquest by the Spaniards, French, and English in the Southern States. Each tribe or village made such alliances as suited its purpose, with the exception of the Chickasaw, who, like the Iroquois in the North, remained the steady allies of the English and, by their command of the

waterway of the Mississippi, were able to check the advance of French colonization by cutting off communication between Louisiana and the Illinois settlements. The Apalachee of Florida were Christianized at an early period by the Spanish Franciscans, but the entire tribe was exterminated by the English and their Indian allies about 1702 and the country left an uninhabited wilderness until it was gradually occupied by vagrant bands from the Creek Confederacy, later known as Seminole, or runaways. The Yamasi of South Carolina were driven from their homes in 1715 as a result of a war with the English and retired to Florida. The Muskogean tribes played little part in the French and Indian War, but the Creeks took a particularly active part with the English against the Americans in the Revolution. This warlike confederacy again rose against the neighboring American settlements in the War of 1812 and, by the opening massacre at Fort Mims and the desperate encounters at Talladega and Horse-shoe Bend, made the Creek War one of the bloodiest pages in American history. The two Seminole wars, which cost the government years of effort and over \$40,000,000, further illustrated the fighting temper of the Creek tribes. By these wars and successive treaty sales the Muskogean tribes were rapidly dispossessed until by the year 1835 practically the whole body had been removed to the west of the Mississippi. Here the four principal tribes, the Creek, Choctaw, Chickasaw, and Seminole, re-established themselves as nations under organized governmental forms in Oklahoma, where they now reside.

All the Muskogean tribes were sedentary and agricultural, residing in compact and regular towns and villages, frequently palisaded, and always with a central town house for councils and other public ceremonies, fronting upon a plaza or public square for outdoor gatherings. Their social organization was complex and exact, the rank and duty of each clan being specifically fixed in the tribe. Consult James Adair, *History of the American Indians* (London, 1775), A. S. Gatschet, *Migration Legend of the Creek Indians* (Philadelphia, 1884-88), J. C. Pilling, *Bibliography of the Muskogean Languages* (Washington, 1889), J. R. Swanton, *Indian Tribes of the Lower Mississippi Valley and Adjacent Coast of the Gulf of Mexico* (ib., 1911).

MUSK HYACINTH. A bulbous plant. See GRAPE HYACINTH.

MUSKINGUM, mŭs-kŭp'gŭm. The principal river of eastern Ohio. It is formed at Coshoc-ton by the junction of the Walhonding and Tuscarawas rivers and flows southeastward 112 miles through a rich agricultural region, entering the Ohio River at Marietta (Map: Ohio, G 6). The Ohio and Erie Canal follows its course as far as Zanesville, and slackwater navigation has been secured to Dresden, 92 miles from the mouth of the river.

MUSK MALLOW. A tropical plant. See MALLOW; *HIBISCUS*.

MUSK MELON (so called from its peculiar aromatic flavor), *Cucumis melo*. An annual herbaceous vine of the family Cucurbitaceæ, a native of the warmer parts of Asia and now cultivated in both hemispheres for the sake of its rounded or ovate fruit, which, in its numerous varieties, varies from a few inches to more than a foot in diameter. The rind varies

in appearance and texture, and the flesh may be white, red, green, yellow, or of intermediate colors. The muskmelons commonly grown in North America belong to the subspecies *cantalupensis*, or cantaloupe, and *reticulatus*, or nutmeg or netted melons. The cantaloupes are distinguished by their hard, more or less warty and furrowed rinds. They are usually long-season varieties and are commonly grown in the southern United States. The nutmeg varieties have a softer, more or less netted rind, mature sooner than cantaloupes, and are commonly grown in the more temperate regions of North America. As a special truck crop, however, nutmeg or netted melons are also grown in the South and are commonly but improperly classed as cantaloupes. There are smooth-rinded strains of the nutmeg melon, but fruit of the netted strains which fail to develop the netting are apt to be inferior in quality. Muskmelons require a warm, quick soil. In field culture they are planted—6 to 10 seeds—in hills 4 to 6 feet apart either way. To hasten growth and on poor soils two or three shovelfuls of well-rotted manure are placed under each hill. In the North commercial growers start the plants under glass, preferably in a hot bed, and transplant them to the open field when the weather becomes warm enough. The seedlings are transplanted with difficulty and are therefore usually grown on inverted sods or in pots. Other subspecies of *Cucumis melo* are var *saccharinus*, or pineapple melon, a sweet-fleshed variety, var *flecosus*, or snake melon, 2 to 3 feet long and 1 to 3 inches in diameter, sometimes grown for preserves, but more often as an oddity, var. *chito*, also called orange melon, vegetable orange, garden lemon, vine peach, etc., and used for pickles and preserves, var *inodorus*, a long keeper of poor quality, var *dudaim*, or pomegranate, dudaim, or Queen Anne's pocket melon, a highly perfumed but inedible sort. See PLATE OF CUCUMBER ALLIES.

The striped beetle and flea beetle are serious pests of muskmelons. Spraying with Paris green or dusting with tobacco dust, air-slaked lime, or road dust when the plants are moist helps to keep the insects under control. Land plaster (qv) mixed with kerosene or turpentine is used for the same purpose. The downy mildew and leaf-spot diseases which attack the plant are held in check by applications of Bordeaux mixture. See FUNGICIDE.

MUSKOGEE, mŭs-kŏ'gĕ, or **MUSCOGEE.** A city and the county seat of Muskogee Co., Okla., about 130 miles east-northeast of Oklahoma City, on the Missouri, Kansas, and Texas, the St. Louis and San Francisco, the Midland Valley, and the Missouri, Oklahoma, and Gulf railroads (Map: Oklahoma, F 3). It is the seat of St. Joseph's College (Catholic), the Spaulding Female Institute (Methodist), Oklahoma Woman's College (Methodist), and near by is the Bacone Indian University (Baptist), opened in 1884. The noteworthy features include the new post-office building, costing \$500,000, a splendid high school, Carnegie library, traveling men's club, town and country club, public parks covering 100 acres, fair grounds, and in the vicinity Fort Gibson, and a national cemetery. Among the more important industrial establishments are hardware and mattress factories, railroad shops, wagon-wood plant, oil refineries, corrugated iron and steel works, and manufacturing of oil-well supplies, agricultural

implements, and cotton goods. The surrounding region is adapted to agriculture and stock raising, and oil and natural gas are found in abundance. Muskogee owns its water works, which are valued at \$1,000,000. The city adopted the commission form of government in 1910. Pop., 1900, 4254; 1910, 25,278, 1914 (U. S. est.), 38,309.

MUSKOKA, müs-kō'kū. A lake region of Ontario, Canada, bounded on the north by the Carry Sound district, on the east by Haliburton, on the south by Simcoe, and on the west by Georgian Bay (Map: Ontario, E 3). The region covers an area of about 4000 square miles, 800 feet above the sea and 200 feet above Lake Huron. Besides a lake, river, and county of the same name, it includes extensive forests, several rivers, and from 800 to 1000 lakes and smaller sheets of water. Fine waterfalls also occur, of which the most important are the Bridal Veil Falls on the Shadow River and the High Falls and the South Falls, with a descent of 130 feet, on the Muskoka, near Bracebridge (q.v.). The chief lakes—Muskoka, 20 miles long and 2 to 8 miles broad, Rosseau, 12 miles long and 1 to 6 miles wide, and Joseph—are connected and have regular steamer navigation service in summer, in connection with the Grand Trunk, the Canadian Atlantic, and the Canadian Pacific railways, which traverse the region. The forests abound in game and the lakes with fish, and the district has become popular for its hunting, angling, boating, and bathing.

MUSK OX. The musk ox (*Oribos moschatus*), although approaching cattle in size, is really quite as closely allied to the sheep. It undoubtedly belongs in the family Bovidae and is perhaps entitled to have a subfamily division to itself. The genus contains only the single species, at present confined to Arctic America, but formerly ranging over the northern United States as far south as Kentucky and over northern Asia and Europe also, as is shown by the bones found in the Pleistocene deposits of those regions. Its southern limit is gradually retreating northward, and there can be little doubt that the number of musk oxen is steadily declining. The name "musk ox" or "musk sheep" refers to a peculiar musky odor, the origin of which seems to be in doubt, apparently, however, there is no special gland, as in the musk deer and other musky mammals. The legs are short and stout, so that the animal is somewhat lower than a small ox, which it otherwise resembles in size and shape. The hair is amber brown, woolly, and long, thick, matted, and curly on the shoulders, giving the appearance there of a hump, elsewhere it is straight and hangs down so as to conceal the short tail and upper half of the legs. The wool has been spun into fabrics said to be extremely soft. The hoofs are remarkable in being asymmetrical, the outer half being rounded, while the inner is pointed, the sole of the foot is hairy. The head is inclined to be massive, especially in old males, where the horns have extremely broad bases. The latter are elegantly curved, first obliquely downward and backward by the side of the head and then upward and forward. The ears are so small as to be concealed by the hair, and the muzzle is hairy, as in sheep and goats. The flesh is coarse-grained, but of variable quality, some individuals being tender and of good flavor, while others are tough and so musky as to be uneatable. Curiously enough, the differ-

ence in flavor is apparently not a matter of age or sex. Musk oxen are gregarious, going in flocks of 20 or 30, or rarely as many as 80 or 100, and are said to be very sheeplike in their habits. Although the legs are so short, they run with speed and can climb steep slopes and clamber over rocks with remarkable agility. The young are produced, one at a time, at the end of May or early in June, and the rutting season is in September. The food of the musk ox is grass, moss, lichens, and tender shoots of willow and pine. They are themselves an important item in the larder of the Eskimos and of Arctic explorers. The writings of these explorers contain the best accounts of the animal, whose young have now and then been brought alive to Europe. Consult Julius Schiott, *Musk Oxen in Captivity* (Washington, 1904), Caspar Whitney and others, *Musk Ox, Bison, Sheep, and Goat* (New York, 1904). J. A. Allen, "Ontogenetic and Other Variations in Muskoxen, with a Systematic Review of the Muskox Group, Recent and Extinct," in *American Museum of Natural History, Memoir*, vol. 1 (N. S., New York, 1913). See Plate of WILD SHEEP AND MUSK OX with the article SHEEP.

MUSK PLANT, MUSK ROOT, MUSK TREE, MUSK WOOD. Various plants possessed of a musky odor. Among these are the common musk plant (*Mimulus moschatus*), the musk tree (*Olearia argophylla*) of Tasmania; the musk okra (*Hibiscus moscheutos*); the musk mallow (*Malva moschata*), the musk tree of Jamaica (*Trichilia moschata*), and the West Indian musk wood (*Guarea grandifolia*), used in perfumery. The drug called musk root or sunbul, brought from Asia principally through Russia and Persia, is the starchy root of *Euryangium sunbul*, which has a pure musky odor and is used as a substitute for musk.

MUSKRAT (so called from its musky odor), or MUSQUASH. The muskrat (*Fiber zibethicus*, or *Ondatra zibethica*) is one of the most widely distributed and best known of North American quadrupeds and is peculiar to this continent. It makes its home in the banks or water of streams, ponds, and lakes. It is the largest known species of the subfamily Microtinae of the family Muridae and is peculiarly adapted to an aquatic life, although there are other species of the subfamily which are also amphibious. Its body is about 12 inches in length, and its tail about 8 inches. The body is rather stout and thickset, the head is rounded, and the ears are small and close. The front feet are rather small, with four digits and a rudimentary thumb, while the hind feet are stout, with five partially webbed toes, and so attached to the leg that they are well fitted for swimming, yet the sculling movement of the much compressed tail is the principal means of progress in the water. As with other aquatic mammals, the pelage consists of an undercoat of dense, soft fur and an outer coat, on the back and sides, chiefly of long, shining, smooth hairs. So much air is held by these outer hairs that in ordinary excursions the under fur is hardly wetted. The color above is dark amber brown, darkest on the middle of the back and on the tail, while beneath the prevailing shade is gray.

The musky odor from which the animal gets its name is due to the secretion of a large gland in the inguinal region, which is present in both sexes. The muskrat is omnivorous, eating roots (especially of the pond lily), fruits, vegetables,

insects, worms, mollusks, etc., but it is especially fond of apples, in search of which it often wanders far from its home, and thus finds its way occasionally into barns and cellars. In some localities fresh-water mussels are a favorite article of food, and large heaps of the empty shells are sometimes found near muskrat burrows, due to their preference for dining day after day in the same place. Although so widely distributed and abundant, the muskrat is not often seen, as it is mainly nocturnal in its habits and during the day remains in its burrow or house. The home of this animal is either built of sticks, mud, and grass and forms a heap the size and appearance of a small haycock, or else is dug out of the bank of a stream or pond and then forms a burrow of indefinite length, the entrance to which is under water. The character of the home seems to depend upon the nature of the country, where there is an extensive swamp or stretch of shallow water, so that the houses will not be ordinarily exposed to wandering enemies, muskrats seem to prefer these homes, but where they live in or about a narrow stream, with little swamp, the burrow in the bank is the more usual shelter. The houses are always entered from water deep enough so that the passageway shall not freeze up in winter.

The flesh of the muskrat is good eating and was formerly much used by the Indians. The fur is used quite extensively, so that the skins are an article of commerce. For this reason muskrats are extensively trapped, and hundreds of thousands are killed annually. Their numbers nevertheless do not decrease, partly because their natural enemies are fewer, but chiefly because of the fact that the making of slack-water spaces by damming rivers and the digging of canals (whose banks they seriously damage) have greatly extended waters suitable for them in various parts of the country. Trapping is done, chiefly in the winter, by setting small steel traps at the entrance to their houses or burrows or in runways where they come ashore.

The name "muskrat" is applied to a number of other more or less ratlike animals on account of their strong odor. In Europe it is frequently given to the desman (q.v.), while in India it is associated with a shrew (*Crocidura cerulea*) which has well-developed musk glands on the belly and flanks. In South Africa the genet (*Genetta felina*), a viverrine, carnivorous mammal, is sometimes so called.

Consult the works of Audubon, Richardson, Godman, Kennicott, and other early writers; and of C. C. Abbott, H. D. Thoreau, J. Burroughs, D. L. Sharp, R. Robinson, A. L. Adams, W. Cram, J. A. Allen, E. S. Mearns, and other recent naturalists; especially Butler, "Observations on the Muskrat," in *American Naturalist*, vol. xv (Philadelphia, 1885). Herrick, *Mammals of Minnesota* (Minneapolis, 1892), C. H. Merriam, *Mammals of the Adirondacks* (New York, 1895); Cram and Stone, *American Animals* (New York, 1902); E. T. Seton, *Life-Histories of Northern Animals* (ib., 1909), D. E. Lantz, "The Muskrat," in *United States Department of Agriculture, Farmers' Bulletin*, No. 396 (Washington, 1910), N. Hollister, "Systematic Synopsis of the Muskrats," in *United States Biological Survey, North American Fauna*, No. 32 (ib., 1911). See Plate of BEAVER, COYPU, AND MUSKRAT.

MUSK ROSE. See ROSE; and Plate of ROSES.

MUSK SHEEP. A musk ox (q.v.).

MUSK SHREW. One of a large group of Old World shrews, of which about 80 species of the genus *Crocidura* are known. They are noted for their musky odor, range from the Mediterranean to northern India, and are of terrestrial habits. One of these shrews (*Crocidura cerulea*) is the largest of its race (see SHREW) and as large as a rat. It is gray and is known to Anglo-Indians as the muskrat. It enters houses and at night runs about, catching insect vermin, but counterbalances this beneficial service by leaving behind a musky odor, sometimes unpleasantly strong.

MUSK TORTOISE, MUSK TURTLE, OR STINKPOT. One of the mud or box turtles (*Cinosternum odoratum*) of the eastern half of the United States, well known for its strong, musky odor, which exudes from glands in the armpits. It has a disproportionately large head, a long and slender neck, with two yellow stripes on each side, and a dusky shell, clouded and sometimes spotted. It is edible.

MUSKWAKI, mûsk-wá'ké. An Algonquian tribe. See FOX.

MUSLIM. See MOSLEM.

MUSLIN, müs'lin, IBN AL WALID AL ANSARI (c. 747-803). An Arabic poet who became famous by his songs in honor of the Barmecides (q.v.) and Fadl ibn Sahl, in which he praised wine and love. His *divan* has been published by De Goeje (Leyden, 1875). Consult Carl Brockelmann, *Geschichte der arabischen Literatur* (Weimar, 1898), and R. A. Nicholson, *A Literary History of the Arabs* (New York, 1907).

MUSLIN (Fr. *mousseline*, from It. *mussolino*, muslin, made of muslin, from *mussolo*, muslin, from ML. *Mossula*, from Syr. *Mosul*, a city of Mesopotamia on the Tigris, whence the fabric originally came). A cotton fabric of Oriental origin and now the term for goods marked by lightness and openness of texture. No such trade now exists in the Orient; and for muslins of the common kinds at least the Indian market depends upon the manufactures of England and France. Muslin is much less compact in its texture than calico—indeed, it more nearly resembles gauze in appearance, but it is woven plain, without any twisting of the filling threads with those of the warp. The manufacture of muslins is very extensive, especially printed muslins, in which the patterns are produced by the same processes as in calico printing. The term "muslin" is also applied to a coarser and heavier but plainly woven cotton cloth suitable for sheets and pillowcases. This is sold both bleached and unbleached and comes 36 inches wide. See WEAVING.

MÜSLIN, müs-lên', WOLFGANG. See MUSCULUS, WOLFGANG.

MUSPRATT, JAMES SHERIDAN (1821-71). An Irish chemist, the son of James Muspratt, a well-known chemical manufacturer. He studied under Liebig, at Giessen, 1843-45, and there took the degree of doctor of philosophy, with a thesis tracing the resemblance between the carbonates and sulphites. In 1847 he produced a number of interesting organic substances from the sulphocyanates of ethyl and methyl. On his return to England in 1848 he established and became superintendent of a college of chemistry at Liverpool. From 1854 to 1860 he was engaged on his well-known dictionary of chemistry. The latest German edition of this important work may be found mentioned in the biblio-

graphic section of the article CHEMISTRY. His *Outlines of Quantitative Analysis for Students* has had a considerable circulation.

MUSQUASH. The name among the Indians of the Canadian Northwest for the muskrat (q.v.). "Talking musquash" is a phrase in the Hudson Bay region for the gossip of trappers or fur traders about peltries, of which the fur of the muskrat forms a constant and important item.

MUSSAFIA, mus-sä-fä-ä, ADOLF (1835-1905). An Austrian Romance philologist, born at Spalato. He studied medicine, but in 1855 became instructor in Italian at the University of Vienna and in 1867 professor of Romance philology in the same institution. He contributed valuable papers on Italian dialects to the proceedings of the Vienna Academy and wrote *Altfranzösische Gedichte aus venezianischen Handschriften* (1864); an edition of Fra Paolino's *De Regimine Rectoris* (1868); *Handschriftliche Studien* (1862-70); *Beitrag zur Kunde der norditalischen Mundarten im 15. Jahrhundert* (1873); *Die catalanische Version der sieben weisen Meister* (1876); *Italische Sprachlehre in Regeln und Beispielen* (27th ed., 1904); and studies of the legends of the Madonna (1884-91). A complete bibliography of his productions may be found in the *Festschrift* presented to him shortly before his death in 1905.

MUSCHENBROEK, mus-ken-bruk, PIETER VAN (1692-1761). A Dutch physicist. He was born at Leyden, where he studied medicine, physics, and mathematics at the university, graduating in 1715. He then went to London, where he met Newton. He was appointed professor of physics and mathematics at the University of Duisburg in 1719 and at Utrecht in 1723, and in 1739 he became professor of mathematics at Leyden. His publications include *Epitome Elementorum Physico-Mathematicorum* (1726), a work that passed through several editions; *Elementa physica* (1729); *Physica Experimentales et Geometricæ Dissertationes* (1729); *Introductio ad Philosophiam Naturalem* (2 vols., 1762).

MUSSEL (AS. *muscel*, *muscle*, from Lat. *musculus*, small fish, sea mussel, dim. of *mus*, mouse). The word "mussel" is one of those popular names of such uncertain limits that to attempt to define it is a difficult matter. At the present time it is applied to two totally distinct groups of bivalved mollusks, one marine and the other fresh-water. The first group includes the shellfish of the family Mytilidæ, especially the genera *Mytilus*, *Modiola*, and *Modiolaria*. This family is characterized by the presence of a well-developed byssus, two adductor muscles, a fringed vestige of a siphon, and an equivalve but inequilateral shell, with a thick epidermis, but with a weak and usually toothless hinge. The common mussel (*Mytilus edulis*) of all northern coasts is in the Old World much raised for food, but its greatest importance in the United States lies in its usefulness as bait for fishermen and as manure for farmers near the coast. It is gregarious and occurs in masses, closely crowded together, adhering to rocks, sand, and each other, by the very tough byssus, the whole beds being thus practically spun together. These beds are generally in shallow water, less than 30 fathoms, and are often exposed at low tide. The shell is oblong with a terminal umbone, and generally about 3 inches long by 1½ inches wide; but

under favorable conditions they may become 6 inches or even more in length. The outside of the shell is black, but inside it is pearly blue. When young, mussels move about, but they soon

AMERICAN MARINE MUSSELS

a, common edible mussel (*Mytilus edulis*); b, horse or meadow mussel (*Modiola modiolus*); c, ribbed mussel (*Modiola plicatula*)

anchor themselves by the byssus, and unless artificially disturbed will remain fixed throughout life. So strong are the byssus threads that these mollusks have been utilized as an aid in the strengthening of breakwaters, the young mussels being planted on the rocks in myriads and thus assisting in uniting the separate pieces into a rigid whole. The horse mussels belong to the genus *Modiola*, which does not have the umbone terminal. They are more elongated than *Mytilus* and some species reach a much larger size. See Colored Plate of CLAMS AND EDIBLE MUSSELS.

The other group to which the name "mussel" is given is the family Unionidæ, which are fresh-water mollusks of very wide distribution. The family is characterized by the possession of two adductor muscles and regular shells, with thick epidermis and thin nacreous layer, prominent external ligament, and a variable hinge. Upward of 1000 species have been named, a very large proportion of which occur in the United States, where the family is very abundant and widely distributed. It is still an open question as to what constitutes a valid species or even a genus in this family, though several genera, as *Unio*, *Anodon*, and *Margaritana*, are recognized. These fresh-water mussels occur in lakes, ponds, and streams, generally in large numbers together, and are sometimes 8 inches or more in length, by 4 inches in breadth, but they are usually smaller and narrower. They are sometimes used for food, but are tough and not very palatable. Their chief importance lies in the fact that they frequently produce pearls, and are indeed the only basis of the fresh-water pearl industry. As high as \$25,000 has been paid for a single mussel pearl. (See PEARL.) All of the Unionidæ have a remarkable life history, for the eggs when laid find their way into the mother's gills, where they remain until the young are hatched. Although these young have a bivalve shell, they are totally different from the adults and have a very simple structure. At this stage of development they are called glochidia larvæ. After leaving the maternal gills they attach themselves to the skin of a fish, where they give rise to an excrescence which gradually swells until it is a capsule big enough to see with the naked eye. These capsules are almost black and are usually seen on or near the fins of the host fish; they are often very numerous on a single fish. Within the capsule the glochidium lives until it finally

assumes the adult form, when it breaks through the outer wall of the capsule and settles to the bottom as a miniature mussel. The distribution of the species is therefore mainly dependent on the activity of the fishes which serve as hosts.

Fossil mussels are found in most geological formations from those of Ordovician age to those of recent time. They comprise the superfamily Mytilacea, containing the families Modiolopsidae, Mytilidae, and Dreissensidae. The first, now entirely extinct, are essentially ancestral forms of the Mytilidae, which range through Devonian to recent formations. The Paleozoic species of this family belong mostly to the genus *Modiola*, which began in Devonian, was abundant in Jurassic and Tertiary time, and still persists as a common shell of the littoral zone of all seas. *Mytilus* began in the Triassic *Lithophagus* or *Lithodomus*, the mussel which bores cavities in limestone rock, has been recognized in Mesozoic and Tertiary formations. The Dreissensidae are of later origin, appearing first in the Tertiary. They are essentially freshwater and estuarine mussels, and have probably evolved from *Mytilus* or a closely allied genus of the littoral zone in late Mesozoic or early Tertiary time. Consult A. F. Arnold, *Sea-Beach at Ebb-Tide* (New York, 1903), A. G. Mayer, *Sea-Shore Life* (ib, 1905), Lefevre and Curtis, "Studies in the Production and Artificial Propagation of Fresh-Water Mussels," in *United States Fisheries Bureau, Bulletin*, vol. xxx (Washington, 1912), and other publications of this Bureau. See Plate of ABALONE, ETC., and illustration under MOLLUSK.

MUSSELBURGH, müs'sel-bür-ō. A small seaport town and parliamentary burgh in the County of Edinburgh, Scotland, at the mouth of the Esk, 6 miles east of Edinburgh (Map Scotland, E 4). Tanning, leather dressing, and the manufacture of sailcloths, nets, paper, wire, oil, and salt are carried on. The surrounding land has coalpits, and is much cultivated by market gardeners. The harbor at Fisherrow is frequented by coasting craft and by small vessels from Holland and the Baltic. There are famous golf links here. Pop., 1901, 11,711; 1911, 15,938.

MUSSEL DIGGER. A popular name for the California gray whale.

MUSSEL PICKER. See OYSTER CATCHER.

MUSSEL POISONING. A severe form of poisoning which arises from eating stale or decomposed mussels or those which have become toxic from their surroundings. The liver of certain mussels contains a substance called mytilotoxin, a very active poison to man. The symptoms of mussel poisoning are profound general nervous depression, with violent gastrointestinal irritation, and resemble closely those of ptomaine poisoning. Decomposed fish, stale oysters, and certain salted fish, such as the sturgeon of Russia, give rise to identical symptoms. The treatment is promptly to rid the gastrointestinal canal of its contents, to relieve the pain by morphine and warm cataplasms, and to stimulate the patient with brandy, champagne, strychnine, or similar quickly acting drugs. See PTOMAIN POISONING.

MUSSEL SCALE. A diaspine scale insect of the genus *Mytilaspis*, all of the species of which bear scales shaped like a mussel shell or the shell of an oyster. Several species are very injurious to vegetation. The so-called oyster-shell barklouse of the apple (*Mytilaspis pomorum*) is a cosmopolitan enemy of apples and pears,

and the long scale and the purple scale of the orange are pernicious examples.

MUS'SER, JOHN HERR (1856-1912). An American physician, born at Strasburg, Pa. Graduating M.D. from the University of Pennsylvania in 1877, he continued his studies in Europe and then settled in Philadelphia, where he practiced until his death. He became visiting and consulting physician to various hospitals and was professor of clinical medicine in the University of Pennsylvania, with which institution he was connected after 1881. In 1904-05 he was president of the American Medical Association. His contributions to medical literature were numerous, he wrote articles for Hare's, Osler's, and Notlingel's *Systems*, and was author of *Practical Treatise on Medical Diagnosis* (1889, 5th ed, 1904) and *Handbook of Practical Treatment* (1911-12), with A. O. J. Kelly.

MUSSET, niq'sa', ALFRED DE (1810-57). A noted French poet, dramatist, and novelist, born in Paris, Nov. 11, 1810. His father was a man of letters, and Alfred grew up in a literary atmosphere, was graduated with honors at the Collège Henri Quatre, and published at 20 his first verses, *Contes d'Espagne et d'Italie* (1830). Thus, with *Poésies diverses* (1831) and *Le spectacle dans un fauteuil* (1832), established his fame. The latter contained a poem, *Amour*, and two short plays in a manner peculiarly his own, *La coupe et les lèpres* and *A quoi rêvent les jeunes filles*. He had already produced on the stage a comedy, *La nuit vénitienne* (1830), a failure. In 1833 he followed the dramatic vein in two tragi-comedies, *André del Sarto* and *Les caprices de Marianne*, possibly his best. *Rolla*, too, belongs to this year, and was once thought the French *Child Harold*, though now less admired. This sudden flowering of Musset's genius was interrupted by a reckless passion for George Sand (q.v.), whom he first met in the summer of 1833 and accompanied in 1834 to Italy as her secretary. He suffered acutely in this new relation from disillusionment and self-deception. He "was a child all his life and a spoiled child," never more so than in the inevitable estrangement (1835) that cost George Sand few pangs, but marks a cardinal point in Musset's career. He returned sick, experienced another unhappy love and a series of sordid entanglements, and worked intensely and admirably, at intervals interspersed with periods of depression. Through the patronage of the Duc d'Orléans he received a position as librarian in 1838.

Musset's work after the separation from George Sand (*Les nuits*, *Sonnet*, *Lettre à Lamartine*, *Esprit en Dieu*) shows at its best a sad, yet in the main sober, resignation. But during this period he was more occupied with drama and with prose fiction. Of the *Comédies et proverbes*, *Fantasio* and *On ne badine pas avec l'amour* belong to 1834, *Le chandelier* to 1835, *Il ne faut jurer de rien* to 1836. *Lorenzaccio*, an historical drama (1834), had no success. These, as Lemaître points out in his preface to Jouaust's *Théâtre d'Alfred de Musset*, show the most genuine and original dramatic talent of all the Romantic school. Tragedy mingles here with comedy, not as with Hugo by juxtaposition, but by interpenetration, for Musset had too true a taste to yield to the extravagances of Dumas or Hugo. In an essay *La tragédie* (1838) he refuses allegiance alike

to French romantic and classic principles, but he combines the outward appearance of restraint with the new liberty to associate the weird and terrible in human life with its higher comic aspects. Thus he succeeded in presenting complex characters better than any of his contemporaries or predecessors in French drama. His wit in dialogue had not been equaled since Beaumarchais. None of these plays was acted in France before 1848, and their influence is hardly noticeable before 1865, but they contain the quintessence of romantic imaginative art. They show most and best the unchecked freedom of fancy that joined with the spirit of realistic comedy in Ponsard, Dumas, and Augier to produce the modern French drama. Musset's profection begins with *Les confessions d'un enfant du siècle* (1836), which in spirit at least is autobiographic. This was followed by nine *Contes* (1837-44), of which *Croisilles* is best, and a tenth, *La mouche* (1851), one of the last flickerings of his genius. These are interesting chiefly in exhibiting the progress of ethical disintegration. *Margot* and *Le meile blanc* have autobiographic elements. So perhaps has *Mimi Pinson*, a "profil de grisette" (1845). In this story Musset anticipates by some six years a type of the French working girl portrayed by Henri Murger. Mimi has few clothes, but she looks as tidy as she can, and has the pretty manners, the recklessness as to the future, and the easy morality of the *grisette*. Musset's critical essays are also worthy of remark, especially the witty *Lettres de Dupuis et Cottonet*, satirizing modern marriage, journalists, novelists, and, above all, the cities of thoroughbred romanticism. Musset's closing years were marked by dejection and by comparative inactivity. In 1841 he flung at the Germans his fiery war song, *Le Rhin allemand*. In 1845 appeared *Il faut qu'une porte soit ouverte ou fermée, a proëmb*. In 1847 *Un caprice* (1837), a little tragedy with a chorus to utter platitudes in Greek style, was performed at the Théâtre Français. Between 1848 and 1851 *Bettine* was played and *Carmosine* was written, but they are scarcely worthy of their author.

Musset died of an affection of the heart, May 2, 1857. His works were published in 10 volumes in 1865.

MUSSEY, REUBEN DIMOND (1780-1866). An American surgeon, born at Pellham, N. H.

He graduated at Dartmouth in 1803 and received the degree of M.D. from the University of Pennsylvania in 1809. Mussey held medical professorships at Dartmouth, Cincinnati, and Miami Medical College and gained a high reputation as a bold and skillful operator. From 1860 he practiced in Boston. He was one of the first to tie both carotid arteries (1827), and the first to remove completely the shoulder blade in two stages (1837), and was unusually successful in lithotomy and operations for strangulated hernia. In 1850 he was president of the American Medical Association. He wrote: *An Essay on the Influence of Tobacco upon Life and Health* (1836; 3d ed., 1839). *Alcohol in Health and Disease* (1856), *Health Its Friends and its Foes* (1866).

MUSSORGSKY, mūs-sōrg'skē, MODEST PETROVICH (1835-81). A Russian composer, born at Karev in the Government of Pskov, March 28, 1835. His earliest instruction on the piano was from his mother, and his progress was so rapid that at the age of 10 he was a performer of no mean ability. When he entered the Military Academy at St. Petersburg, he continued to study the piano with Gerke, but without thought of taking up music as a profession. After graduation he entered one of the crack regiments of the Russian army. In 1857 he made the acquaintance of Dargomyzhki (qv.), who introduced him to the leaders of the younger national school. Among these it was Balakirev (qv.) who recognized Mussorgski's unusual dramatic talent. Although he did not give him regular instruction, he supervised in a general way the younger man's study of Beethoven, Schumann, and Glinka. It is much to be regretted that throughout his career Mussorgski was handicapped by his inadequate technical equipment. Resigning his military commission to devote his whole energy to composition, for some years he struggled against poverty. Recognition did not come, and in 1863 he accepted an uncongenial post under the government, which circumstances compelled him to hold till his death. An opera, *Salammbô*, he did not complete, but used much of the music later in *Boris Godunov*. For a time he cultivated the song, producing masterpieces which to this day are unsurpassed and scarcely rivaled by the work of any Russian composer. The two next attempts at opera, *The Match-Maker* and *The Fair at Sorochinski*, remained fragments. In 1868 he began *Boris Godunov*, a typical national subject treated with wonderful dramatic power. It was completed two years later, but not produced until 1874, after considerable changes had been made. In 1896 it was performed, revised, and completely reorchestrated by Rimski-Korsakov (qv.), and in this form has become a fixture in the repertory of all Russian opera houses. From 1872 to 1880 Mussorgski worked intermittently on his second completed opera, *Khovanstchina*, also revised by Rimski-Korsakov. He died in St. Petersburg on his forty-second birthday. The list of his works is completed by the enumeration of the orchestral compositions *Intermezzo in modo classico*, *Scherzo*, a fantasia, *A Night on the Bare Mountain*, and *Turkish March*; the choral works *The Defeat of Sennacherib* and *Joshua Navi*; and a suite for the piano, *Pictures from an Exhibition*.

MUS/SULMAN. See MOSLEM.

MUSTAGH (mōō-stāg') **MOUNTAINS**. A

mountain range in Kashmir. See KARAKORAM MOUNTAINS

MUSTANG. See Plate of EQUINE

MUSTAPHA, mus'tā-fā. The name of four Ottoman sultans.—The first (1591–1639), a feeble-minded son of Mohammed III, succeeded Achmet I in 1617, was deposed after three months, came to the throne again in 1622, and was again deposed (1623).—**MUSTAPHA II** (1664–1704) came to the throne in 1695, and at the Peace of Carlowitz signed away the Morea, the Ukraine, Hungary between the Danube and Theiss, and Azov. He was deposed by a rising of the Janizaries in 1703.—**MUSTAPHA III** (1717–73) ruled from 1757 until his death. He quarreled with Russia and Poland and involved the country in war which lasted through his reign. His internal reforms were no more successful than his foreign policy.—**MUSTAPHA IV** (1779–1808) was made Sultan by the Janizaries, who rebelled against Selim III in 1807, and was deposed and killed in the next year.

MUSTAPHA, KARA, kü'rá. A Turkish grand vizier. See KARA MUSTAPHA.

MUSTAPHA FAHMY PASHA (?–1914). An Egyptian statesman. When the English went into Egypt, he immediately entered into close relations with them. He succeeded Riaz Pasha as Premier of Egypt in 1891, but was summarily dismissed in 1893 by the new Khedive, Abbas Hilmi, as being too friendly to the English. Two years later he again became Premier, and held that office until November, 1908. Throughout his term of office he cooperated with Lord Cromer (q.v.) in the governing of Egypt. In 1914 he was appointed president of the council of ministers.

MUSTAPHA RESHID PASHA (1800–58). A Turkish statesman, born at Constantinople. He served as Ambassador at Paris (1834–36, 1841–43, 1843–45) and at London (1836–37, 1838–41), as Minister of Foreign Affairs (1837–38), and as Vali of Adrianople (1843). During 1845–57 he was six times Grand Vizier, and in that capacity championed reform measures. The skillful part he played in connection with the Egyptian question in 1840 and at the time of the Crimean War brought him European recognition. He was largely responsible for the remodeled Tanzimat, or Turkish administrative code.

MUSTARD (OF. *moustarde*, Fr. *moutarde*, from OF. *moust*, from Lat. *mustum*, must, neut. of *mustus*, fresh), *Brassica*. A genus of plants of the family Cruciferae, having yellow flowers and linear or oblong pods, which terminate in a sword-shaped, compressed, or four-cornered beak and contain one row of seeds. The black mustard (*Brassica nigra*) is an annual, which grows wild in fields and by waysides in the middle and south of Europe. Its pods are bluntly four-angled, smooth, erect, and lie close to the stem, their valves one-nerved; the leaves are smooth, the lower ones lyrate, the upper linear-lanceolate, the seeds are brownish black. White mustard (*Brassica alba*), also a native of most parts of Europe, is an annual having divergent pods covered with stiff hairs, the valves five-nerved, the seeds yellowish, the leaves pinnatifid. Both these species are cultivated in Europe and to a limited extent in America, for their seeds, which are ground into powder to make the well-known condiment called mustard. The mustard of commerce is frequently mixed with flour and

colored with turmeric. The powder of the seeds is also much used in medicine as a rubefacient. Mustard seeds depend for their pungency on the volatile oil of mustard. There is also in the seeds a bland fixed oil, oil of mustard, which is obtained from them by expression, and constitutes about 28 per cent of their weight. White mustard is often sown in gardens and forced in hothouses for use as a salad, and is also sometimes sown as a green manure crop and for feeding sheep, when turnip or rape has failed. Wild mustard, or charlock (*Brassica arvensis*), which is distinguished by tufted and knotty pods with many angles and longer than the two-edged beak, is a troublesome annual weed in both Europe and America. It may be controlled by spraying with a 2 per cent solution of copper sulphate or 12 to 15 per cent iron sulphate at the rate of 50 to 70 gallons per acre. (See HERBICIDE.) Indian mustard (*Brassica ramosa*) is extensively cultivated in India for its seeds, which are used as a condiment, as are those of *Brassica dichotoma* and *Brassica glauca* (regarded by some botanists as forms of *Brassica arvensis*), also cultivated in India. Other species are curled mustard, *Brassica japonica*, used to a considerable extent in the United States for greens; a turnip-rooted Chinese form (*Brassica napiformis*), and Chinese mustard (*Brassica juncea*). Hedge mustard, *Sisymbrium officinale*, tumble mustard *Sisymbrium altissimum*, hare's ear mustard, *Conringia orientalis*, and garlic mustard, *Althaea officinalis*, are introduced species, becoming troublesome weeds in many parts of the United States. See illustration of CABBAGE AND ALLIES.

MUSTARD FAMILY. A family of plants. See CRUCIFERÆ

MUSTARD OIL, or OIL OF MUSTARD, chemically known as allyl isothiocyanate, C_3H_5NCS . A volatile oil obtained from black mustard, the seeds of the *Brassica nigra*, growing in Asia and in southern Europe. The seeds contain a bland fixed oil which may be removed by expression, but they do not contain the volatile oil ready-formed. The latter is produced by the action of a soluble ferment (myrosin) upon the potassium salt of myronic acid (a glucoside) in the presence of water. Both myrosin and potassium myfonate are contained in black mustard seeds. If, therefore, after the fixed oil has been removed, the crushed seeds are treated with water and distilled, the volatile oil is obtained, in much the same way as the volatile oil of almonds is obtained from bitter almonds. (See BENZALDEHYDE.) Mustard oil is a very volatile colorless liquid, having a painfully pungent odor and an acrid taste, when applied to the skin it speedily raises blisters, it is insoluble in water and, if pure, boils at $151^{\circ}C$. Its formation from potassium myronate takes place according to the following chemical equation:

The pungency of ordinary mustard as a condiment is due to the formation of the volatile oil on addition of water. The allyl isothiocyanate prepared by an artificial process in the chemical laboratory is identical with the volatile oil obtained from mustard seeds.

The term "mustard oils" is often applied to organic isothiocyanates in general.

MUSTELIDÆ (Neo-Lat. nom. pl., from Lat. *mustela*, weasel, from *mus*, mouse). The family of small carnivores, represented by the weasel and embracing the more highly valued fur-bearing animals. They are related to the arctoid Carnivora, especially the bears, and the family includes three groups, as follows: (1) Melinæ (the Old World badgers), (2) Mustelinæ (grison, marten, sable, wolverine, polecat, weasels, ratel, American badger, and skunks); (3) Lutrinæ (otters). Consult authorities cited under MAMMALIA, especially Beddard. See FUR-BEARING ANIMALS

MUSTER (from OF. *motic*, *monstre*, Fr. *montré*, show, from Lat. *monstrare*, to show, from *monstrum*, portent, monster, from *monere*, to warn). When used in its military sense, this term applies particularly to the assembling of troops for the verification of membership. In the United States the troops are mustered for pay on the last day of each month, each stated muster being preceded by a minute inspection. In the British army there is a special muster parade once each year, when every individual of each command must respond in person to the regimental muster roll. In the United States navy the crew is mustered or assembled at least once (usually two or three times) a day for drill, for instruction, or to ascertain if all are on board. Once a week, on Saturday morning, the crew is mustered and inspected by the commanding officer. It was formerly the practice to have general muster once a month on the first Sunday of each month. General muster is now held less often, on account of the size of the crews of large ships, and usually takes place on Saturdays. The presence of the officers is ascertained by inspection, but the names of the crew are called by the paymaster or his clerk, and each man in turn, except petty officers, as his name is reached, passes across the deck in front of the captain. It was formerly the custom to muster the crew aft and read the Articles for the Better Government of the Navy and then call the muster roll of the crew. The two performances now take place on different days, and on very large ships the Articles for the Better Government of the Navy are read by the divisional officers to their divisions.

MUSU. See MOXOS

MUSURUS, mō'su-rūs, MARCUS (c.1470-1517). A Greek scholar, born at Retimo in Crete. He was a pupil of Andreas Johannes Lascaris at Venice. In 1505-09 he was professor of Greek at Padua, and from 1509 onward he held a like professorship at Venice. From 1493 he was associated with Aldus Manutius (q.v.), the printer, and supervised, among other things, the first edition of the scholia of Aristophanes (1498), of Athenæus (1514), Hesychius (1514), and Pausanias (1516). Consult J. E. Sandys, *A History of Classical Scholarship*, vol. ii (Cambridge, 1908).

MÛT, mōūt. An Egyptian goddess, the wife of Ammon (q.v.) of Thebes and the mother of Chons (q.v.). Her name signifies "mother," and in the inscriptions she is entitled "the lady of heaven, the queen of the earth." The chief temple of the goddess was at Karnak, it was connected with the great temple of Ammon by a long avenue of sphinxes and was partly surrounded by the sacred lake Asher. From the latter circumstance Mût is often called "the lady of Asher." She is frequently represented

as a lion-headed goddess wearing upon her head the solar disk, but in mural decorations she is more commonly depicted in human form wearing the vulture headdress and other symbols of a queen of Egypt. In the period from Amenhotep IV to Akhen Aton (1375-1350 B.C.) she shared in the persecution set on foot against Ammon and his family. Consult. K. A. Wiedemann, *Religion of the Ancient Egyptians* (New York, 1897); Benson and Gourlay, *The Temple of Mût in Asher* (London, 1898); Georg Steindorff, *The Religion of the Ancient Egyptians* (New York, 1905); Mallon, in Joseph Huby, *Christus: Manuel d'histoire des religions* (Paris, 1912), containing a bibliography.

MUTANABBI, mō'ta-na'bē (Ar. *Abu'l Tayyib Ahmad ibn al Husayn al Mutanabbi*) (905-965). One of the most noted of the Arabic poets of the period of decline. He was born in Syria, the son of a water carrier, and spent several years in the desert *al Samāwa* (Mesopotamia). He was not a fervid Moslem and at one time even put himself forward as a prophet (whence his name Mutanabbi, the one claiming to be a prophet). He was taken prisoner by Lulu, the Ikshid Emir of Emesa. After being set at liberty he lived in great poverty and neglect, but in 948 became attached to the court of Saif al Daula at Aleppo, whom he accompanied on his raids and whose praises he sang. He left Saif al Daula in 957, going over to his enemy the Ikshid Kafur of Egypt. In 961 he went to Bagdad and at last to Shiraz, where the Buwayid Adud al Daula became his patron. He was murdered in 965 on the road from Shiraz to Kufa. His *Du'wān*, containing 289 poems, has been very widely read in the East, where he is considered the last great Arabic poet, perhaps because of his intense national feeling. No less than 40 commentaries have been written on his *Du'wān*. Mutanabbi is the type of the court singer, his theme the battle and the heroic deeds of his patrons. His songs lack the fire of the earlier Bedouin poetry and are artificial, but their technical excellence cannot be denied. They have been edited by Dieterici, with the commentary of *al-Wāhidi* (Berlin, 1861), and published at Bulak (1860) and Cairo (1870, 1890) with that of *al-Ukbari*. Other editions are: Calcutta (1815), Beirut (1860), Bombay (1892). The *Du'wān* has been completely translated by Hammer-Purgstall, *Motenebbi der grösste arabische Dichter* (Vienna, 1824), extracts may be found in Rückert's *Hamasa* (Stuttgart, 1846) and in Ouseley, *The Oriental Collection*, vol. i (London, 1797).

MUTASE. See ENZYME.

MUTATION, mū-tā'shūn (Lat. *mutatio*, change, from *mutare*, to change, for *movitare*, frequentative of *movere*, to move, Skt *mbi*, to push). The hypothesis that evolution (q.v.) takes place by means of sudden changes rather than through slow and almost imperceptible

transformations. This idea, though not new, was called into great prominence by the publication in 1901 of *Die Mutationstheorie* by Prof. Hugo de Vries, professor of botany at Amsterdam. Darwin himself, especially in his earlier works, recognized that "single variations" or sports are to be reckoned with as well as natural selection. Through the influence of Wallace and others natural selection had come to be the ruling theory, and it is only in recent years that the significance of sports in evolution has had much place. However, as long ago as 1864 K  lliker made an appeal for heterogenesis (which is identical with the mutation of De Vries) as a factor in the evolution of species. Professor Scott, of Princeton, has used the word "mutation" for gradual modifications. Still other writers have referred to the sudden origin of species as saltatory evolution. But De Vries is the first author who has performed experiments and worked out a theory to fit the facts which they have yielded.

Before taking up the experiments it may be said that mutation involves no necessary abandonment of natural selection, except in so far as it may have been held to account for the actual origination of new characters. Darwin recognized that natural selection improves but cannot originate anything new, mutation, on the other hand, is a means for the development of new characters and even a new assemblage of characters, i.e., a new species. It should be stated, however, that De Vries gives but little place to natural selection, even as a means of improving something already present. His experiments show that there is a definite and rather narrow limit to individual variation, and the full advantage of artificial selection along any given line can usually be obtained within a few generations, as in the parsnip or carrot. He claims also that natural selection never fixes a character, but that reversion to the original may occur after many generations. Mutation, on the other hand, is believed to bring into existence something wholly new, without any transitions or connecting links. The new form, i.e., the mutant, remains fixed from the outset, and, if it is fit, it will remain as a new species.

In 1886 De Vries observed a colony of evening primrose (*Oenothera lamarckiana*) in which were two forms differing strikingly from the common type. Feeling that these aberrant forms doubtless came from the same parentage as the more common forms, he made artificial cultures to see if further aberrant forms would develop. He found such to be the case to an astonishing degree. Out of 50,000 seedlings of *Oenothera lamarckiana* in the various years of study, 800, or about 1.5 per cent, were mutants, while 98.5 per cent came true to seed. More than one-fourth of the 800 mutants were of one type, which De Vries named *Oenothera lutea*, i.e., this form appeared anew in cultures more than 200 times. A form which he called *Oenothera gigas* appeared but once. When cultures are made from these new forms, they are found to come true to seed except for occasional mutations; nor was any tendency to reversion observed. To these new forms, as to the two aberrant types observed in 1886, De Vries has given names which imply that these forms are actually new species. They have, he says, all the characteristics of species, differing not in one, but in several, characters and remaining constant in all cultures. He shows that they

are as much entitled to be considered separate species as are the various members of the natural group to which the parent *Oenothera lamarckiana* belongs. Indeed, it is possible to identify most of the new species even while yet seedlings. There are no transitions between parent and offspring or between one new species and another. There is no slow and gradual fixation of characters by natural selection, but the new species is complete from the outset. Most of these new forms would doubtless disappear in a natural state, for they would be obliged to engage in a keen struggle with species already present or would gradually suffer the loss of their specific characters through hybridization. However, some new species, especially if stronger than the parent form, might survive and extend their area. The two aberrant types first observed in a field in 1886 are still to be seen there and in greater numbers. Thus, it may be said that De Vries has seen the birth of new species, a phenomenon which all evolutionists have wished to see.

It is of interest to observe that, independently and almost simultaneously with De Vries, Korschinsky brought together a vast mass of data under the title "Heterogenesis and Evolution." From the records of gardeners and horticulturists he concluded that most cultivated varieties of plants have arisen suddenly as sports, i.e., through heterogenesis or mutation.

A large amount of experimental work has been stimulated by the mutation theory, so that the literature has become extensive, including also the cytological features of mutants. The chief objection urged against the theory is the claim that *O. lamarckiana* is a hybrid mixture, and that mutants are simply the products of a splitting hybrid which do not follow the Mendelian ratio. Much experimental work has been done, especially by Davis, in attempting to prove this claim, the difficulty of the proof lying chiefly in the fact that *O. lamarckiana* has disappeared as a wild plant and is known only as an introduced plant and in cultivation. Recently De Vries has shown that *O. biennis*, a species concerning whose purity no doubt has been expressed, is mutating almost as freely as *O. lamarckiana* and in the same directions. Bartlett also has discovered recently wild species of *Oenothera* from Kentucky that are mutating with remarkable freedom.

Bibliography. S. Korschinsky, *Tentamen Flora Rossica Orientalis* (Leipzig, 1901); Hugo de Vries, *Plant Breeding* (Chicago, 1907); id., *Mutation Theory*, translated from the German by Farmer and Darbishire (2 vols., 1b., 1909-10); R. H. Lock, *Recent Progress in the Study of Variation, Heredity, and Evolution* (new ed., New York, 1910); J. M. Coulter, *Fundamentals of Plant Breeding* (1b., 1914); Bailey and Gilbert, *Plant Breeding* (1b., 1915). The present status of the mutation theory, as presented by De Vries, together with a summary of the recent experimental work, may be found in the *Botanical Gazette*, vol. lxx (Chicago, March, 1915). See BIOLOGY.

MUTATION STOPS. See ORGAN, *The Stops*.

MUTATION THEORY. See MUTATION.

MUTAZILITES (Ar *Mu'tazilah*, from *'azala*, to separate). A Mohammedan sect founded by Wasil ibn Ata (c.745) and his disciple Abu'l Hudhail al Allaf (died c.845). They had rationalistic tendencies, illustrated, e.g., by the

teaching of Abu'l Hudhail that man knows right and wrong by reason, independent of supernatural revelation. Later teachers developed several subdivisions of the sect. See MOHAMMEDAN SECTS.

MUTE (from Lat. *mutus*, dumb; connected with Skt. *mūka*, dumb). A small instrument used to modify the sound of any of the string instruments. It is made of hard wood, ivory, or brass, and is attached to the bridge by means of a slit, a leg of it being interjected between every two strings. The use of the mute both softens the tone and imparts to it a peculiar muffled and tremulous quality, which is sometimes very effective. It is much used in dramatic music to give color in dreamlike or mystic situations. Its application is indicated by the letters *c. s.* or *con sordani*, and its discontinuance by *s. s.* or *senza sordani*. Mutes for brass instruments are wooden cones with a hole bored through them to allow the passage of the air. They are inserted into the bell of the instrument. But, as their insertion affects the pitch of the instrument, these mutes must be used with the utmost care. Recently attempts have been made to construct complicated mutes for brass instruments that shall not affect the pitch. In the case of horns and trumpets the left hand is used as a mute. Mutes are also used for drums. On snare drums a piece of cloth or felt is inserted on the lower side between the membrane and the snares. Kettledrums are covered with a cloth or the membrane is lightly touched with the left hand. On the piano the soft pedal is frequently called mute.

MUTES. A term applied in phonetics (q.v.) to articulate sounds, also called occlusives, plosives, or stop sounds, produced by a momentary narrowing or closure, followed by a reopening of some portion of the oral passage. Phonetically speaking, every mute or stop sound consists of three parts, the closing and the opening of the passage and the pause between. If this interval is noticeable to the ear, the consonant is then called double. The mutes are furthermore either voiced (sonant, breathed) if the breath stream makes the glottal chords vibrate, or voiceless (surd, unbreathed) if the glottal chords are at rest, as *b, p, d, t; f, v*. All of the mutes can, however, be formed with a whisper. If the closure is produced in the mouth, after which the breath bursts through the obstacle, the sound is called an oral stop; but if, on the contrary, the breath passes out through the nose, it is called a nasal stop (*n, m*). By philologists mutes are usually designated surd, sharp or smooth (*tenues*), sonant, flat, middle or medial (*mediae*), and aspirate or rough (*aspiratae*). Stopped or short mute consonants are produced by a complete closure at some point in the mouth (*k, t*). Open consonants are formed by narrowing the oral passage without complete contact (*th, kh, s*). With respect to the point of occlusion, mutes are classified as gutturals (front or back), *k, kh, g, gh*; palatals, *c, ch, j, gh*; linguals (cerebrals, cacuminals), *t, th, d, dh*; dentals, *t, th, d, dh*, and labials (lip stops), *p, ph, b, bh*. According to recent scientific classification, the consonant system is divided, according to the point of formation, into back or guttural, front or palatal, point (including blade), teeth, and lip consonants, according to the conformation of the vocal organs, into open, divided, stopped, and nasal consonants, and trills. The

essential psychological condition for the mutes lies not in the closure but in the reopening of the oral passage, while their quality is determined by the presence or absence of breath and by the point of occlusion. Consult Henry Sweet, *Sounds of English* (Oxford, 1908); Walter Rippmann, *The Sounds of Spoken English* (London, 1910); Otto Jespersen, *Lehrbuch der Phonetik* (Berlin, 1913); P. E. Passy, *Les sons du français* (Paris, 1913); Wilhelm Vietor, *Elemente der Phonetik des Deutschen, Englischen und Französischen* (Leipzig, 1914).

MUTHER, mōō'tār, RICHARD (1860-1909). A German critic and historian of art. He was born at Ohrdruf and studied at Heidelberg and at Leipzig, where he took his doctor's degree. In 1883 he was privatdocent at the University of Munich and in 1885 conservator of the cabinet of prints. At Breslau, where he was appointed assistant professor in 1894, he became full professor the next year. He was one of the most prominent German art historians of his time, and is especially known for his writings on nineteenth-century art. His style is bright and interesting, with a slight tendency towards the journalistic, and his criticism, though subjective, is highly appreciative. His principal work is *Geschichte der Malerei des 19ten Jahrhunderts* (1893, Eng. trans. *History of Modern Painting*, new ed., 4 vols., 1907). Another important work, written from the psychological point of view, is *Geschichte der Malerei* (5 vols., 1899-1902, in English as *The History of Painting*, trans. and ed. by George Kriehn, 2 vols., 1907).

MUTI IBN IYAS, mōō'tē ibn ē'yās. An Arabic poet of the eighth century. His father was a Palestinian and with Hajja against Abd Allah ibn Zubair (q.v.), but he was himself born at Kufa, and after the fall of the Ommiad dynasty he became attached to the court of Al Mansur, where he remained until his death. He is the first representative of the new school of Arabic poetry that flourished at Bagdad and is characterized by delicacy, refinement, and frivolity. Consult: Ignaz Goldziher, *Abhandlungen zur arabischen Philologie*, vol. i (Munich, 1896); Carl Brockelmann, *Geschichte der arabischen Literatur*, vol. i (Weimar, 1898); R. A. Nicholson, *A Literary History of the Arabs* (New York, 1907).

MUTIANUS, mōō'ti-a'nus, CONRADUS RUFUS (1471-1526). A German humanist, whose name in the vernacular was Konrad Mut. He was born at Homberg, studied under Hegius at Deventer, then at Erfurt, and for seven years in Italy. Thence he brought to Germany the idea of a humanistic association or academy, and by his letters from Gotha became the centre of the *Mutianische Bund*, which included Justus Jonas and Camerarius. Although he did not make common cause with Luther, Mutianus and his followers boldly attacked the abuses of the Church, and it seems certain that the *Epistole Obscurorum Virorum* (q.v.) owed their authorship to this circle. Consult C. Krause, *Der Briefwechsel des Conradus Mutianus* (Kassel, 1885), and Gilbert, *Der Briefwechsel des Conradus Mutianus* (Halle, 1890).

MUTINA. The Roman name of the city of Modena (q.v.).

MUTINY. (from OF., Fr. *mutin*, mutinous, from *meute*, sedition, from ML. *mota*, revolt, *muta*, change, from Lat. *mutare*, to change). Mutiny at military law is unlawful opposition

or resistance to lawful military authority with intent to subvert the same or to nullify or to neutralize it for the time. (Winthrop, *Military Law*, p. 892.) In the United States the acts constituting mutiny are exciting, causing, or joining in any mutiny or sedition in any troop, battery, company, party, post detachment, or guard, and are punishable with death or such other punishment as a court-martial may direct. (Twenty-second Article of War.) The punishment of death or such other punishment as a court-martial may adjudge may be inflicted on any person in the naval service who commits any of the acts which constitute mutiny. (Revised Statutes, § 1624.) In England an annual act of Parliament passes to punish mutiny in the army and navy (See **MUTINY ACT**.) Under the British articles "every one commits felony, and is liable upon conviction thereof to penal servitude for life as a maximum punishment, the maximum alternative term of imprisonment being three years, who maliciously and advisedly endeavors (a) to seduce any person serving in His Majesty's forces by sea or land from his duty and allegiance to His Majesty; or (b) to incite or stir up any such person to commit any act of mutiny, or to make or endeavor to make any mutinous assembly, or to commit any traitorous or mutinous practice whatever."

While mutiny is, in general, a concerted proceeding, a single officer or soldier may commit the offense. It is an offense punishable with death for a soldier or officer being present at a mutiny not to use his utmost endeavor to suppress it, or, having come to the knowledge of a mutiny (or intended mutiny), not to give information of it to his commanding officer. (British and American Articles of War.)

Acts not characterized by an intent to subvert lawful authority, while they do not come within the legal definition of mutiny, may be regarded and punished as conduct tending to mutiny but clear of the completion or commission of the offense. The law makes a distinction between mutiny and mutinous conduct, the latter being charged, and tried by court-martial, not under the mutiny articles, but as conduct to the prejudice of good order and military discipline.

Mutiny at Maritime Law is committed when there is a usurpation of the authority and command of a ship and an overthrow of that of the master or commanding officer. Any conspiracy to accomplish such an object, or to resist a lawful command of the master for such purpose; any endeavor to stir up others of the crew to such resistance, is an endeavor to commit a revolt within the meaning of the Statute of 1790. (1 Stat. L., 113; *Abbott's National Digest*, 3. Mutiny.) The offense of making a revolt or mutiny on a ship is no longer punishable as a capital offense. (Act of March 3, 1835.)

For United States law on the subject of mutiny, see Revised Statutes, § 1324, Arts. 22 and 23; § 1624, Arts. 4 and 8; §§ 4956, 5359, 5360

MUTINY ACT. An act of the British Parliament passed from year to year, investing the crown with powers to regulate the government of the army and navy and to frame the articles of war. By the Bill of Rights the maintenance of a standing army in time of peace, unless by consent of Parliament, was declared illegal, and from that time the number of troops to be maintained and the cost of the different branches of

the service have been regulated by an annual vote. But Parliament possesses a further and very important source of control over the army. Soldiers, in time of war or rebellion, being subject to martial law, may be punished for mutiny or desertion, but the mutiny of Dumbarton's Scottish regiment soon after the Revolution of 1688 raised the question whether military discipline could be maintained in time of peace, and it was decided by the courts of law that, in the absence of any statute to enforce discipline and punish military offenses, a soldier was amenable only to the common law of the country. The authority of the Legislature thus became indispensable to the maintenance of military discipline, and in 1689 Parliament passed the first Mutiny Act, authorizing, for a period of six months, the punishment of desertion by martial law. Subsequently this Act was passed at the beginning of each session and by limiting its duration to one year annual sessions of Parliament were made indispensable. In July, 1879, the Mutiny Act and the Articles of War were consolidated with a few changes into a complete military code called the Army Act, passed annually as before.

MUTSU, *mut'su* or *mut's*, **MUNEMITSU**, **COUNT** (1842-97). A Japanese statesman, born in Wakayama. He visited Europe in 1871, became Governor of Kanagawa when he returned to Japan, and in 1874 was made Secretary of the Senate. Involved in Saigo's rebellion, he was imprisoned in 1878, but was pardoned in 1882. In 1885 he traveled in America and Europe. He served as Ambassador to the United States in 1888-90, and then, returning to Japan, held the portfolio of Agriculture and Commerce. From 1892 to 1896 he was Minister of Foreign Affairs in the cabinet of Marquis Ito. In 1894 he obtained a treaty with Great Britain, in which the latter gave up the privilege of extraterritorial jurisdiction in Japan, and for this service he was made Count.

MUTSUHITO, *mut'su-hē'tō* or *mut-t-sē'tō*
See **MEIJI TENNO**.

MUTTON BIRD. See **SHEARWATER**

MUTTON FISH. 1. A fish of the large, widespread group of eelpouts, the eelpout or mother of eels (*Zoarces anguillar*) of the North Atlantic coasts. It feeds upon shellfish, may be caught with a hook in the bays north of Cape Cod, and reaches a weight of six to seven pounds. It spawns in late summer and produces a few large eggs. 2. One of the snappers (*Ncomenis analis*) of the West Indies. 3. One of the mojarras (*Gerrus olithostomus*), also called Irish pompano. See **MOJARRA**.

MUTTRA. The capital of a district of the same name, in the United Provinces, British India, 30 miles northwest of Agra, on the right bank of the Jumna (Map: India, C 3). The city extends in crescent form for about 1½ miles along the right bank of the river, to which access is facilitated from a paved street by numerous ghats and chatburahs, ornamented with pavilions and temples. It is one of the great pilgrim resorts of India, and the devotional ablutionary exercises of the mixed crowds morning and evening constitute one of the characteristic sights of the city. The part of the city known as Braj Mandal is sacred to the memory of Krishna. Ravines intersect the town, though the streets are wider and straighter than in most Indian towns. The Hardinge, or Holī entrance gate, is a notable

monument, and the houses of some of the wealthier native class are adorned with fine sculptures. There are numerous mosques and temples. The mosque of Aurungzebe is the oldest, dating from 1669. Among interesting remains are the ruins of Akbar's fort, centrally situated on the river bank, and the observatory built by the celebrated astronomer Jey Singh, who became Prince of Amber in 1693, still containing several astronomical instruments. Modern features are the museum, with an extraordinary collection of ancient sculptures unearthed at Muttra, botanical gardens, the European churches, and the extensive military cantonments to the south of the city. As early as the fourth century Muttra is mentioned as a centre of Buddhism. As the reputed birthplace of Krishna and his brother Balarama, it is annually visited by thousands of pilgrims on the occasions of its religious festivals. The river abounds with turtles, and the streets swarm with monkeys, peacocks, parakeets, and sacred bulls, which are permitted to roam at large, protected and fed by the people. Muttra anciently was of great importance, and its splendor and wealth made it an object of attack to the first Afghan invaders. Mahmud of Ghazni in 1017 plundered and burned the city and carried off idols of gold, silver, and precious stones valued at \$15,000,000. In 1500, 1636, 1669, and 1756, it again suffered capture and spoliation. Since the British occupation in 1803 it has regained some of its former importance. During the Indian Mutiny of 1857 the Sepoys here murdered their British officers and joined the insurgents at Delhi. Muttra is increasing in commercial importance. It is a large banking centre, manufactures blank books and brass idols, has cotton gins and compresses, and has a large trade in sugar, cotton, grain, and metals. Pop., 1901, 60,042. 1911, 58,183.

MUTUALISM (from *mutual*, from OF *mutu*, from Lat *mutuus*, reciprocal, from *mutare*, to change). That type of symbiosis (q.v.) in which each symbiont is believed to gain by the presence of the other. It has not been absolutely proved that a case of complete mutualism exists, though in the root tubercles (q.v.) of the Leguminosae the evidence for mutualism is very strong.

MUTULE (Lat. *mutulus*, bracket, mutule, modillion). A rectangular block under the corona, or projecting portion, of the cornice of the Doric order. One is regularly placed over each triglyph and metope. On each mutule are worked three rows of six *guttae* or drops. They probably represent the heads of the nails by which the wooden block (forerunner of the mutule) was fastened in the primitive brick and wood style from which the Doric order developed. Consult A. Marquand, *Greek Architecture* (New York, 1909).

MUTUUM, mŭ'tŭ-ŭm (Lat., loan). A loan of any article or commodity for consumption by the borrower, who agrees to return the article in kind. The term and the rules governing such contracts originated in the Roman law, and were adopted into the English and Scots law at an early period and became a part of the common law. A mutuuum is not a true bailment, as the article itself is not to be returned; and it does not create a debt, as no money payment is to be made. The title to the commodity lent passes to the borrower, and therefore it seems like a contradiction in terms to employ the termi-

nology of bailments to such contracts. It has been held in a few States that the delivery of grain to a miller for grinding is a contract of mutuuum, and that the miller is only bound to return flour of the same quality that the grain delivered would have produced. The important effect of this doctrine on such a state of facts would be that the miller would still be bound to deliver the flour if the grain were destroyed. Consult Story, *Bailments*.

MUYBRIDGE, EADWEARD (1830-1904). A photographer whose work made possible the development of the moving picture (q.v.). His name was originally Edward James Muggeridge. Born at Kingston-on-Thames, England, he early removed to the United States, where he became director of photographic surveys for the national government. In 1870, by a series of negatives of a horse trotting, he demonstrated that in this kind of movement there is a moment when all the feet are off the ground, thus settling an old controversy. Muybridge made experiments on the stud-farm of Senator Leland Stanford at Palo Alto, Cal., and gradually widened the scope of his studies. In 1881 a machine invented by him and called the zoopraxiscope reproduced on a screen horse races, the flight of birds, and athletic contests. The same year he lectured before the electrical congress in Paris, and in London he spoke before both the Royal Institution and the Royal Society. When in England Muybridge lived at Kingston, and it was there that he died. He published: *The Horse in Motion* (1878). *Animal Locomotion* (11 vols., 100,000 photographic plates, 1887), abridged and divided as *Animals in Motion* (1899, 3d ed., 1907) and *The Human Figure in Motion* (1901, 3d ed., 1907).

MUYSCA, mu-ě'skă. A confederacy of South American Indians. See CHIBCHA.

MUZAFFAR ED DIN, mŭz-ză'fēr ēd dēn' (1853-1907). Shah of Persia, the second son of Nasr ed Din (q.v.). He was born at Teheran, March 25, 1853. He was appointed Governor of the Province of Azerbaijan, but was recalled for failing to suppress an uprising of the Kurds. Already declared heir apparent during his father's lifetime, Muzaffar ed Din became Shah June 8, 1896, after Nasr ed Din's assassination by a Babi (see BABISM) on May 1. In early life a fanatical Mohammedan, he showed great tolerance as Shah, particularly in his repression of an outbreak against the Christian Armenians at Kazoni in 1899. At his accession he further relieved his subjects of the taxes on meat and bread and likewise abolished the system of purchase of civil and military positions. European influences, especially those of the English and Russians, were responsible for his changed attitude. He visited Europe in 1900, 1902, and 1905. In 1906 he made the first step towards establishing a parliamentary government by summoning a partially elective National Assembly. See PERSIA.

MUZAFFARPUR, mŭz'ăf-ēr-pŭr'. The capital of a district in Bengal, British India, on the right bank of the Little Gandak River, 37 miles northeast of Patna (Map: India, E 3). It is a well-built town with a numerous attended high school, a college (established in 1899), and a German mission. In its jail are manufactured castor oil, carpets, aloe fibre and cloth. Saltpetre is largely mined in the district, and there is a considerable trade in indigo and saltpetre. Pop., 1901, 45,617.

MUZÁKOVÁ, mŭ'zhā-kō-vā, JOHANNA (1830-99). A Bohemian novelist, known by her pseudonym, Karolina Světlá. She was born at Prague, and her name was Rott before she married Professor Mužák. After 1858, when her first novel, *Double Awakening*, was published, she produced more than 50 works of fiction, such as *Láska k básníkovi* (Poet's Love, 1860); *První Češka* (First Czech Woman, 1861); *Vesnický román* (Village Romance, 1869; Ger. trans. by Alexia, 1900); *Frantína* (1870); *Kříž a potoka* (The Cross beside the Stream, 1868); *Barbara* (1873); besides essays, memoirs, and songs. Mužáková is at her best in novels and sketches dealing with Czech village life. Many of these have been translated into French, German, and other languages. Her collected works appeared at Prague in six volumes (1892-94). —Her younger sister, SOFIA (PODLIPSKÁ) (1833-97), was a writer of historical romances.

MUZIANO, mŭō'tsē-ā'nō, GIROLAMO (1528-92). An Italian painter of the Mannerist school. He was born at Aquafredda, near Brescia, whence he was also called Bressano. He was a pupil of Girolamo Romanino, and afterward studied in Venice. Proceeding to Rome, he adopted the manner of Michelangelo, whose favor he gained by his first painting of importance, "The Resurrection of Lazarus," now in the Quirinal Palace. He is best known for his improvement of mosaics and the foundation of the Academy of St. Luke, which was largely due to his efforts and endowment. He was also celebrated among contemporaries for his landscapes. Most of his pictures are in the palaces and churches of Rome. Among the best are "Christ Giving the Keys to Peter" and "St. Jerome Preaching," both in Santa Maria degli Angeli, and the "Circumcision" in the church of the Gesù. Though an imitator of Michelangelo, he preserved some of the excellences of Venetian coloring.

MWERU. See MOERO.

MWUTAN-NZIGE, mwōō'tān-n'zē'gā. See LAKE ALBERT.

MYA, mī'ā. See CLAM.

MYALGIA, mī-ā'l'jī-ā (Gk *mŭs, mys*, muscle + *ἄλγος, algos*, pain). See RHEUMATISM, MUSCULAR.

MY'ALI'NA (Neo-Lat., dim. of Lat. *mya*, from Gk. *μύαξ, myaw*, sea mussel, from *mŭs, mys*, muscle, mussel, mouse). A fossil pelecypod somewhat resembling in shape a mussel (*Mytilus*), that is very common in the Carboniferous and Permian rocks, and hence an index fossil of those periods. The genus is of interest also as possibly representing an intermediate stage between the *Aviculidæ* and *Mytilidæ*, with both of which families it has characters in common.

MYCALE, mīk'ā-lē (Lat., from Gk. *Μυκάλη, Mykalē*). The ancient name of a mountain, now called Samsun, in south Ionia, Asia Minor (Map. Greece, Ancient, E 3). It terminates in the promontory of Cape Santa Maria, opposite Samos. To the shore of this promontory the fleet and army of Xerxes withdrew in 479 B.C. on the news of the approach of a Greek fleet. The Greeks under the Spartan King Leotychides and the Athenian Xanthippus, father of Pericles, followed them, landed, and after a severe struggle stormed the Persian camp and burned the ships.

MYCELIUM (Neo-Lat., from Gk. *μύκης, mykēs*, fungus + *ἦλος, hēlos*, nail, wart). The

characteristic vegetative body of the true fungi. In general it consists of branching, more or less interwoven filaments (hyphæ), which in some cases include a continuous cavity (cœnocyctic), and in other cases have cross walls (septate). The mycelium may be very open and delicate, or it may be feltlike, or even form a compact body, as in lichens. The mycelium establishes absorbing connections with its food supply (substratum), and when these connections are definite and more or less specialized, they are called haustoria (suckers). In the case of a parasite the substratum is either the surface or the internal tissues of the host. The mycelium also produces vertical branches (sporophores), which in a variety of ways give rise to spores. See FUNGI.

MYCENÆ (Lat., from Gk. *Μυκῆναι, Mykēnai*). An ancient city of Greece, on a steep hill in the northeast corner of the Argolic Plain, commanding the passes towards Corinth (Map. Greece, Ancient, C 3). It was said to have been founded by Perseus and to have been ruled by his descendants until they were superseded by Pelops. It is celebrated in legend as the capital of Agamemnon. Here was laid the scene of the terrible story of the house of Atreus, and here was stored the wealth of Agamemnon. After the epic period the city seems to have been completely overshadowed by the power of Argos, but it still preserved a quasi independence, for during the Persian wars, when Argos was friendly to Persia, we hear of 80 Mycenæans at Thermopylæ (479 B.C.), and along with Tiryns it sent 200 men to Platæa. Later Mycenæ joined the Spartan League, but when the Spartans were occupied by the revolt of the Helots, in 463 B.C., the Argives besieged the city and expelled the inhabitants. From that time the place was the seat of a small village community, who in the time of Pausanias showed visitors the graves of Agamemnon and his household. The destruction of the city by the Argives did not greatly injure the massive Cyclopean wall, and this fortification, still preserved to a considerable height, with the Lion Gate (q.v.), so called from the reliefs on the triangular slab over the lintel, and the domed tomb outside, commonly called the Treasury of Atreus, had attracted the attention of archaeologists long before Heinrich Schliemann (q.v.) in 1876 began his excavations. These opened an entirely new field in Greek archaeology by the discovery just inside the Lion Gate of a carefully inclosed circle, evidently a sacred inclosure, within which at a considerable depth were five shaft graves, hewn in the rock, and containing a number of bodies, with an extraordinary mass of gold and silver ornaments, swords, and vases. These are now in the National Museum at Athens. Over one grave was a small circular altar. Since that time the Greek Archaeological Society has continued the excavations, for the most part through Dr. Chrestos Tsountas, whose accurate and careful methods have proved highly successful. Besides the Treasury of Atreus eight other domed tombs and a very large number of smaller rock-cut chambers for burial have been opened. Within the wall a sixth grave was discovered near the others, the foundation walls of smaller houses were laid bare, while near the summit of the Acropolis were found the ruins of a palace showing great similarity to a palace at Tiryns. The discoveries at this site first brought into

prominence that special period of Ægean civilization which preceded the historic Hellenic culture, and hence the name Mycenæan has been given to this age and civilization. For the general characteristics of Mycenæan art and for illustrations, see ARCHÆOLOGY, III, *Mycenæan Period*, ATREUS, TREASURY OF.

Hall, *The Ancient History of the Near East* (London, 1913); id., *Ægean Archaeology* (ib., 1915).

MYCENÆAN (mī'sē-nē'an) PERIOD. See ARCHÆOLOGY.

MY'CERINUS. An Egyptian king, the sixth of the fourth dynasty. His name, written by Herodotus as above and by Diodorus as Mecherinus, is, following the Egyptian form, Menkaura. He built a pyramid southwest of Ghizeh, the third in size and the first in point of preservation. In it in 1837 were found his stone sarcophagus (afterward lost at sea) and fragments of his wooden coffin. Mycerinus was famed for his piety. He is the subject of one of the early poems of Matthew Arnold.

MY'CETO'MA. See MADURA FOOT.

MY'CETOZO'A (Neo-Lat. nom. pl., from Gk. *μύκης*, *mykēs*, fungus + *ζῷον*, *zōon*, animal). A name given to the Myxomycetes (qv) by those who regard them as animals rather than plants. See PROTOZOA.

MYCONIUS. See MYKONIUS.

MY'COPHYLAX'INS. See IMMUNITY.

MY'CORRHIZA (Neo-Lat., from Gk. *μύκης*, *mykēs*, fungus + *ρίζα*, *rhiza*, root). The whole structure formed by the intimate association of certain fungi with the roots of higher plants. The fungi either grow inside the cells of the cortex (endotrophic mycorrhiza) or invest the young absorbing portions of the roots with a jacket of interwoven hyphae (ectotrophic mycorrhiza, Fig. b). Recent investigations have shown that mycorrhizal fungi are very widespread and that they are associated with perhaps more than half of the higher plants. They are particularly abundant in humus, and the conclusion has been reached that a large number of humus plants are very much benefited by their presence, and further, that some plants, such as the Indian pipe, certain orchids, and even the European beech tree, are unable to complete their normal life cycle in sterilized soil. There are apparently all degrees of interdependence between these fungi and higher plants, ranging from an occasional temporary infection, through stages where there is a regular annual development of the mycorrhiza upon many or all of the roots, as seen on such forest trees as many of the oaks, the hickories, and the basswood, to very close and perpetual unions of the two organisms, extending from the earliest development of the seedlings throughout the entire life of the higher plant.

The English heather (*Calluna vulgaris*) has recently been found to furnish an interesting example of highly specialized mycorrhiza. The

fungus is present in the testa of the seed and infects the seedling immediately after germination. Should such an infection fail, as in experimental sterile cultures, the seedlings fail to develop roots, although they may live for several weeks. The fungus persists during the entire life of the heather plant and is present not only in the roots but also in the stem, flowers, and fruit, although limited to the testa in the seed. A similar dependence upon such

MYCORRHIZA

a, root and rootlets of *Carpinus betulus*, showing the coralloid character of mycorrhiza.
b, end of root of the beech (*Fagus sylvatica*), showing mat of fungus threads, more highly magnified than a.

fungi is found in many epiphytic orchids, most of which do not thrive in the absence of the mycorrhiza, while in many the seedlings develop only when infected by the fungus. This explains the practice among gardeners of sowing orchid seeds among the roots of orchid plants. Several of the mycorrhizal fungi have been identified as the mycelial stages of large fleshy fungi belonging to the genera *Agaricus*, *Russula*, *Scleroderma*, and *Phoma*.

The physiological relation between the fungus and the higher plants is still very imperfectly known. It is believed that often by its digestive powers the fungus secures and prepares certain foodstuffs, especially those containing nitrogen, and that eventually the higher plants use and benefit by these nitrates. The fungus may also to a certain extent aid in the absorption of the water used by the higher plant. Doubtless in many instances, however, the fungus is simply parasitic upon the roots of its host, getting from it carbohydrate foods. Con-

B. McDougall, "Mycorrhiza of Forest Trees," in *American Journal of Botany*, vol. i (Lancaster, Pa., 1914); Rayner, "Obligate Symbiosis in *Calluna Vulgaris*," in *Annals of Botany*, vol. xxix (London, 1915). See SYMBIOSIS

MY'COZO'ZINS. See IMMUNITY

MYD'DELTON, or **MIDDLETON,** SIR HUGH (c 1560-1631). A British contractor, born at Galsch Hill, Denbigh, Wales. He became a London goldsmith and banker, engaged in various commercial undertakings, and was a member of Parliament from 1603 to 1628. In 1609 Myddelton began work on the New River, a canal for supplying London with water from springs in Hertfordshire. He obtained aid from King James in the undertaking in 1612, and in the following year had completed the work. The project greatly impoverished Myddelton, as it returned no profit till 1633. He was created Baronet in 1622. Consult Samuel Smiles, *Lucas of the Engineers* (new ed., London, 1904)

MYD'RIATICS (Gk. *μυδρίασις*, *mydriasis*, undue enlargement of the pupil of the eye, + suffix *-atic*, pertaining to). Drugs which produce dilatation of the pupil of the eye. Many of them also produce cycloplegia, i.e., paralysis of the ciliary muscle, which controls accommodation. The principal mydriatics for examination of the eye are atropin, homatropin, and cocaine, others less used are hyoscyamin, duboisin, daturin, scopolomin, muscarin, mydin, euphthalm, and ephedrin. Atropin is the typical mydriatic, and acts by paralyzing the sphincter of the pupil, at the same time stimulating the dilator. It paralyzes the ciliary muscle completely. Drugs which contract the pupil are called miotics (q v).

MYELAT, mē'a-lāt (Bur., unoccupied country). A division of Burma, India, comprising 16 of the southern Shan States. Total area, 3723 square miles. The region is sparsely populated. The chief industry is the cultivation of rice and sugar cane. Pop., 1901, 119,415

MYELITIS (Neo-Lat., from Gk. *μυελός*, *myelos*, marrow). An inflammation of the substance of the spinal cord which may be limited to the white or the gray matter or involve the whole cord or isolated portions of it. When the white matter is inflamed with the meninges it is called cortical myelitis; when the gray matter only is affected it is known as central myelitis. The disease may extend transversely, or may proceed in an upward or downward direction. The causes are, in general, injuries of various kinds, exposure, and overexertion; the infectious diseases, such as measles, typhus fever, and smallpox, rheumatism or syphilis, mercurial or arsenical poisoning; and caries or tumors of the spine or the cord itself. The symptoms depend upon the extent and location of the inflammatory process. A transverse myelitis, e.g., produces paraplegia, or complete paralysis of all the voluntary muscles whose nerve fibres arise from nuclei below the seat of the lesion. There are rectal and vesical paralysis, girdle pains, bedsores, and disturbances of sensation. Treatment is en-

tirely symptomatic. The prospects of recovery are bad in myelitis, particularly in the ascending form and that variety involving the trophic centres. In some mild cases the patients recover completely, in others only partly.

In children a specific form of the disease attacks the anterior horns of the gray matter (when it is called *poliomyelitis*, or infantile spinal paralysis). See POLIOMYELITIS

MYER, ALBERT JAMES (1827-80). An American army officer and meteorologist, born at Newburgh, N. Y. He graduated at Hobart College and took his degree in medicine at the Buffalo Medical College in 1851. In 1854 he was appointed assistant surgeon in the United States army and was assigned to Texas, where he first developed his celebrated signal system of flags by day and torches by night, which afterward came into general use. In 1860 he was commissioned major and made chief signal officer of the army. On the outbreak of the Civil War he was made signal officer on the staff of General Butler and afterward on that of General McClellan, and was successively brevetted lieutenant colonel, colonel, and brigadier general, his last promotion being for distinguished services in organizing, instructing, and commanding the signal corps of the army and for especial service on Oct. 5, 1864, at Allatoona, Ga., where his signal system enabled the apparently doomed garrison to summon assistance from the main army. On July 28, 1866, he was made colonel in the regular army and chief signal officer. In 1870 the signal corps, under his direction, commenced observing and giving notice by telegraph of the approach and force of storms on the northern lakes and seacoast, at the military posts in the interior, and at other points in the States and Territories. In 1873 Myer organized, and thereafter promoted, international simultaneous daily meteorological observations, published as daily bulletins with maps. He published *A Manual of Signals for the United States Army and Navy* (1868). A short time before his death he was promoted to the full rank of brigadier general of the United States army.

MYER, FORT. See FORT MYER

MYERS, CORTLAND (ROOSA) (1864-). An American Baptist clergyman. He was born at Kingston, N. Y., graduated from the University of Rochester in 1887 and from the Rochester Theological Seminary in 1890, and served as pastor of the First Church, Syracuse, N. Y. (1890-93), of the First Church, Brooklyn (1893-1909), and thereafter of Tremont Temple, Boston. He received the degree of D.D. from Temple University, Philadelphia, in 1899. His writings include *The Best Place on Earth* (1893), *American Guns* (1898), *Why Do Men not Go to Church?* (1899), *Making a Life* (1900, 2d ed., 1913), *The New Evangelism* (1903), *The Boy Jesus* (1908), *Real Prayer* (1911), *When Heaven Touched the Earth* (1912).

MYERS, FREDERIC WILLIAM HENRY (1843-1901). An English poet and essayist, born Feb. 6, 1843, at Keswick, where his father was incumbent of St John's Church. He was educated at Cheltenham and at Trinity College, Cambridge, graduating with distinction and gaining a fellowship in his college (1865). His taste for poetry was shown in his boyhood. He delighted in Homer, Æschylus, Lucretius, in fragments of Sappho, and in Pindar. Before quitting school he had learned all Vergil by heart. He was for many years inspector of

schools. In 1882 he took an active part in founding the Society for Psychical Research, of which he became president. He died in Rome, Jan. 17, 1901. The verse of Myers, which belongs mostly to an early period, comprises *St. Paul* (1867); *Poems* (1870); *Renewal of Youth* (1882). In these collections are pieces of rare beauty, which give the author one of the first places among the lesser poets. Myers undoubtedly wrote some of the finest essays of his time in *Essays Classical and Modern* (1883) and in *Science and a Future Life* (1893). He also prepared for the "English Men of Letters Series" an admirable *Life of Wordsworth* (1881). His work in psychical research is represented by his contributions to the *Phantasms of the Living* (1886), which embodied the first considerable results of the labors of the Society for Psychical Research. After his death appeared a book on the evidences of immortality entitled *Human Personality and its Survival of Bodily Death*, edited by R. Hodgson and A. Johnson (London, 1903), and *Fragments of Prose and Poetry* (1904). Consult the *Athenæum* (London, Jan. 26, 1901), A. C. Benson, *The Leaves of the Tree* (New York, 1911).

MYERS, HENRY L. (1862-). An American legislator. He was born in Cooper Co., Mo., was educated in local schools, and practiced law at Boonville and West Plains, Mo., from 1885 to 1893. Moving to Hamilton, Mont., in the latter year, he was prosecuting attorney for Ravalli County in 1895-99, Democratic member of the Montana Senate from 1899 to 1903, and district judge of the fourth judicial district of Montana in 1907-11. He was elected United States Senator for the term 1911-17.

MYERS, JEROME (1867-). An American figure and landscape painter. He was born in Petersburg, Va., and studied at the art school of Cooper Union and the Art Students League, New York. Myers is best known for his street scenes of New York, especially of the lower East Side. His execution is careful, with moderate color schemes and little contrast of light and shade. An example of his work is "The Night Mission," in the Metropolitan Museum of Art.

MYERS, PHILIP VAN NESS (1846-). An American historian, born at Tribes Hill, N. Y. He graduated at Williams College in 1871 and studied at Yale Law School (1873-74). After two years in Europe he returned to the United States and became president of Farmers' College, Ohio, in 1879. From 1890 to 1900 he was professor of history and political economy at the University of Cincinnati, where he was also dean of the academic faculty in 1895-97. His publications include *Life and Nature under the Tropics* (1871); *Remains of Lost Empires* (1875); *Ancient History* (1882, rev. ed., 1904); *Medieval and Modern History* (1889, new ed., 1905); *General History* (1889, rev. ed., 1906); *The Eastern Nations and Greece* (1890; rev. ed., 1904); *History of Rome* (1890); *History of Greece* (1897); *Rome: Its Rise and Fall* (1900; new ed., 1905); *The Middle Ages* (1902); *The Modern Age* (1903); *History as Past Ethics* (1913). Certain of his works became standard textbooks in high schools and colleges.

MYHRMAN, mēr'mān, DAVID WILHELM (1866-). A Swedish Orientalist, born in Tuna, Kalmar. In 1892 he went to America and studied at Chicago University and at Harvard. In 1902, having taken the degree of Ph.D. at Leipzig, he was appointed docent in Assyriology at

Upsala. Besides articles contributed to encyclopædias and periodicals he published: *Die Labartu-Texte* (1902); *Ur babyloniermas och assyriernas religionslitteratur* (1908); *Kitāb mu'id an-n'iam* (1908); *Aramaic Incantation Text* (1910); *Babel och Bibel* (1911); *Nouveaux noms propres* (1911); *Babylonian Hymns and Prayers* (1911); *Tusen natter och en natt* (1912); *Upptäckterna i Babylonien och Assyrien* (1913). He was co-editor of *Babylonica* (Paris) and *Babylonian Expedition* (University of Pennsylvania).

MYIASIS, mī-yā'sis (Neo-Lat., from Gk. *μύια*, *myia*, fly). A medical term for the state of being infested with the larvæ of dipterous insects. A rather large number of flies may infest human beings in this way, and the disease has been divided according as the larvæ are found in the skin, in the ear, in the conjunctiva, in the intestines, in the mucous membranes, in the nose, or in wounds. The most common form is the presence of the larvæ of flesh flies, or blowflies, in open and neglected wounds. In certain portions of the United States, the screw-worm fly (*Lucilia macellaria*) deposits its eggs or larvæ not only in open sores upon the bodies of men and women, but many cases are on record where the eggs have been deposited in the nostrils of persons sleeping exposed in the daytime. These flies are especially apt to be attracted by an offensive catarrhal condition. Scores of maggots have been taken from the nasal passages of such individuals, and a complete destruction of the soft palate has been brought about in this way. The European flesh fly known as *Sarcophila wohlfarti* has been reared from larvæ found in numbers in the nasal cavities and in the ear of man. *Lucilia nobilis* of Europe has also been reared from the ear of a man, causing extensive discharges and much putrefaction. The bluebottle fly (*Calliphora vomitoria*) sometimes causes nasal myiasis, and the common flesh fly (*Sarcophaga carnaria*) has been reared from larvæ found in the nasal passages. There are also cases of myiasis of the vagina. In all of these instances the flies are either Sarcophagidæ or Muscidæ, and the adults were attracted to putrid or septic wounds or to an offensive or purulent discharge from the body, depositing their eggs or larvæ therein. Internal myiasis is nearly always caused by the larvæ or flies of the family Anthomyiæ. These flies deposit their eggs in spoiled vegetables, which are afterward eaten in the raw state, as in salads. The larvæ of several species have been passed while still alive, and frequently cause intestinal disturbances of a more or less serious character. *Homalomyia canicularis*, e.g., has several times been reared in this way. In the family Sepsidæ the common cheese maggot (larva of *Prophila casei*), taken into the stomach with old cheese, has been found alive in excreta, having passed through the entire alimentary canal. Cutaneous myiasis, aside from that of open wounds, is produced by several of the botflies of the family Eristidæ. In tropical regions there are one or more species of the genus *Dermatobia*, which may lay their eggs upon the skin of human beings, the resulting maggot forming a pus sac below the surface of the skin and, if undisturbed, reaching its full growth in this situation. Such cases as this are not uncommon among the unclothed inhabitants of tropical countries, and persons while bathing occasionally become infested. The best known of these human botflies is *Dermatobia cyaneiventris*, common in South America.

MYKONIUS (properly MEKUM), **FRIEDRICH** (1490-1546). A German theologian of the Reformation. He was born at Lichtenfels in Upper Franconia. At 19 he entered a Franciscan cloister at Annaberg and in 1516 became a priest. In the following year Mykonius embraced Luther's teachings, and about 1524, as pastor of a church at Gotha, became one of the leaders of the Reformation. He rendered especially valuable service in Thuringia and, after 1539, in Leipzig, by reviving the primitive custom of episcopal visits to the different churches. He attended several of the conferences of the Reformation period and in 1538 was sent to England to discuss the articles of the Augsburg Confession. Mykonius' *Historia Reformationis* (1517-42), which contains much autobiographic matter, was published in 1715. Consult Ledderhose, *Friedrich Mykonius* (Gotha, 1854), and the biography by Meurer in his *Altvater der lutherischen Kirche* (Leipzig, 1864).

MYKONIUS, **OSWALD** (1488-1552). A Swiss reformer and friend of Zwingli. His real name was Oswald Geishüsler. He was born at Lucerne, studied and taught at Basel, then lived for three years (1516-19) at Zurich. After teaching at Lucerne and Einsiedeln he returned to Zurich (1523). About 1532 Mykonius became pastor at Basel, and was soon elected to succeed Ecclampadius as antistes of the district and professor of theology, a choice which met with Erasmus' disapproval. His great labor was the reform of the Swiss schools. In theology he mediated the views of Luther and Zwingli on the nature of the Lord's Supper, and finally came to a mystic interpretation of it. He wrote *De H. Zwingli Vita et Obitu* (1532) and a commentary on Mark's Gospel (1538). Consult Hagenbach, *Oekolampad und Oswald Mykonius, die Reformatoren Basels* (Elberfeld, 1859).

MYLITTA. The name of a Babylonian goddess, according to Herodotus (1, 131, 199). She is identified with Aphrodite. In her honor sacred prostitution is practiced. When a stranger throws his money into the lap of the woman he has chosen, he utters a prayer that Mylitta may be with her. Mylitta is *Mulittu*, from *Mu'allhattu*, probably identical with Hebrew *meyalledeth* (midwife), and designates Ishtar (q.v.) as the goddess assisting women in childbirth. It is not a corruption of Belit, as has been often supposed. Consult: P. Jensen, *Die Kosmologie der Babylonier* (Strassburg, 1890); Zimmern, in Eberhard Schrader, *Die Keilschriften und das Alte Testament* (3d ed., Berlin, 1902), E. S. Hartland, "Concerning the Rite at the Temple of Mylitta," in *Anthropological Essays* (Oxford, 1907).

MYLIUS-ERICHSEN, mu'li-us-ä'rik-sen, LUDVIG (1872-1907). A Danish author, ethnologist, and explorer, born at Viborg. With Count Harald Moltke and K. Rasmussen (q.v.) he formed the Danish literary expedition (1902-04) to West Greenland, and in the early stages (1902) discovered near Evigheds Fjord two ice-free mountain ranges. Later the party proceeded to Cape York and for 10 months lived native fashion with the Eskimo. The return journey of the expedition to Upernivik across the ice of Melville Bay was the first sledge crossing on record. As commander of the *Danmark* expedition (1905-07) Mylius-Erichsen undertook and carried out the task—considered by many to be impossible—of exploring and charting the entire coast line of unknown northeast Greenland by

three months' field work. The expedition made sledge journeys of more than 4000 miles, exceeding the record of any other single Arctic force. The main travel, excluding duplications, of Koch was some 1250 miles, and that of Mylius-Erichsen must have exceeded 1000 miles. Their explorations showed that Peary's chart of a coast trending southeast from Navy Cliff was radically incorrect. Instead, the shore ran to the northeast, adding about 100,000 square miles to Greenland and extending it about halfway from Navy Cliff—where the maps wrongly placed Greenland Sea—to Spitzbergen. Mylius-Erichsen's own exploration disclosed the nonexistence of Peary's Channel, and thus established the continuity of Greenland from Cape Farewell, 60° N, to the most northern land ever reached, 83° 39' N. He also discovered and explored the great fiords of Denmark, Hagen, and Brönlund. Misled by existing maps, Mylius-Erichsen with Hagen and Brönlund so prolonged his journey that a return to the ship was impossible, and they perished of starvation, exhaustion, and cold. Mylius-Erichsen's observation journals, left at Denmark Fjord, were brought to Copenhagen by Ejnar Mikkelsen (q.v.) in 1912. Mylius-Erichsen wrote *Talte* (1898), a drama, *Vesthyder* (1900), tales, *Den gydske Hede for og nu* (1903); *Isblink* (1904), poems from Greenland, *Gronland* (1906). Report on nonexistence of Peary Channel in *Meddelelser om Gronland*, vol. xli (1913), edited by Ejnar Mikkelsen. Consult: Achton Friis, *Danmark-Expeditionen til Gronlands Nordostkyst* (1909). Geely, *True Tales of Arctic Heroism* (New York, 1912); Rasmussen, *People of the Polar North* (Philadelphia, 1908); G. C. Amdrup, *Report on the Denmark Expedition to the North-East Coast of Greenland* (Copenhagen, 1913).

MYLODON (Neo-Lat., from Gk. μύλον, *mylōn*, mill, millstone + ὀδός, *odous*, tooth). A gigantic extinct edentate mammal, allied to *Megatherium* and *Megalonyx*, found in the Pleistocene deposits of North and South America. See **MEGATHERIUM**.

MYNA, or **MYNA BIRD** (Hind. *māna*, starling). A member of any one of several closely allied genera in the starling family Sturnidæ. The common myna (*Acridotheres tristis*) is abundant throughout the Indian region, and has been introduced into the Hawaiian Islands and elsewhere where it thrives. It is 10 inches long, has the upper parts, breast, and sides brown, head and neck black, while there is a bare patch of yellow behind the eye. The wings are bound with white, the lower parts are white, and the bill is yellow. It is a ground-living species, going in large flocks and feeding on insects. The myna has a great variety of notes, some harsh, others pleasing. The loosely built nest is placed in a hole in a house or a tree, five eggs are laid. See **HILL MYNA**.

MY NOVEL; OR VARIETIES IN ENGLISH LIFE. A novel by E. Bulwer-Lytton (1853). The story, told by P. Caxton, is partly of Hazelden and partly of London. The principal hero is Harley L'Estrange, witty and brilliant, the friend of Squire Hazelden.

MYNSTER, mun'stēr, JACOB PETER (1775-1854). A Danish bishop, born in Copenhagen. He graduated with honors and was pastor at Spjellerup (1802-11). In essays, sermons, and treatises he declared open war on rationalism. As chaplain in Copenhagen (1811-28) he gathered large congregations and won fame. He re-

fused a professorship in Christiania and tutorship to the Crown Prince, gained the doctorate in theology (1815), and became royal confessor and pastor of the royal castle (1828). His *Betragtninger over de kristelige Troselærdomme* (1833) was very extensively read. In 1834 he was appointed Bishop of Zealand. The movement started by Grundtvig and the Christian laity for greater freedom within the Church he tried, without success, to check. Consult H. H. L. Schwanenflugel, *J. P. Mynster* (2 vols., Copenhagen, 1900-01).

MYOCARDITIS (Neo-Lat., from *myocardium*, from Gk. *mūs*, *mys*, muscle, mouse + *kardia*, *kardia*, heart). An inflammatory affection of the wall of the heart. It is a term first used by Sobernheim in 1837. Acute myocarditis is considered as an inflammation due to infection. It is a disease secondary to typhoid fever, diphtheria, scarlet fever, cerebrospinal meningitis, variola, erysipelas, malaria, rheumatism, influenza, or septicæmia. Chronic myocarditis, an insidious affection, pathologically an "interstitial fibrosis," is due to sclerosis of the coronary arteries, which supply the heart muscle with blood. See HEART, DISEASES OF.

MYOLEMMA (Neo-Lat., from Gk. *mūs*, *mys*, muscle + *λέμμα*, *lenmma*, skin). See MUSCLE AND MUSCULAR TISSUE, *Striated Voluntary Muscles*.

MYOMA, mi-ô-mâ. See TUMOR.

MYOMANCY. See SUPERSTITION.

MYOMORPHIA. See RODENTIA.

MYOPHORIA. A genus of important Triassic fossils, with smooth or radially sculptured shells and strong radial ridge extending backward from the beaks. There are two teeth in one and three teeth in the other valve. The genus forms a connecting series from the Permian schizodus to the highly sculptured and beautiful trigonias of the Jurassic and Cretaceous periods. See PELECYPODA.

MYOPIA, mi-ô-pi-â (Neo-Lat., from Lat. *myops*, from Gk. *μῦψ*, shortsighted, from *μῦειν*, *myein*, to close + *ὤψ*, *ôps*, eye). Short sight. A form of ametropia due to the fact that the anteroposterior axis of the eyeball is too long. Parallel rays of light, therefore, are not brought to a focus on the retina, but in front of it, forming circles of diffusion on the retina.

False or functional myopia may be brought about by spasm of the ciliary muscle, conical cornea, or swelling of the lens in incipient cataract. Myopia may be congenital, or may develop in weakly children from excessive application to study. Artists, engravers, students, and others using the eyes constantly for near work are often myopic. Excessive degrees of myopia are not unattended with dangers, among which may be enumerated detachment of the retina, the development of squint, vitreous opacities, changes in the choroid and retina, and serious impairment of vision, even when correcting lenses are worn. In what is termed malignant or progressive myopia the vitreous may become fluid, the lens dislocated, and the whole eyeball soft, total blindness being the ultimate result. See SIGHT, DEFECTS OF.

MYOSIN. See GLOBULINS.

MYOSITIS (from Gk. *mūs*, *mys*, *μῦς*, *myos*, muscle + *itis*). See MUSCLE, DISEASES OF.

MYOSOTIS. See FORGET-ME-NOT.

MYRAND, ERNEST (1854-). A Canadian author. He was born in the city of Quebec and was educated at Quebec Seminary and at

Laval University. He entered the Quebec civil service and later became an official in the department of the Provincial Secretary. In 1908 he was elected a fellow of the Royal Society of Canada, which awarded him a diploma of honor for his literary work. He published: *Une fête de Noël sous Jacques Cartier* (1888, 3d ed., 1911); *Sur William Phipps devant Québec, 1690* (1893), *M de la Colombyne, orateur* (1898); *Nœls anciens de la Nouvelle France* (1899, 2d ed., 1909), *Frontenac et ses amis* (1902); *Dialogues du paganisme, représentés aux fêtes du Tricentenaire de Québec en 1908* (1908).

MYRES, mîrz, JOHN LINTON (1860-). An English classical scholar, born at Preston, Lancashire. He was educated at Winchester School and at New College, Oxford, was tutor at Christ Church (1895-1907), professor of Greek and lecturer in ancient geography at the University of Liverpool (1907-10), and then professor of ancient history at Oxford. He traveled much in Greece and Asia Minor, and in 1894 conducted excavations in Cyprus. In addition he devoted much attention to anthropological studies. His publications include: *A Catalogue of the Cyprus Museum* (1899), with Dr. Ohnefalsch-Richter; *A History of Rome* (1902); *The Dawn of History* (1911), *Metroplitan Museum of Art Handbook of the Cernola Collection of Antiquities from Cyprus* (1914); and papers on Mediterranean anthropology, archaeology, and geography in various learned periodicals.

MYRIAPODA (Neo-Lat. nom. pl., from MGk. *μυρίαπους*, *myriopous*, having ten thousand feet, from Gk. *μύριοι*, *myrioi*, ten thousand + *πούς*, *pous*, foot). A class of arthropods resembling annelids in their lengthened form and in the great number of equal, or nearly equal, segments of which the body is composed, but in most of their other characters more nearly agreeing with insects, among which they were ranked by the earlier naturalists. They differ from insects and all other arthropods in the fact that the posterior segments of the body bear jointed locomotor appendages. In addition to their affinities with insects, myriapods are wormlike and some of them suggest relations with the thysanurans. They have a distinct head, but there is no distinction of the other segments, as in insects, into thorax and abdomen. They have simple or compound eyes; a few are destitute of eyes. They have antennæ like those of insects. The mouth is furnished with a complex masticating apparatus, in some resembling that of some insects in a larval state, in others similar to that of crustaceans. Respiration is carried on through minute pores or spiracles placed on each side along the entire length of the body, the air being distributed by innumerable ramifying air tubes to all parts. In most parts of their internal organization the myriapods resemble insects, although a decided inferiority is exhibited, particularly in the less perfect concentration of the nervous system. The resemblance is

FORMS OF MYRIAPODS

- 1, *Geophilus* 2, *Polydesmus*.
- 3, *Julus*

greater to insects in their larval than in their perfect state. The body of the myriapods is protected by a hard chitinous covering. The number of segments is various, seldom fewer than 24, although in some of the genera they are consolidated together in pairs, so that each pair, unless closely examined, might be considered as one segment bearing two pairs of feet. The legs of some of the lower kinds, as *Julus*, are very numerous, and may be regarded as intermediate between the bristle-like appendages which serve many annelids as organs of locomotion and the distinctly articulated legs of insects. In the higher myriapods, as *Scolopendra*, the legs are much fewer, and articulated like those of insects. Some of them feed on decaying organic matter, chiefly vegetable, those of higher organization are carnivorous. The myriapods do not undergo marked metamorphoses, but the young greatly resemble the adults, although some of them are at first quite destitute of feet, and, contrary to what takes place in insects, the body becomes more elongated as maturity is approached; the number of segments and of feet increase.

Myriapods are widely distributed and are represented in almost every part of the earth. They flourish in moist and dry, hot and cold climates. Like other widely distributed animals, they show great variation in size and color, ranging from microscopic size to a length of more than 6 inches. Some of the *Julidæ* and *Polydesmidæ* of the tropics are beautifully and brilliantly colored. Some of the species of *Geophilus* are phosphorescent. Most myriapods inhabit dark and obscure places. Some of the cave-inhabiting species from Wyandotte and Bradford caves in Indiana are described by Packard as light in color, and those from the latter cave have rudimentary eyes. The organs of defense throughout the class vary greatly. In the centipedes the large claws, supplied with poison from a gland, are weapons of offense and defense. The millipedes, on the other hand, rely for defense on an acid secretion from certain glands. Other forms are hairy or bristly. Hairiness was the most common mode of defense among fossil myriapods.

A fossil bristled myriapod has been found in America in Paleozoic strata, and two species have been found in the Old Red Sandstone of Scotland. The highest vertebrates in this deposit are fishes, and the highest plants are conifers. The Paleozoic species, about 40 in number, all belong to an extinct order (*Archipolypoda*), and most of them were of gigantic size. Later fossil myriapods, contemporaneous with giant fossil *Amphibia*, occur in the coal measures. One of these forms from Illinois approaches very closely the *Julidæ* of to-day. Only one species has been found in the chalk layers, but in Tertiary and recent times plentiful remains have been found. The majority of these belong to the *Chilognatha* and *Chilopoda*. They have been found in the gypsum of France, in the brown coal of Germany, and in the Green River formation of North America. Amber has also yielded several species.

Classification. The class Myriapoda is now divided into five orders, the *Chilognatha* or *Diplopoda*, the *Chilopoda* or *Syngnatha*, the *Schizotarsia*, the *Symphyla*, and the *Pauropoda*. To the *Chilopoda* belong the common thousand-legs of the family *Julidæ*, as well as the representatives of seven other families, all of which bear

two pairs of legs to each of the body segments except the first three. Verloef states that the males of some of the *Julidæ* undergo certain seasonal changes. In the spring and autumn the form of the legs and other organs changes. These seasonal changes are correlated with the sexual condition of the *Julus*, just as the males of certain birds and fishes show a brighter coloration and other changes at the breeding season. *Julus* will feed freely in captivity if the earth is kept at the proper moisture and proper food is furnished plentifully. They will thrive on grass, leaves, and bits of apple and pear. The eggs are numerous, from 60 to 100 being deposited at a laying. The female forms a receptacle for the eggs some distance below the surface of the ground. It is in the shape of a hollow sphere and is composed of little pellets of mud, which are molded by her jaws and front legs. The nest is perfectly smooth within, but the outside is rough and shows the pellet composition. In the top of the sphere a small opening is left until the eggs are laid. The hole is then plugged up with earth and the eggs are left to chance. The chilopods have many-jointed antennæ and only one pair of legs to each joint. To this group belong the large tropical centipedes of the family *Scolopendridæ* and the long slender *Geophilidæ*, as well as the *Lithobidæ* and *Notophilidæ*.

The order *Schizotarsia* contains but a single family, the *Scutigera*, of which the common household centipede of the United States (*Scutigera forcipes*) is a familiar example. This creature, although viewed with horror by careful housekeepers, preys upon house flies and small cockroaches, and is by no means an entirely undesirable denizen of households. It is prevalent in the Southern States, and extends as far north as the Hudson River Valley. The order *Symphyla* contains the single family *Scolopendrellidæ*, which have a great resemblance to certain of the *Thysanura* among the insects. The order *Pauropoda* consists of the single family *Pauropodidæ*, which contains only three genera. The type genus, *Pauropus*, a curious crustacean-like form, was first discovered by Lord Avebury (Sir John Lubbock) in his kitchen garden in 1866.

Consult S. H. Scudder, "Systematic Review of our Present Knowledge of Fossil Insects, Including Myriapods and Arachnids," in *United States Geological Survey, Bulletin No. 31* (Washington, 1886), C. H. Bollman, "Myriapoda of North America," in *United States National Museum, Bulletin No. 46* (ib., 1893), F. G. Sinclair, in *Cambridge Natural History*, vol. v (London, 1895). See CENTIPEDE.

MYRICA, mī-rī'kā. A genus of Asiatic and North American shrubs. See CANDLEBERRY.

MYRINA. The name of an ancient city on the island of Lemnos (q. v.).

MYRISTIC ACID (from Neo-Lat. *Myristica*, from Gk. *μυριστικός*, *myristikos*, suitable for anointing, from *μυρίειν*, *myrizen*, to anoint, from *μύρον*, *myron*, unguent). A saturated crystalline fatty acid, $C_{15}H_{27}COOH$, found in nutmeg, the seed of *Myristica fragrans*, growing on the Molucca Islands and cultivated in tropical countries. It occurs in the form of a glyceride in the fat of the nutmeg, or nutmeg butter. It has also been found in small quantity among the products of the saponification of spermaceti and of the fatty matter of milk, and hence this organic acid is one of those which are common to both the animal and vegetable kingdoms.

MYR'MECO'CHORY (from Gk. *μύμηξ*, *myrmēx*, ant + *χωρέω*, *chōreō*, I wander). A type of plant distribution in which the seeds or fruit are conveyed by ants. It was formerly supposed that the ants mistook the seeds for their own pupa and hence conveyed them to their nests. Further investigation has shown that certain oil bodies or elaiosomes attract the ants and are used by them for food. More than 150 species of European plants are known to have seeds possessing these bodies, and hence transported by ants. The record distance of transportation seems to be 20 to 70 meters, and a single colony of ants will convey many thousand seeds during the season.

MYR'MECOPHYLY. See MYRMECOPHYTES.

MYRMECOPHYTES, mēr'mē-kō-fits (from Gk. *μύμηξ*, *myrmēx*, ant + *φυτόν*, *phyton*, plant), or MYRMECOPHILOUS PLANTS. Plants in which there are symbiotic relations between the plants and ants. Typical myrmecophytes are most commonly found in the tropics, and present peculiarities that are hard to explain in a purely scientific way. In some cases ants cut off leaves, take them to their nests, and raise crops of fungi that serve them as food. In other cases, as in the famous South American *Cecropia*, ants live in peculiar chambers within the plant, and feed upon products that appear to be useless so far as any other purpose is concerned. They appear, on the other hand, to defend the plants in which they dwell against leaf-cutting ants and other enemies. The relation here outlined is one of the most remarkable known types of symbiosis. The terms "myrmecophily" and "myrmecophilous" should be discarded for "myrmecophytism" and "myrmecophytic." See *CECROPIA*, *MYRMECOCHORY*, *SYMBIOSIS*.

MYRMID'ONES (Lat., from Gk. *Μυρμιδόνες*). In the *Iliad*, the Achæans of Phthiotis, in the south of Thessaly, ruled by King Peleus and led to the Trojan War by his son Achilles. Later writers discovered an eponymous hero, Myrmidon, son of Zeus and Eurymedusa and father of Actor, the husband of Ægina, daughter of Asopus, who was by Zeus the mother of Æacus. For Æacus Zeus changed the ants (*μύμηκες*, *myrmēkes*) on the island of Ægina to men, when its people had died of a plague, and this race later wandered to Thessaly. The story is evidently due to the resemblance which the Greeks saw between the words "Myrmidones" and "myrmēkes." Modern scholars have thought that the Myrmidones went from Thessaly to Ægina.

MYROB'ALAN (Lat. *myrobalanum*, from Gk. *μυροβάλανος*, *myrobalanos*, from *μύρον*, *myron*, unguent + *βάλανος*, *balanos*, acorn). The astringent fruit of certain species of *Terminalia* (family Combretaceæ), natives of the mountains of India. *Terminalia bellerica* and *Terminalia chebula* produce most of the myrobalans of commerce, but the fruits of other species often appear. Formerly myrobalans were credited with tonic properties; now they are rarely used medicinally. They are largely exported for tanners' and dyers' use, since they give a durable yellow with alum and an excellent black with iron. A number of species are valuable for timber, the best known of which, *Terminalia catappa*, is a large deciduous tree planted in many tropical countries. It is a popular shade tree in Honolulu, where it is called Mexican almond from the almond-like flavor of the nuts.

MY'RON (Lat., from Gk. *Μύρων*). An Athenian sculptor, who flourished about the middle

of the fifth century B.C. He was a native of Eleuthera, near the Boeotian frontier of Attica, and is called a pupil of Hagelaidas of Argos. In his style he belongs in the period of transition just before Phidias, but his works show also a remarkable power of observation and great technical skill. He was a worker primarily in bronze, and also skilled in the engraving of plate. No original work of his has survived, but late copies of some of his statues are extant. Of these the most famous is the Discobolus (q.v.), or discus thrower, of which there are specimens in the Vatican and the British Museum, though the best copy is in the Palazzo Lancellotti in Rome (See illustration under GREEK ART). Another work was a group on the Acropolis of Athens showing Marsyas preparing to pick up the flutes thrown away by Athena, but starting back at the approach of the goddess. A copy of the Marsyas is in the Lateran Museum in Rome. In antiquity a bronze cow on the Acropolis, made by Myron, was especially famed for its truth to nature. Many epigrams on his statue of the runner Ladas (q.v.) have also come down to us. Consult: Adolf Furtwängler, *Masterpieces of Greek Sculpture*, English translation by E. Sellers (New York, 1895); E. A. Gardner, *Six Greek Sculptors* (London, 1910), id., *A Handbook of Greek Sculpture* (ib., 1911), R. B. Richardson, *A History of Greek Sculpture* (New York, 1911), H. H. Powers, *The Message of Greek Art* (ib., 1913).

MYROSIN, mīr'ō-sin. See DIGESTION IN PLANTS; ENZYME.

MYRRH, mīr. An umbelliferous plant. See CICELY.

MYRRH (AS. *myrre*, *myrra*, from Lat. *myrrha*, *murrha*, *murra*, from Gk. *μύρρα*, *myrrha*, *myrrh*, from Aram. *mūrā*, Heb. *mōr*, Ar. *murr*, *myrrh*, from Aram. *mārr*, Heb. *mārar*, Ar. *marra*, to be bitter). A gum resin produced by *Balsamodendron myrrha*, a tree of the natural order Amyridaceæ, growing in Arabia and in eastern Africa. The myrrh tree is small and scrubby, spiny, with whitish-gray bark, thinly scattered small leaves consisting of three obovate obtusely toothleted leaflets, and the fruit a smooth brown ovate drupe, somewhat larger than a pea. Myrrh exudes from the bark in oily yellowish drops, which gradually thicken and finally become hard, the color at the same time becoming darker. Myrrh appears in commerce either in tears and grains or in pieces of irregular form and various sizes, yellow, red, or reddish brown. It is brittle and has a waxy fracture, often exhibiting whitish veins. Its smell is balsamic, its taste aromatic and bitter. Myrrh and frankincense were commonly used by the ancients for fumigation. Myrrh is used in medicine as a tonic and stimulant, in disorders of the digestive organs, excessive secretions from the mucous membranes, etc., also to cleanse foul ulcers and promote their healing, and as a mouth wash and gargle, particularly in a spongy or ulcerated condition of the gums. The best myrrh is known as Turkey myrrh, being brought from Turkish ports. Most of the myrrh of commerce, however, passes either through Aden or through Bombay. The chief constituents of myrrh are a resin known as myrrhin, a gum, a volatile oil known as myrrhol and having the composition $C_{10}H_{16}O$, and a bitter principle. See GUMS.

MYRTA'CÆÆ (Neo-Lat. nom. pl., from Lat.

myrtus, Gk. *μύρτος*, *myrtos*, myrtle, from Pers. *mārd*, myrtle), or MYRTLE FAMILY. A family of dicotyledonous trees and shrubs. It is one of the large families of the order Myrtales, which with Umbellales culminates the dicotyledonous series called Archichlamydeæ. The whole order is characterized by perigynous or epigynous flowers and a strong tendency to develop four-parted flowers. The Myrtaceæ include about 80 genera and 2800 species, well distributed through the tropics, but especially developed in South America and Australasia. Some of the species are gigantic trees, as the *Eucalyptus* or gum trees of Australia and certain species of *Metrosideros*. The timber is generally compact. Astringency seems to be characteristic of the family, and the leaves or other parts of some species are used in medicine for this property. A fragrant or pungent volatile oil is often present in considerable quantity, of which oil of cajuput and oil of cloves are examples. Cloves and pimento are among the best-known products of this family. The berries of several species are occasionally used as spices. A considerable number yield edible fruits, among which are the guava, species of the genus *Eugenia*, and some species of *Myrtus*. A remarkable pairing of genera occurs between South America and Australia, each continent having its own genera, many of them comprising hundreds of species. For example, *Eucalyptus* (200 species) and *Melaleuca* (100 species) belong to the Australasian region, while *Myrcia* (500 species) belongs to the American tropics. The largest genera with a general distribution are *Eugenia* (760 species) and *Myrtus* (100 species).

MYRTILUS, mēr'ti-lūs. See HIPPODAMIA; CENOMAUS; PELOPS.

MYRTLE (*Myrtus*). A genus of plants of the family Myrtaceæ.

COMMON MYRTLE (*Myrtus communis*).

The common myrtle (*Myrtus communis*) is well known as a beautiful evergreen shrub, or a tree of moderate size, with white flowers. It is a native of the Mediterranean region and of the temperate parts of Asia. The leaves are astringent and aromatic, contain a volatile oil, and were used as a stimulant by the ancients. The berries are also aromatic, and are used in medicine in Greece and in India. A myrtle wine, called myrtidanum, is made in Tuscany. Myrtle bark is used for tanning in many parts of the south of Europe. Among the ancient Greeks the myrtle was sacred to Venus as the symbol of youth and beauty, and was much used in the festivals. It is often mentioned in poetry. The small-leaved myrtle (*Myrtus microphylla*) of Peru has red berries of the size of a pea, of a pleasant flavor and sugary sweetness. Those of the luma (*Myrtus luma*) are also palatable, and are eaten in Chile, as are those of *Myrtus ugni*, the Chilean guava, which is said to become a large tree with very hard and useful

wood. These species have all been successfully grown in California as outdoor ornamental shrubs.

MYRTLE BIRD. The American yellow-rumped warbler (*Dendroica coronata*). It is about 5¾ inches long, bluish ash above, streaked with black, white below, with a black patch on the breast, crown, rump, and sides bright yellow, and the throat white. It is one of the most numerous and earliest of spring migrants in the United States, and scatters all over the country, but passes on to the north, and few breed south of the latitude of Lake Ontario. The name refers to the prevalence of this warbler in the Southern States in winter, where they feed on berries, especially those of the wax myrtle (*Myrica cerifera*). From the Rocky Mountains to the Pacific coast a very similar species (differing mainly in having the throat yellow) takes the place of the Eastern form, it is known as Audubon's warbler (*Dendroica auduboni*).

MYRTLE FAMILY. A popular name for the family Myrtaceæ (q v).

MYSIA, mīsh'ī-ā (Lat., from Gk. *Μυσία*). In ancient geography, a district in the north-western part of Asia Minor, bounded on the north by the Hellespont and the Propontis, on the east by Bithynia and Phrygia, on the south by Lydia, and on the west by the Ægean (Map: Greece, Ancient, E, F 2). Strictly, Mysia was the southeast part of this district. The principal rivers were the Granicus, Scamander, Caicus, Æsepus, and Rhyndacus. The surface is mountainous in the interior, partly table-land; among the mountains are Ida in the west and Olympus in the north and east. The inhabitants were thought by some ancient writers to be of Thracian, and by others of Lydian, descent, probably there were immigrations from both countries. Mysia was subject to the Lydian monarchy, and under the Persian dominion formed, together with Lydia, one of the satrapies created by Darius. After the death of Alexander the Great it shared in the vicissitudes of Asia Minor during the wars of his successors and the Gallic invasion, but first assumed prominence in history with the rise in the third century B.C. of the Kingdom of Pergamum (q v). After 130 B.C. Mysia became part of the Roman province of Asia.

MYSLOWITZ, mī'slō-vīts. A frontier town in the Province of Silesia, Prussia, on the Przemska, 110 miles southeast of Breslau (Map: Prussia, H 3). It is at the point where the boundaries of Poland, Galician Austria, and Prussia meet. Coal mining, zinc refining, flax spinning, and brickmaking are its principal industries. Pop., 1900, 13,365; 1910, 17,838.

MYSOPHOBIA, mī'sō-fō'bi-ā. See INSANITY. *Borderland and Episodic States*.

MYSORE, mī-sōr', or **MAISUR**, mī-sōōr'. One of the most important of the native states of India. It lies between lat 11° 36' and 15° 2' N. and long 74° 38' and 78° 36' E. (Map: India, C 7). Mysore is surrounded by British territory, almost all of which is the Madras Presidency, a portion of the southwest frontier is contiguous with Coorg and of the northwest with the Bombay Presidency. Its area is 29,475 square miles, being thus nearly as large as South Carolina and a little larger than the combined area of Vermont, New Hampshire, Massachusetts, and Rhode Island. The state lies between the Eastern and Western Ghat ranges in the form of a triangle, with the apex at the south in the group of the Nilgiris. It

is an undulating table-land, much broken by chains of rocky hills. The general elevation is about 2000 feet in the north and the south and about 3000 feet at the central water-parting which separates the Kistna and Cauvery basins. Most of the streams, none of which is navigable in Mysore, ultimately reach the Bay of Bengal. The state is naturally divided into two distinct regions—the hill country (Malnad) in the west and the larger, more open country (Maidan) in the east. The Malnad is a picturesque region of mountain and forest, the Maidan is better adapted to agriculture and more populous. Notable are the numerous isolated peaks, called *droogs*, which reach 4000 or 5000 feet. The highest point in Mysore is Mulainagiri (6317 feet), in the west, somewhat north of lat. 13°, in the Baba Bubans. There are three seasons—the rainy, from early June, with some interval in August and September, to mid-November, the cold, which is usually rainless, from mid-November to the end of February, and the hot, which is marked by occasional welcome thunderstorms, from March to the end of May. At Bangalore the temperature range in the rainy season is 64° to 84°, in the cold season, 51° to 80°, in the hot season, 66° to 91° or sometimes 96°. The annual rainfall varies from as little as 19 inches in the north central part of the state to as much as 360 inches on the crest of the Western Ghats.

An extensive system of irrigation is maintained by damming the streams so as to form reservoirs (tanks), from which the water is conducted in artificial channels. These tanks, varying from the size of a small pond to that of a large lake, number nearly 30,000. In general, however, the success of agriculture depends upon rainfall rather than impounded waters. Over 35 per cent of the total area is under cultivation, and less than one-sixth of the cultivated area is irrigated. By far the largest crop is raggee, this crop and rice and other food grains and pulses constitute the great bulk of agricultural produce. Other crops of importance are oil seeds, coffee, cotton, and sugar cane. About 66 per cent of the population is dependent upon agriculture.

The only mining of importance is that of gold. Upwards of 95 per cent of India's gold output is yielded by Mysore. In 1903 the output of the state was 598,769 ounces, valued at £2,283,999; in 1912, 561,065 ounces, £2,158,362. Gold is found chiefly in the Kolar district, in the extreme eastern part of the state. The manufactures include cottons, silks, carpets, ornaments of gold and silver, articles of copper and brass, pottery, articles in carved sandalwood, vegetable oil, leather, etc. A system of railways radiates from Bangalore; the length of railway open to traffic in Mysore is about 500 miles.

The population of Mysore, according to the census of March 10, 1911, was 5,806,193 (2,934,621 males, 2,871,572 females), showing an increase of 4.8 per cent over 1901. In 1871 the population was 5,055,102; in 1881, 4,186,188, the decrease being due largely to the great famine of 1876-78; in 1891, 4,943,604 (18.1 per cent increase); in 1901, 5,539,399 (increase 12.1 per cent). About three-fourths of the people speak Kanarose, about 15 per cent speak Telugu, chiefly in the Kolar district; about 4 per cent speak Tamil, which predominates at the Kolar gold fields; about 5 per cent speak

Hindustani. In 1911 the unmarried numbered 1,597,180 males and 1,106,337 females; married, 1,197,404 and 1,205,726. widowed, 140,037 and 559,509. In respect of religion, the Hindus, of whom there are 72 castes, are vastly preponderant, the Lingayats constitute the strongest Hindu sect. In 1911 Hindus numbered 5,340,973. Mohammedans, 314,494, Christians, 59,844. Jains, 17,630, animists, 72,196. In 1901 Christians numbered 50,059. Of the Christians in 1911, 4902 males and 2561 females were of European race, 2673 and 3154 Eurasian, and 24,278 and 22,276 native, Roman Catholics numbered 42,543, Anglicans, 6656; Methodists, 3825, Baptists, 1269, and Presbyterians 1141. Of the total population, persons literate numbered 364,998 (328,816 males, 36,182 females), of whom persons literate in English were 40,641 (34,469 males, 6172 females). Since 1908 primary education has been gratuitous. In 1912 there were 2567 public schools and colleges and 1911 private schools, with a total enrollment of about 124,000 males and 25,000 females. A little over one-eighth of the population is urban. The largest cities are Bangalore and Mysore. Bangalore, including the adjoining British civil and military station, had, in 1901, 159,046 inhabitants, a decline, due chiefly to plague, of 11.8 per cent from 1891, in 1911, 189,485, an increase of 19.1 per cent. Bangalore City had in 1911 88,651 inhabitants (increase 27.7 per cent), and the civil and military station 100,834 (increase 12.5 per cent). The population of Mysore City was 68,111 in 1901 and 71,306 in 1911. Other large towns are Kolar, Tumkur, Channapatna, Davangere, and Tarikere.

The ruler of Mysore is the maharajah, in whose name and subject to whose sanction the administration is carried on by the divan, or Prime Minister, assisted by two councillors. The dynastic capital is Mysore City, but the higher offices of state are at Bangalore. The maharajah resides for a part of the year at each of these places. In 1907 a legislative council was formed, consisting of from 13 to 18 members. A representative assembly, elected by leading merchants, ryots, and local bodies, meets annually at Mysore for discussion and suggestion, it has no legislative powers. There is a chief court of justice consisting of three judges. The state comprises eight administrative districts (Bangalore, Kolar, Tumkur, Mysore, Hassan, Kadur, Shimoga, and Chitaldroog), each in charge of a deputy commissioner. The government of India is represented by a Resident. Revenue is derived chiefly from land tax, excise, forests, and mining leases.

History. Frequently mentioned in Hindu literature under the rule of various dynasties, the territory was merged with the Ballala Kingdom of Delhi after the Mohammedan invasion of the fourteenth century. After the overthrow of the Ballala rule by Ala ud Din, a new state arose, including Mysore and part of the Carnatic, with Vijayanagar as capital. In 1565 its ruler, Rajah Ram, was defeated and killed at the battle of Talikota by a Moslem confederation, and the state again became divided under the rule of several minor chiefs. One of these, Rajah Wodeyar, captured Seringapatam in 1610, and his successors strengthened their rule until, at the close of the seventeenth century, their sovereignty extended throughout Mysore. This dynasty was supplanted in the eighteenth century by Hyder Ali (q.v.), the formidable foe

to the rising British power in India. By the defeat and death of his son Tipu, Sultan at Seringapatam, in 1799, the state came under British control. Part of the territory was annexed to India, and a descendant of Wodeyar was appointed to rule over the remainder. Owing to misrule, the British took charge of the administration from 1831 to 1881.

Consult: Census Commission of India, *Census of India*, 1891, vol. xxv; 1903, vol. xxiv (Bangalore, 1893-1904); R. H. Elliot, *Gold, Sport, and Coffee Planting in Mysore* (London, 1894), Sir Roper Lethbridge, in *Imperial and Asiatic Quarterly Review, Third Series*, vols. xvii, xxiii (ib., 1904-07).

MYSORE, or MAISUR (buffalo town). The dynastic capital of Mysore state, India, and headquarters of Mysore district, in the southern part of the state and on the Mysore State Railway in lat 12° 18' N. and long 76° 40' E (Map-India, C 7). It is situated in a valley at the northwest base of the temple-crowned Chamundi Hill, which rises 3489 feet above the sea. Formerly the old parts of the city were crowded and unsanitary, but conditions have been greatly ameliorated under the special improvement board formed in 1903. In recent years large extensions have been made to the north and west, increasing the area of the city from about 3 square miles to about 7½ square miles. In the new quarter have been erected many fine public buildings. In the wooded grounds of Gordon Park, on the high ground to the west, are the public offices, surmounted by a dome. In the vicinity are the Maharajah's College, the law courts, and the Victoria Jubilee Institute. The nucleus of the city is the fort, which is quadrangular, three of its sides being about 450 yards long and the remaining or south side somewhat longer. The chief of the numerous buildings within the fort is the maharajah's palace. As the old palace was partially destroyed by fire in 1897, it was decided to build a new palace of more modern design on the same site. The new palace is a decorative structure, embellished with porphyries and other ornamental stones and exhibiting interesting stone carvings done after the manner of the ancient sculptured temples of the region. The leading industry of Mysore is the manufacture of carpets. In 1891 the population was 74,048; in 1901, 68,111 (the decrease, due largely to plague, being 8 per cent); in 1911, 71,306 (increase 4.7 per cent).

Mysore is a place of great antiquity, having given its name to the surrounding country in the third century B.C., but few of the buildings existing to-day are more than one hundred years old. The original fort is said to have been constructed in 1524. Mysore was the ancestral capital of the state, but was superseded in 1610 by Seringapatam (10 miles to the northeast), which remained the seat of the court till the downfall of Tipu Sultan in 1799. Tipu had demolished the fort and palace, which were rebuilt upon the restoration of the Hindu rajah, and the court was removed to Mysore. The principal offices of state are at Bangalore, where the maharajah resides during part of the year.

MYSTACOCETI, mis'tá-ké-sé'ti. See CETA-CEA.

MYSTAGOGUE, mis'tá-góg (Lat. *mystagogus*, from Gk. *μυσταγωγός*, one who introduces into mysteries, from *μύστος*, *mystēs*, initiate,

from *μειν*, *myein*, to initiate, itself derived from *μύειν*, to close the eyes (or lips) + *ἀγωγός*, *agōgos*, leader, from *ἄγειν*, *agein*, to lead). In the Greek religious system, the functionary who directed the preparations of the candidates for initiation in the mysteries (qv). He had himself passed through all the grades of initiation, and was probably under the cognizance of the state. Prior to presenting himself for initiation, each votary had to place himself under the guidance of one of these mystagogues, and received instruction from him as to the various purifications and ceremonies to be performed. The mystagogue passed upon the fitness or unfitness of the applicant to receive the rites. In the Christian writers the term is used of the priest who prepared candidates for the sacraments of baptism, confirmation, and the Eucharist.

MYSTERIES (Lat. *mysterium*, from Gk. *μυστήριον*, *mystērion*, from *μύστος*, *mystēs*, initiate; cf. MYSTAGOGUE). Secret rites connected with the Greek religion. They have been divided into two groups: (1) those in which the participants were a small circle of priests, officially connected with the sanctuary, and (2) those in which the participants were numerous. For a long time the view was prevalent that the mysteries concealed deep truths and the remnants of a primitive revelation too profound for the popular mind. The chief representative of this doctrine was G. F. Creuzer in his *Symbolik und Mythologie der alten Völker* (4 vols., Leipzig and Darmstadt, 1836-43). The deathblow to these theories, so far as critical scholarship was concerned, came from Lobeck, who in his *Aglaophamus* (Königsberg, 1829) showed that such occult wisdom was no part of their teaching. The most celebrated and revered were the Eleusinian mysteries, connected with the worship of Demeter (see CERES) and Cora (or Persephone) at Eleusis (qv) in Attica (See ELEUSINIAN MYSTERIES.) With these goddesses there appear in the Eleusinian cult an anonymous god and goddess (*θεός*, *theos*, and *θεά*, *thea*), Pluto, Iacchus, Triptolemus, and Eubuleus, whose connection with the worship is by no means clear. The rites and legends connected with this cult are very similar to those prevailing not long ago among the European peasants, and point clearly to a similar belief in a grain spirit, which dies and is reborn yearly. So far as can be judged, the Eleusinian mysteries consisted largely in the rehearsal before the initiated (*μύσται*, *mystai*) of a sort of miracle play, or ritual drama, in which the rape of Cora, the sufferings of Demeter, and the final reunion of mother and daughter, together with the bestowal of the art of agriculture on man by Demeter, were represented in dramatic form. The initiation seems to have symbolized the redemption of the soul from the powers of the lower world and its reception by the goddess as pure. So far as can be learned from literature and art, the candidate was purified by a sacrifice which he himself brought, and, after fasting and preparation, wandered through a series of dark and confused passages, beset by terrifying sights and sounds, but emerging at last into the light, where he saw the goddesses. We know that candidates had to be initiated first into the Lesser Mysteries at Agræ, near Athens, six months before the ceremonies at Eleusis. The term "Mystæ" seems to include all the initiates, while those who

had been fully received are sometimes called *ἐρόπται*, *epoptai* (those who see). As to the public ceremonial we are better informed. The Lesser Mysteries were celebrated in the month Anthesterion (approximately February). They were accompanied, like the Greater Mysteries, by a sacred truce. The Greater Mysteries were celebrated in Boëdromion (approximately September) at Eleusis, though there was much preliminary ritual at Athens. On the 14th certain sacred relics (*τὰ ἱερά, ta hiera*) were brought from Eleusis to Athens and deposited in the Eleusina; the next day seems to have been given to the gathering of the celebrants, on the 16th the *Mystæ* went in procession to the beach at Phalerum for solemn purification in the salt water; the 17th and 18th were filled with offerings and ceremonies at various sanctuaries in Athens, on the 19th, early in the day, the sacred procession escorted the image of Iacchus and the sacred relics to Eleusis. At the bridge over the Cephissus jests and gibes were exchanged, and it was evening (hence the 20th in Greek reckoning) when they arrived at the great sanctuary. The following nights and days were given up to the performance of the sacred ritual and the ceremonies of initiation, which certainly made a strong impression on the spectators. On the 23d the ceremonies closed with a solemn pouring out of water from two earthen jars towards the east and west. It is certain that no dogmatic teaching formed part of the Eleusinian worship, it is equally certain that those who were fully initiated into the mysteries had a stronger hope than others of a real life beyond the grave, and that in this further life they would enjoy the favor of Ceres. The chief officials connected with this sanctuary were the Hierophant (q.v.), who was always from the Eleusinian family of the Eumolpidae, and from the family of the Kerykes the Dadouchos or torchbearer, the Hierokeiŕx or herald, and the priest at the altar. In connection with the celebration a sacred truce, extending from the full moon of the previous month to the tenth day of the following, was proclaimed so that the *Mystæ* could travel in security. Initiation was open to all ages and conditions, including even slaves, provided they were Hellenes (or later Romans) and were free from any great crime. Eleusinian mysteries were celebrated on a smaller scale at Phlius, Megalopolis, and elsewhere, while at Andania in Messenia they appear in combination with the Samothracian worship of the Cabeiri (q.v.).

Bibliography. C. A. Lobeck, *Aglaophamus* (2 vols., Königsberg, 1829), especially valuable for its collection of Greek and Roman passages bearing on the mysteries, Strube, *Bilderkreis von Eleusis* (Leipzig, 1870-72); Nebe, *De Mysteriorum Eleusimorum Tempore et Administratione Publica* (Halle, 1886), Andrew Lang, *Myth, Ritual, and Religion* (London, 1887); E. A. Gardner, *New Chapters in Greek History* (ib., 1892), Theodor Mommsen, *Feste der Stadt Athen* (Leipzig, 1898), Foucart, *Recherches sur l'origine et la nature des mystères d'Eleusis* (Paris, 1895); id., *Les grands mystères d'Eleusis* (ib., 1900), very valuable, though the author's theory of the Egyptian origin of the mysteries is not generally accepted; L. R. Farnell, *Cults of the Greek States*, vol. iii (Oxford, 1906), T. G. Tucker, edition of the *Frogs* of Aristophanes (London, 1906); Arthur Fairbanks, *A Handbook of Greek Religion* (New York, 1910), J. E. Har-

rison, *Prolegomena to the Study of Greek Religion* (3d ed., Cambridge, 1908); and the works cited under ELEUSIS.

Next to the Eleusinian the most prominent were the Samothracian mysteries of the Cabeiri (q.v.). Originally these seem to have been two in number, though later we find two goddesses added, and the four, Axieros, Axiokersa, Axiokersos, and Kasmilos, were identified by the grammarians with Demeter, Persephone, Hades, and Hērines. The rites were believed to afford protection against the perils of the sea, and were doubtless in early times largely confined to seamen. Consult Conze, *Archäologische Untersuchungen auf Samothrake* (Vienna, 1875-80), and Preller-Robert, *Griechische Mythologie*, i 2 (Berlin, 1894).

Another sanctuary of the Cabeiri lay near Thebes, where we find the deities worshiped as Cabiros and Pais (boy). The objects found seem to indicate that these mysteries were origiastic in character. Consult *Athenische Mittheilungen des deutschen archäologischen Instituts*, vol. xiii and xv (Athens, 1888-90).

In the course of time other mysteries, such as those of Isis, Sabazios, Mithras, and other Oriental deities, spread through the Greek world, and at all times there were private sects, like the followers of Orpheus (q.v.), who professed to possess secret teachings which could insure peace and happiness in the other world to those who followed their directions here.

On the general subject of the mysteries, consult, in addition to the books named above Petersen, *Der geheime Gottesdienst bei den Griechen* (Hamburg, 1848), Aurich, *Das antike Mysterienwesen in seinem Einfluss auf das Christentum* (Göttingen, 1894); Rohde, *Psyche* (3d ed., Leipzig, 1902); O. Gruppe, *Griechische Mythologie und Religionsgeschichte* (2 vols., Munich, 1906), W. H. Roscher, *Lexikon der griechischen und römischen Mythologie*, vol. ii (Leipzig, 1890-97).

MYSTERIES OF UDOLPHO. A novel by Mrs. Ann Radcliffe (1794). This once popular romance tells of the castle of Udolpho in the Apennines where terrific scenes of horror occur.

MYSTERY. The name given to a very early type of the mediæval drama, founded upon some part of the Bible narrative concerned with a mysterious subject, such as the incarnation or the resurrection, and in England often used indiscriminately with that of miracle play (q.v.). The traditions of the ancient drama survived to some extent the fall of the Western Empire, and on them were modeled religious plays, intended less for acting than for reading. There is extant a Greek play entitled *Χριστὸς Παῖς* (*The Passion of Christ*), long attributed to St. Gregory Nazianzen, but now thought to be of much later date, which follows the structure of the ancient Greek drama. In the second half of the tenth century Hroswitha or Roswitha (q.v.), a Benedictine nun of Gandersheim in Saxony, wishing to provide her sisters with a substitute for Terence, who was widely read by the learned throughout the Middle Ages, cast six martyrdoms in the form of the old Latin comedy. Through imitations of this kind the classic drama may be said to have continued to exert some influence as late as 1200. But the main impetus to a revival of popular dramatic literature came from the Church. The clergy wished to provide some means of making the great events on which their teaching was

based more vivid and real to their unlettered flocks. This was the more natural because the service of the Church was in its very nature dramatic. Its chief act of worship was, in no abstruse sense, a representation of the sacrifice of Christ, and both the symbolism of the ritual and the responsive nature of the liturgy shared the same character. Especially at the great festivals of Christmas and Easter it was customary to make it still more dramatic by representing the events then commemorated as actually taking place before the congregation. Traces of this procedure are found as early as the closing years of the tenth century. The words used, the directions to the performers, hymns and anthems, were at first in Latin, but as dialogue was introduced they were naturally turned into the vernacular. In the thirteenth century, in fact, mysteries and miracle plays lost the favor of the Church. Having never been a part of the ritual they were gradually, for many reasons, banished from sacred buildings, and the clergy were forbidden to take part in them. They passed first to the churchyard and then to the streets and public squares, where they were performed on movable stages drawn from place to place. Performances of them were given also at court and in the houses of nobles. The actors in England were frequently members of the trade guilds, who arranged for these performances at Christmas, Easter, and Corpus Christi, supplemented by strolling players. In France they came under the control of the *Confrères de la Passion*, which were established in many of the leading towns—societies half religious, half literary, and wholly secularized by the fourteenth century. The plays devoted to the exposition of special mysteries were combined, in England at least, in an immense cycle, covering the entire range of the scriptural narrative from the Creation to the Day of Judgment. In texts belonging to the fourteenth, fifteenth, and sixteenth centuries four of these cycles, more or less complete, have come down to us. They are the York cycle (48 plays), the Towneley (32 plays), the Chester (25 plays), and the Coventry (42 plays), of other cycles there are fragments. The mystery plays died slowly as the regular drama came into existence. As late as 1580, we hear of one being represented at Coventry. The English actor-manager, Ben Greet, produced one of the fourteenth-century plays, *Everyman*—rather a morality than a mystery play, however—in England in 1903, and the following year in the United States.

Bibliography. For both mysteries and miracle plays Wright, *Early Mysteries* (London, 1838), A. D'Ancona, *Sacre rappresentazioni dei secoli 14-16* (Florence, 1862), Louis Petit de Julleville, "Les mystères," in *Histoire du théâtre de France* (2 vols., Paris, 1886); F. H. Stoddard, *References for Students of Miracle Plays and Mysteries* (Berkeley, Cal., 1887), a classified list, Charles Davidson, *Studies in the English Mystery Play* (New Haven, 1892), K. L. Bates, *The English Religious Drama* (New York, 1893); J. A. A. J. Jusserand, *Literary History of the English People* (ib., 1895); J. M. Manly, *Specimens of the Pre-Shakespearean Drama* (Boston, 1897), arranged so as to show development; A. W. Ward, *History of English Dramatic Literature* (3 vols., New York, 1899); E. H. Moore, *English Miracle Plays and Moralities* (London, 1907); C. M. Gayley, *Plays of our Forefathers* (New York, 1907); A. W. Pol-

lard (ed.), *English Miracle Plays, Moralities, and Interludes* (5th ed., Oxford, 1909), S. B. Hemingway (ed.), "English Nativity Plays," in *Yale Studies in English*, vol. xxxviii (New York, 1909), W. R. Mackenzie, *English Moralities* (ib., 1914), and for reprints, besides the specimens given in books referred to above, *York Plays*, edited by L. T. Smith (Oxford, 1885); *Chester Plays*, edited by Wright (London, 1843-47), *Towneley Mysteries*, edited by Raine (Newcastle, 1836); *Digby Mysteries*, edited by Furnivall (London, 1882), *Miracles de Notre Dame*, edited by G. Paris and Robert (Paris, 1876-81). See **DRAMA**, **MIRACLE PLAY**, **PASSION PLAY**.

MYSTERY OF EDWIN DROOD. The last and unfinished novel by Charles Dickens. The first number appeared in 1870, and only six were finished when he died.

MYSTERY OF MARIE ROGET, ma'rè' rô'zha'. A tale by Edgar A. Poe, published in three parts in *Snowden's Lady's Companion* (1842). It is a sequel to *Murders in the Rue Morgue*.

MYSTIC. A city in Apanoose Co., Iowa, 7 miles northwest of Centerville, on the Chicago, Milwaukee, and St. Paul Railroad (Map Iowa, E 4). It is in a rich coal district, and coal mining is the chief industry. Pop., 1900, 1758; 1910, 2663.

MYSTIC HEXAGRAM. See **HEXAGRAM**, **MYSTIC**.

MYSTICISM, mîs'tî-sîz'm (from *mystic*, from Lat. *mysticus*, from Gk *μυστικός*, *mystikos*, relating to mysteries, from *μύστης*, *mystēs*, initiate). A term used in so many senses that it is not easy to define. Two types of definition are found—one which defines mysticism as an experience which assumes to give immediate knowledge of an external Power, without the mediation of history or reason; the other definition would only add to this the emphasis on feeling. It defines mysticism as the sense of union with the Supreme, verified by feeling. The basis of mysticism is in the exaltation of the automatic and passive states and the diminution of the active and individual. Such a state may result in a merely passive reception of any passing impressions or in a wild riot of uncontrolled emotions. In any case the person is carried "out of himself" and is easily led to put a supernatural interpretation upon his experiences. He often regards his feelings as the source of knowledge not otherwise obtainable and is tempted to look upon himself as being favored with a special revelation from divine powers. Mystic feeling, however, need not be religiously interpreted. Music, drugs, the contemplation of nature, and many other experiences may induce the feeling. Even in savage life, however, these feelings begin to be connected with religion. The shaman of Central Asia, the American Indian medicine man, and the emotional religious dances of most savage tribes are examples. In most of the higher religions, persons of the mystic temperament have used the religion to explain their experiences. Religious mysticism exhibits two wholly different qualities, curiously combined, viz., pure individualism and the sinking of personality. The mystic may have fervently striven to attain the exalted state of communion with God, yet, when once it has been reached, conscious activity ceases, and through a sort of passive rapture the subject seems merged in the object

of his yearning. Direct intuition supersedes reason. Mysticism tends to be independent of external authorities, whether of rite, creed, priesthood, or Scripture.

In races which have developed a philosophy, mystic experiences have naturally been subjected to a philosophical explanation. Since the feeling is interpreted as one of union with the Supreme, the philosophy identifies the soul of man with the supreme soul of the universe, whether it calls the Supreme God or gives it some other name. This philosophy tends also to identify all other things, so far as they have reality, with the Supreme, i.e., it tends to become pantheistic. It is often accompanied by a belief that the existence of the visible universe is merely apparent, not real. The most thorough and consistent philosophical mysticism is that of Hindu philosophy, especially the Vedantic school (See VEDANTA). This holds that the only reality in the universe is a Supreme, Brahm, of which man is one manifestation, and the sense of personal individuality is illusion. Probably the most complete discipline of mystic practice, to induce the feeling of union with the Supreme and the loss of individuality, is the Hindu yoga. The philosophy, and to some extent the yoga practice, was borrowed by northern Buddhism and carried into Tibet and Japan. In China, Confucianism was antimystical, but Taoism contained mystic elements. Greece had mysticism in the religious mysteries which became popular in her later days, and Neoplatonism was grounded, both as a philosophy and as a religion, in mysticism. The Moslem Sufis of Persia were pantheistic mystics, the roots of their system probably going back to Hindu philosophy. Sufism is noteworthy as giving the best literary expression to mysticism in the symbolic poetry of Hafiz, Rumi (qq.v.), and others. Slight traces of mysticism appear in the New Testament, especially in John, but Christian mysticism as a system is derived from Neoplatonism through the writings of pseudo-Dionysius Areopagita (see DIONYSIUS THE AREOPAGITE) and his great commentator, Maximus Confessor (seventh century). John Scotus Erigena (ninth century) translated the pseudo-Dionysius into Latin, and thus introduced Greek mystical theology in western Europe, where, superimposed upon the mysticism of St. Augustine, it enjoyed increasing popularity. The most flourishing period of Christian mysticism was in the Middle Ages and just previous to the Reformation. Monasticism proved a congenial soil for the cultivation of the mystic spirit, and some of its most perfect types are found among the monks, e.g., in the Eastern Church the Hesychastæ of Mount Athos (see HESYCHASTS) and, in the Western, Bernard of Clairvaux, Francis of Assisi, and Ignatius of Loyola. The monastery of St. Victor, near Paris, was a very influential centre of mysticism in the twelfth century. Several famous mystics appear among the Schoolmen, e.g., Bonaventura, a disciple of the Victorines. Amalric of Bène, a Paris doctor (died 1207), pushed his mysticism to a pantheistic extreme.

Among the Dutch mystics are Ruysbroeck, author of several spiritual tracts (died 1381), Gerhard Groot, founder of the Brethren of the Common Life (q.v.) (died 1384), and Thomas à Kempis, author of the *Imitation of Christ* (died 1471). Eckhardt (died c.1327) stands in the front rank of German mystics, and among

his disciples were Tauler (died 1361) and Suso of Constance (died 1366). The *German Theology*, a popular book of devotion, which strongly influenced Luther, was published by him in 1517 (Eng. trans., 3d ed., New York, 1901). Jakob Bohme (died 1624) belongs to the Protestant school. Certain Protestant sects made mystic elements prominent, as some branches of the Anabaptists and the Friends. Few Protestant churches, however, have been wholly without representations of mysticism. Even in New England, Jonathan Edwards showed a strong mystic strain, and the revivals which began in his time and spread over the land for the next century gained much of their power from the assumption of mystic principles, laying great stress on feeling as a revelation of the will of God, but not leading to the pantheism of philosophic mysticism. Among more recent German mystics are Novalis, the disciple of Romanticism (died 1801). In England we find George Fox (died 1690). Among his contemporaries the Cambridge Platonists (q.v.), especially Cudworth, More, and Smith, were both rationalistic and mystical, George Herbert (died 1633), Francis Quarles (died 1644), Henry Vaughan (died 1695), and later William Law (died 1761) were purely mystical. What is known as Quietism (q.v.) was a movement of the same nature with whose earlier stages St. Francis of Sales, Bishop of Geneva (died 1622), had some sympathy, and which the Spaniard Molinos (died 1696), Fénelon (died 1715), and especially Madame Guyon (died 1717) made more definite. Not a few of the most gifted and honored among mystics have been women, e.g., St. Hildegard (died 1178), Elizabeth of Schönau (died 1164), St. Catharine of Siena (died 1380), and St. Theresa (died 1582).

In whatever religion it appears, mysticism is always essentially the same. Identical mystic experiences are used as a proof of the truth of Hinduism, Mohammedanism, and Christianity alike. The modern studies of the history and the psychology of religion have made it possible to understand the character of mystic experiences and to see that, while real religious experiences, they offer no objective evidence for any system of religion. The estimate of the religious value of mysticism differs greatly, some holding it to be the very essence of religion, and others regarding its influence as of very doubtful worth.

See the notices of the individuals mentioned in this article.

MYSTIC SHRINE, ANCIENT ARABIC ORDER OF NOBLES OF THE. An order asserted to have been founded at Mecca, Arabia, in the year of the Hejira 25. The modern order is of comparatively recent origin. The governing body in America is the Imperial Council, with 101 subordinate branches, called Temples. The order is not a Masonic body, but only Masons of the thirty-second degree of the Ancient and Accepted Scottish Rite, or Knights Templars in good standing, are eligible for admission. The membership in America amounts to about 200,500. See **MASONS**.

MYSZ-GMEINER, mész-g'mí'ner, LULA (1876-). An Hungarian dramatic contralto, born at Kronstadt. At six she took up the study of the violin, at 16 she was receiving vocal instruction from Lassel in her native city, and later she studied at Vienna under Gustav Walter and other famous teachers. After 1896 she visited all the large cities of Austria-Hungary, Germany, Switzerland, Holland, Russia, Belgium, and France; also London, Madrid, and Bucharest. In 1900 she was married to Ernst Mysz, an Austro-Hungarian naval officer.

MYTH (Lat. *mythos*, from Gk. *mýthos*, speech, legend). A form of folklore (q.v.) which sets forth as an historic tale the processes of nature or beliefs concerning cosmogony (q.v.), religion (q.v.), custom (q.v.), tradition, and the like. The sum total of myths is the material for the science of mythology (q.v.), frequently termed comparative mythology. Within this many subdivisions may be set off, as the Greek myths concerning Diana (q.v.), the Teutonic Valhalla myths (see **VALHALLA**), the Polynesian water myths, or the Hindu myths regarding caste (q.v.). Myth is sometimes distinguished carefully from fable (q.v.) and from legend (q.v.). Thus, we may have the fable of Zeus and the frogs, which points a moral teaching, or the legend of St. Christopher (q.v.), which narrates a miraculous event which may or may not have a moral bearing, but the Zeus myth (see **JUPITER**) is based on belief in a sky god and is thus a part of nature worship (q.v.). Ethnologists, however, attach relatively little importance to the distinction, since precisely the same tale that is told by one tribe as a purely literary form of amusement may acquire a sacred, or at least serious, aspect among a neighboring people through association with an important supernatural being or religious ceremony.

MYTHICAL ISLANDS. Fabulous lands, with which popular lore or the imagination of poets and travelers have, since the earliest times, peopled various parts of the ocean. Among the Greeks the Islands of the Blessed (q.v.), lying far in the western ocean, were the homes of those whom the divine favor saved from the pains of death to live in eternal bliss. Later Plato placed in the same part of the world his lost Atlantis (q.v.). Celtic mythology presents a counterpart of the Islands of the Blessed in the fairyland of Avalon (q.v.), where Arthur was carried after his last battle. Of

Celtic origin, too, is the mythical land of St. Brendan (see **BRENDAN**, OR **BRENAINN**), lying off the western coast of Africa, in search of which expeditions set out as late as the beginning of the eighteenth century. To Christian refugees from the Iberian Peninsula, at the time of the Mohammedan invasion, legend ascribed the settlement of the long-sought-for Island of the Seven Cities (q.v.). More within the realm of fact is Marco Polo's Cipango, identified by some with Japan. The Age of Discovery was fruitful of legendary lands, cities, and islands. Best known among these last were the island of Bimini, in the region of the Bahamas, containing the fountain of youth, and the island of Brazil, which owed its name to its precious dyestuffs.

MYTHO. See **MITO**.

MYTHOLOGY (Lat. *mythologia*, from Gk. *μυθολογία*, from *mýthos*, *mythos*, myth + *-λογία*, *-logia*, account, from *λέγειν*, *legcin*, to say). The science of myths, either a body of more or less doubtful stories, as when we speak of Greek or German mythology, or a rational account of how all such stories originate. Every race has its own myths, and in the first sense of the word a mythology has only to enumerate and classify the special stories of each race. The second application of the term, however, comprises various theories put forward to explain myths. Thus, we come to what is now called the science of mythology, which deals with the origins of such myths or popular stories.

Myths may be divided into two sets of categories, arranged either according to the intellectual status of the original myth makers or according to the subject-matter of the myth itself. Thus, we may have myths of savages, as opposed to myths of cultivated races, and we may have myths of cosmogony, as opposed to myths of heroes. In many discussions of mythology it seems to be assumed that the so-called savage myths treated of the same subjects as do the higher myths, only in a less cultivated manner; but this is an error. Hero myths are sometimes called legends, to distinguish them from cosmogonic myths.

Classification of Myths. The first important fact in mythology is that, however much we use the word "mythology" as if it were especially concerned with gods, no sharp line of demarcation can be drawn among primitive races between such myths and the folk tales dealing with human events. The same plot is now associated with a divine person and again with a human hero. Similarly, it will not do to separate philosophical tales purporting to explain the origin of man and natural phenomena from stories that serve merely to amuse, for often in the same tribe the same story is told with and without the explanatory feature, which is now recognized as secondary, especially by American ethnologists. It is customary to divide myths into historical and scientific, i.e., myths of the past of man and myths to explain natural phenomena. But among the most primitive peoples the two sorts of myths become one. A vague tradition of the wanderings of a tribe is simply united with an explanation of a physical process, and thus the scientific myth is also historical. Mythology has to do with religion only because religion is one of the many fields in which the art of telling stories has exercised itself. It does not follow, however, that a story in regard to the flood or to the way the world was made has any religious significance. The

former example is a very good illustration of how the historical myth may become a religious myth. Thus, in India the story of the deluge was told at first without any suggestion that the flood was a punishment of sin, later, however, it is interpreted as a washing out of sin.

Another important principle in the classification of myths is the relativity of imagination in the myth makers. This disposes of the rather crude demarcation into savage and higher myths. Thus, the Polynesian and Melanesian mythology is almost as rich in stories of the gods as is that of Homer, but for all that some of the island blacks are as savage as those of Africa, and their higher mythology merely means that these savages are more imaginative than are the Mishmis and Kacharis of India, who have an active fear of devils and a very vague idea of any other spiritual power except the ancestral ghost. An excellent illustration of mythology in its lowest stages is offered by the Central Australians. Here the whole burden of myths is concerned with the great deeds of the ancestors in the holy *Alcheringa*, or "time of old." Of real gods there is only a Creator whose cosmogonic work is briefly described as "cutting out the world." The Creator made the world and the half-human ancestors of the tribes, but the mythology is concerned only with the latter. Gods, and especially tales of gods, come much later. If we may conclude that ancestor deeds, and a somewhat adventitious and remote scientific explanation of the universe as formed by a superior being or as consisting of such a being's dismembered parts (another popular savage myth), constitute the basis of mythology, we shall no less truly find that the doings of the demons constitute the next stage. This phase of mythology is usually not developed beyond simple concrete performances. There is very little mysticism, and no system. A certain devil has had a difficulty with some member of the tribe and is either driven off or slays the man, who then becomes a devil in turn. A further stage is reached as the devil becomes more godlike, i.e., is no longer a mere mischief-maker, but a helper of man. This stage may be reached by savages, and it is characteristic of Polynesian mythology that, while mainly concerned with the doings of demons, it rises also to the conception of a kind-hearted demon, although this happens seldom.

At the stage when demons and not gods are the controlling spiritual agency, we find animal myths in their crudest form, often, as in totemic tribes, being identical with ancestor-myths, but, again, without such identification. Thus, when the tribe is descended from an animal ancestor, or the ancestor has become an animal, the two sorts of myths merge, but myths about animals may be current without any notion of relationship between man and animal. The same is true in regard to myths about animated trees and mountains, etc. It is quite impossible to draw a sharp line between this stage and that where demons and animals and cult-heroes are elevated to the position of gods, and tales about them become part of theology.

In general we must distinguish between ancestor and cosmogonic myths, the myths of devils and of sprites, and the myths that collect about higher anthropopathic divinities. Again, not exactly cosmogonic, but quasi-historical, are the myths of floods and wanderings and of early settlements reflected in tales of hyperborean

paradises. As the cosmogonic myths are early attempts to give not a religious, but a scientific or at least a logical explanation of the universe, so this class of myths may be called historical, since they are so in form and are so interpreted by the people among whom they are current. The utmost caution must be exercised in attaching any historical value to oral tradition; it seems an established principle that the memory of primitive tribes cannot be safely trusted as to events dating back much more than a century. If there is extraneous evidence that tallies with the myth, the myth is, from the historian's point of view, superfluous; if there is not, it should simply be disregarded for any purpose but that of studying native psychology. In the frequent amalgamation of tribes into a larger political unit myths often lose their original significance and are attached to quite different gods. Even without visible outward change the hero-god becomes modified in spirit, according to the changing theology. Again, as tribes merge and distribute their myths, so myths by their own charm travel from land to land, the characters being changed. Myths in an advanced stage may become purely allegorical, as when a solar culture-hero is represented as destroying barbarism under the guise of a long anthropomorphic tale, such as the epic of the Ramayana in India. Again, in the process of anthropomorphizing, the hero may become so human as to suggest that he was a man, and we thus arrive at the Euhemeristic explanation of all myths as tales told about human beings afterwards elevated to divine rank. Thus, in India the "mortal gods," or gods who had originally been men, are a recognized class, the most conspicuous member of the class being the local Cræsus called Kubera, who is usually regarded as king of the under-world wealth, a Pluto, but in this interpretation he is a god divinized out of a rich man named Kubera.

Explanation of Myths. The example just cited (and analogous cases) led to the notion that all myths were to be interpreted in this way, a view held by some rationalists in India, and favored in Greece by many thinkers, but first reduced to an "atheistic" philosophy of mythology by Euhemerus in the fourth century B.C. In opposition to the older view that myths were to be interpreted allegorically, Euhemerus taught—whether seriously or not is now questioned by some scholars—that the gods were originally men, and that stories about men were transferred to gods, a method here and there countenanced by Plato. Herbert Spencer, who also believes that gods were at first the ghosts of men, has adopted the Euhemeristic explanation in its crudest form. He believes, for example, that there was once a girl called Dawn, and that when she died the Vedic Aryans sang to her ghost the Vedic "hymns to Dawn"—a view consonant neither with the content of the hymns nor with the practices of the poets. At present, if we pass by Spencer's theory with the brief criticism it deserves, there are two accepted schools of interpretation. The older view is that of Max Müller. In its whole form it is quite as unhistorical as Spencer's, but it contains a truth ignored by the opposing school. Müller held that myths were nature poetry, and that many of them in an advanced stage of evolution could be explained by what he called "disease of language," that is, mythology is the result of the misunderstanding, on the part of

a whole people, of their inherited phraseology. Where an old poet referred to sunrise as "the shining one" (feminine) being followed by "the bright one" (masculine), his descendants interpreted the grammatical sex as implying sex in person, and his phrase meant to them "the (male god) Bright (sun) courts Miss Dawn," and so, on the strength of countless errors of this sort, arose mythology, which can be analyzed into its component parts by comparing the names of gods in one language with cognate words in related languages. Müller's error lies in a too sweeping application of this theory, in his lack of appreciation of other causes leading to mythology, and in the weakness of his etymologies. But there is truth in the dictum that a misapprehension makes gods. A Vedic poet sings, "Who is the god whom we should revere?" and his sublime word is interpreted by a later generation as meaning "there is a god called Who, and we should make sacrifice to Who." Then later writers go still further and enjoin upon the priests to make two sets of offerings, one to Who and one to Whom, as distinct deities. The folklore explanation, which has obtained since Mannhardt and Tylor and is steadily gaining ground, rejects both Euhemerism and language disease as factors of mythology, and seeks the explanation of the higher myth in the original conception of the lower. Kronos's brutality and *Little Red Riding Hood* are both stories popular in their day and paralleled by many like stories among savage nations to-day. Such tales are retained, toned down, symbolically explained, but in origin they belong to the tales that please savages. There is no doubt that such is the state of the case, and that *Red Riding Hood* is not a sun myth (exposed to disease of language), but a tale that pleasantly affected peasants. The folklore explanation runs to accumulation of tales, however, without a radical explanation, and it ignores too much what is true in Spencer's mythology, that many tales are simply ghost stories. Nor can it be said that the folklore method is successful in explaining all myths. It is an error to suppose that all myths are psychical reflections of physical or of meteorological phenomena, for much must be attributed, even among savages, to poetical fancy. But what Mannhardt has himself called "nature poetry" and illustrated by modern examples among the Slavs shows that personalities originally solar are sometimes transferred to poetical representatives explicable only in a solar light. The true explanation of mythology will combine the hitherto antagonistic explanations of Lang and Müller, and will also admit that Spencer's theory of ghost mythology is at times applicable. No stereotyped formula can include all the phenomena. In the last analysis will be found folklore, language change, and ghost stories. All three principles are active to-day in India, and probably have always been active among all peoples in proportion to their imaginative powers. The fourth element of poetic fancy affects all the other three. Much that is looked upon as elaborated mythology is nothing but a naive statement of what appears to the savage as everyday facts, such as the birth of men from beasts or from the elements, the birth of animals from women, metempsychosis, the intimate relations between man and all natural objects. MYTHOLOGY IN ART. That portion of art which is concerned with the representation of mythological concepts. Religious notions are symbolized at a very early stage in the history of mankind; indeed, they form, generally speaking, the most important subject of ancient art.

Conceptions which can be given in vague and poetic terms in the literature must of necessity in art be represented concretely. The first beginnings are rude and uncouth; yet they develop in the course of time into the most beautiful of all expressions of national art. They are thus important not only from the point of view of history of art, but as one of the main sources for an accurate knowledge of the history of religion. We may trace in them also in many cases the influence which one religion has exercised upon another. If, e.g., we find the bearded figure within a circle as the Iranian symbol of Ormazd, and in Assyrian sculpture see the same figure hovering over a field of battle, it is at once evident that the religious art of Assyria has influenced that of ancient Persia, and the implication follows that the actual concept of the deity of Ormazd has been modified by a Semitic deity.

Nowhere are the distinct national characteristics of mythology so clearly set forth as in art. In the Egyptian paintings and statues of deities we have the stiff outlines and the grotesque animal-headed figures, which stand in marked contrast to the brutal and massive religious art of Assyria and Babylonia. From the point of view of comparative religion the most perfect productions of art are as a rule inferior to the rude and archaic. It might almost be laid down as a rule that the higher the artistic merit, the less the purely religious value. The most important contributions of Assyrian art to a knowledge of its mythology are to be found, not in the finished productions of the late period, but in the more ancient seal cylinders, whose purely artistic merit is often slight. In Greece, in like manner, the early religious art is rude, but here we find in the most archaic periods traces of influence from Egypt, or again, as in certain pictures of the struggle of Hercules with the Nemean lion, an analogue too close to be accidental with Babylonian pictures of the Gilgamesh cycle. Though the highest religious sentiments of a people at a given period are embodied in its art, the endeavor to make this embodiment perfect tends in the course of time to an increased purity in the type and symbolization of religious concept. This interacting process is stimulated by the fact that the statue or the painting is conceived to be in itself divine, and at a later period a portion of godhood, later still it is a symbol which may indeed be a god to the vulgar, but to the cultured or to the initiated is but a representation of divinity. Artistic conceptions of divinities naturally vary according to the character of the god represented. Thus, in ancient Mexico we find beside the figure of the beneficent Quetzalcoatl the horrible statue of the war god Huitzilopochtli, on whose altar human sacrifices were offered. In India, as well as in Mexico, in harmony with the grotesque religious legends, we find strange divine figures. The monkey god Hanuman, in harmony with his energetic character, has no touch of the effeminate about him, as has the love god Kama; and in like manner we find the voluptuous figure of Parvati, the wife of Siva, in her kindly aspect, beside the frightful and demoniac figure of Durga, the malignant form of the same goddess. In Greece, where mythology in art was developed to its utmost perfection, we find this principle carried out in its entirety. Beside the austere Athene stands the seductive Aphrodite: with the powerful

Hercules is contrasted the delicate, almost too beautiful Apollo; and over all the Pantheon towers the majestic figure of Zeus. See **ART**, *History*; the various articles on National Art; and, for illustrations, the plates of **EGYPTIAN DEITIES**; **HINDU DEITIES** under **INDIA**; **GREEK ART**; **JUPITER**; **LYSIPPUS**; **PARTHENON**.

MYTILENE, mīt'i-lē'nē (Lat., from Gk. Μυτιλήνη, Turk. *Midilli*), or **MTYLENE**. The largest island in the Ægean Sea, also known as Lesbos (q.v.) (Map: Balkan Peninsula, F 5).

MYTILENE, or **MITYLENE** (modern Kastrol, q.v., or Mitilini). The capital of the island of Lesbos (q.v.). It was colonized in very ancient times by the Æolians. Its situation on the southeast coast of Lesbos on a promontory gave it two excellent harbors (Map: Turkey in Europe, F 5). It is famous as the birthplace of Sappho and Theophrastus, among others. Of its internal political history down to the time when Pittacus became practically dictator early in the sixth century B.C., something is to be learned from the fragments of the poetry of Alcaeus (q.v.). Meanwhile the city had become the most important centre of the Asiatic Æolians and a great naval power, and had founded colonies in Mysia and in Thrace. After the Persian wars it became an important member of the Athenian Confederacy, but in 428 B.C., the fourth year of the Peloponnesian War, it rebelled against Athenian domination. Defeat after a famous struggle ended its power (427 B.C.). Mytilene fought on the side of King Mithridates in his war against Rome (88 B.C.), and after his defeat suffered for it. Very little of the ancient town remains. Perhaps the most important edifice is the Greek College, an institution which Greek boys of the entire Ægean coast attend. Consult Leithäuser, *Der Abfall Mytilenes von Athens* (Leipzig, 1874), and Cichorius, *Rom und Mytilene* (ib., 1888).

MYTILUS. See **MUSSEL**.

MYXINE, miks-i'nē (from Gk. μύξα, *myxa*, mucus). The single genus of the family Myxiniidæ, represented by the single species *Myxine glutinosa*, the hagfish or horer of the North Atlantic coast. These eel-shaped parasitic animals, which burrow into the bodies of fishes, are extraordinary in their reproductive habits. According to Nansen, *Myxine* is generally or always in its young stage a male, while at a more advanced stage it becomes trans-

EGG OF MYXINE.

formed into a female. The ovary is single and on the right side, and there are no oviducts, the mature eggs falling into the abdominal cavity and being extruded through the peritoneal opening at the side of the vent. The eggs are few and large, and each is inclosed in an oblong horny case, with threads at each end, by which the egg adheres to some fixed object until it hatches. See **HAGFISH**; and Plate of **LAMPREYS** AND **DOG-FISH**.

MYXOBACTERIACEÆ, miks'ô-bāk-tā'ri-ā'-sē-ē (Neo-Gk. nom. pl., from Gk. μύξα, *myxa*, mucus, slime + Gk. βακτήρια, *baktēria*, little rods. See **BACTERIA**, first paragraph). A group of organisms evidently related to the bacteria, but distinguished from them by a remarkably complex colony organization. The individual cells resemble those of bacteria, but

they are combined in structures of definite and even elaborate form. The name suggests a combination of the characters of the slime molds (Myxomycetes, q.v.) and bacteria, the individual cells resembling the latter, and the cells coming together to form a complex body, as the plasmodium of the slime molds is formed.

MYXCEDEMA (Neo-Lat. nom. pl., from *μύξα*, *myxa*, mucus + *οἰδημα*, *oîdéma*, swelling). A progressive disease, characterized by widespread changes in nutrition and by the invasion of the subcutaneous tissues by solid edema, dependent on diminished functional activity of the thyroid gland. It has been called *cachexia pachydermique* (Charcot), *cachexia thyroidea* (Kocher), and *hydroparesis* (Féris). Myxœdema is caused by atrophy or destruction of the thyroid gland by disease or as a result of removal of it by operation. When a sequel of thyroid removal it is called *cachexia strumipriva*. It is observed principally in women (in the proportion of 7 to 1) and is, in fact, an acquired cretinism in adult life. By far the greater number of cases occur between the ages of 35 and 45. In some families there is a distinct inheritance of a predisposition to disease of the thyroid gland. Hereditary syphilis may be a factor. The malady is seen most frequently in cold climates and is perhaps most frequent in Europe. It is rare in the tropics. The symptoms develop gradually, in most cases nearly a year elapsing before the disease becomes distinct. Among the principal symptoms are languor or indolence, absence of perspiration, loss of hair, decay of nails and teeth, a stiff gait, a thickening of the skin and of the mucous membrane of the nose, pallor, subnormal temperature, hallucinations of sight and hearing, many mental abnormalities, and even actual insanity. Incomplete myxœdema (*myxœdeme fruste*) is a state in which the symptoms are less marked or have ceased to develop. The treatment consists in feeding the patient with thyroid-gland extract or dried gland, together with tonics, such as phosphoric acid and iron. Thyroid grafting has proved efficacious, temporarily at least, in many patients. A part or the entire thyroid of an animal is transplanted into the peritoneal cavity or subcutaneous tissue of the patient, to whom the gland has been fed for some time previously, as suggested by Victor Horsley. Thyroid gland was first administered by Murray in 1891. Before the thyroid treatment was known the prognosis in myxœdema was uniformly bad, the patient dying in from 5 to 7 years, generally from some intercurrent disease. Under thyroid treatment mild cases can be cured, and in severe cases the symptoms controlled almost indefinitely. The symptoms disappear one by one with astonishing rapidity, and the transformation in the patient's appearance is one of the most remarkable phenomena in medicine. The gland, generally that of a sheep, must, however, be given with great care, degeneration of the heart or of the great vessels being an indication for very small initial dosage. In some patients profuse diarrhœa results, in others vomiting, sweating, headache, swelling of the glands about the jaw, and prostration. The remedy may be used hypodermically. After the symptoms of the disease have disappeared the patient must take a small quantity of the thyroid extract at regular intervals as long as she lives, to maintain the improved condition. See CRETINISM. Consult G. R. Murray, *Diseases*

of the Thyroid Gland (London, 1900), and Dock, "Diseases of the Thyroid Gland," in Sir William Osler, *Modern Medicine* (New York, 1915).

MYXOMA, miks-ô'mâ (Gk. *μύξα*, *myxa*, mucus + *-ωμα*, *ôma*). A tumor consisting of a gelatinous substance composed of mucin and peculiar branched or stellate cells. It is classed with the connective tissue tumors and has a jelly-like consistency. See TUMOR.

MYXOMYCETES, miks-ô-mî-sê'têz (Neo-Lat. nom. pl., from Gk. *μύξα*, *myxa*, mucus + *μύκης*, *mykês*, fungus). A group of organisms commonly called slime molds. Certain phases of their life history are very animal-like, but the spore case (with its spores) has many plant characteristics, and as the forms are described and classified by the spore cases, the work has naturally fallen within the province of botany. They are here treated as one of the great groups of the fungi (q.v.). The spores germinate in moist situations on the soil and in humus, giving rise each to a motile naked cell provided with a cilium (Figs. 6, 7, 8). These swarm cells swim around in the moisture, increasing in number by division (fission). After an active period they lose the cilia and creep around like amœbæ (Figs. 1, 2, 3), finally approaching one another and fusing in pairs, or perhaps several together. Such fused groups become centres of attraction to many hundreds of swimmers, which contribute their substances to the common mass. The result is a large protoplasmic body, called a plasmodium (Fig. 9), which moves over the surface of the humus and into crevices like a gigantic amœba. Its food is largely bacteria and other fungi, which are taken directly into the protoplasmic body and digested, the hard and worthless portions being discarded.

Vegetating plasmodia shun the light and seek moisture. But these habits are reversed when the spore cases are to be formed, the plasmodia then come to the light and take position in the

MYXOMYCETES.

Chondrioderma. 1, 2, 3, amœboid stage, 4, 5, resting stage, 6, 7, 8, motile stage, 9, plasmodium of *Stemonitis*, 10, sporangia.

driest situations that they can find. This is the time when plasmodia are most conspicuous and are frequently found on stumps, bark, and humus. The largest plasmodia may cover several square inches, but most of them are much smaller, and some are no larger than a pinhead

The form of the spore cases is exceedingly various, some being large and irregular and others having extraordinary delicacy and complexity of structure, but the general history of spore formation is much the same. The plasmodium excretes a great deal of material (and frequently mineral matter) which forms the wall of the spore case (sporangium) and its stalk if present (Fig. 10). A filamentous network called the capillitium may also be developed inside the spore case, its function being to distribute the spores. The protoplasm which remains after these activities divides up into minute rounded bodies which, investing themselves with walls, become the spores. The plasmodia of slime molds have always been favorite subjects of observation by physiologists, who find in such

specimens the largest masses of protoplasm that can be studied.

Consult, for a general account, Engler and Prantl, *Die natürlichen Pflanzenfamilien* (Leipzig, 1887); and for special descriptive treatment, Anton Bary, *Comparative Morphology and Biology of Fungi, Mycetozoa, and Bacteria* (Eng trans., Oxford, 1887); Lister, *A Monograph of the Mycetozoa* (London, 1894); T. H. McBride, *The North American Slime Moulds* (New York, 1899); W. C. Sturgis, "Guide to the Botanical Literature of the Myxomycetes from 1875 to 1912," in *Colorado College, Publications, Science Series*, vol. xii (Colorado Springs, 1912).

MYZONTES, mí-zón'téz. Same as *Cyclostomi* (q.v.).

N

N The fourteenth letter and eleventh consonant of the Roman alphabet. This character has varied very little in form and not at all in value since the origin of the alphabet. The original letter was apparently called *nun*, which in Phœnician and in the North Semitic languages signified 'fish'. Apparently the early pictographic character represented a fish. The small *n* is an outgrowth of the sign used in the Latin uncial alphabet which was a modification of the capital alphabet. See ALPHABET.

Phonetic Character. *N* stands for the dental or alveolar nasal sound which is the equivalent to *d* and *t*. The sound is produced by a check or mute contact and sonant vibration of the vocal cords as in *d* with the addition of the opening of the nasal passage made by lowering the soft palate. The size and shape of the resonance chamber make the difference between *n* and the other nasal letters. Under certain conditions *n* may have a syllabic or vocalic value, as in *rotten*, *forgotten*. In scientific linguistics this value is represented by *n*. It is sometimes silent after *m* or *l* in words usually of Latin origin, as in *damn*, *hymn*, *autumn*, *kiln*. Before *g*, *k*, *ch* it receives a semiguttural or palatal coloring to harmonize with the consonant it precedes, as in *long*, *think*, *pinch*. Though in Latin or Greek a final *n* of a prefix was usually assimilated to the value of a following consonant, in English it is much more stable (*unleaven*, *unbalance*, *unpack*). Among the nasals the lingual dental *n* is by far the most frequently used in English, more than twice as often as *m*.

Source. In its historic development *n* represents an original *n* which has been preserved with great constancy through the Indo-Germanic period to the present time. Thus, *night*, Gothic *nahts*, Skt. *nakti*, Lat. *nox*, or again Indo-Ger. **nevos*, new, Skt. *navas*, Gk. *neós*, Lat. *novus*, Goth. *nuijis*, Ger. *neu*, Eng. *new*. In Anglo-Saxon an original Germanic *n* disappears before *s*, *f*, and *þ*.

As a Symbol. As a numeral *N* = 90 and *N̄* = 90,000. In chemistry *N* = nitrogen, *Na* = sodium (i.e., natrium). In mathematics *N* = an indefinite constant whole number, especially the class of a curve or the degree of an equation.

Eduard Stucken, *Der Ursprung des Alphabets und die Mondstationen* (Leipzig, 1913). See ALPHABET, LETTERS. LIQUID, NASALS.

NABA, na'ba. A seaport of Japan. See NAWA.

NABAB, ná'bab', LE (Fr. The Nabob). A story by Alphonse Daudet (1877), based on the career of a contemporary adventurer.

NAB'ATÆ'ANS (Gk. *Nabataioi*, *Nabatai*, Ar. *Nabatu*). An Arab people or tribe settled in various parts of the country east and south-east of Palestine, who formed during the Græco-Roman period a petty independent kingdom. Their history is known to us from classical authors, especially Diodorus and Josephus, as well as from numerous coins, and from inscriptions, dating from 169 B.C. to 105 A.D., which have been collected by De Vogüé (1868), Doughty (1884), Huber (1884), and Euting (1885). They are located at various places from the Hauran in the north to Madain Saláh (Al Hiir in northern Arabia) in the south. The Arabic character of the Nabatæans is evinced by their proper names, though they used a western Aramaic language and script, as the northern Arabic had not yet been reduced to writing. It is uncertain whether they are to be connected with an Arabic tribe descended from Nabathoth, mentioned together with Kedar as a son of Ishmael (Gen. xxv. 13, xxxviii. 9, xxxvi. 3, I Chron. i. 29, Isa. lx. 7) and several times referred to as *Nabathati* in the Assyrian inscriptions of Tiglath-pileser, Sargon, and Asurbanipal. The Nabatæans are first met with about 312 B.C. at Petra as nomads, but they were so strongly intrenched here that the generals sent against them by Antigonos, Athenæus, and Demetrius were unable to dislodge them. Though they were nomads they had an extensive trade in myrrh and spices from Arabia Felix, which they sent to the seaports, and in bitumen from the Dead Sea, which they sent to Egypt. The Nabatæan Kingdom arose in ancient Edom upon the ruins of the Seleucid and Ptolemaic empires. Its first prince was Aretas I, to whom the high priest Jason fled in 169 B.C. Its first King was probably Erotimus (Tam-Allat, 110-100 B.C.). Obedas I (90 B.C.) was able to hold his own against Alexander Jannæus, and Aretas III (Philellenos) against Antiochus XII of Cœle-Syria. The latter even conquered Damascus, but was driven out by the general of Pompey. Antony presented part of the land of the Nabatæans to Cleopatra. When Malchus I (50-28 B.C.) refused to pay tribute, his land was overrun by Herod. War broke out between

Herod and Aretas IV (9-40 A.D.), in which the Nabatæans were successful. When Paul was in Damascus that city must have been once again in the power of the Nabatæans (2 Cor. xi. 32). At the time of the Emperor Claudius, King Abias undertook an expedition against Adiabene, but he was beaten back. Damascus was lost to Nero in the reign of Maelchus II (48-71). The last King of the Nabatæans was Rabel II (71-106). In 106 Cornelius Palma, Governor of Syria, made the region from Petra in the south to Bostra in the north into a Roman province. In the fourth century two provinces were created—Arabia with Bostra as a centre and Palestina tertia with Petra as a centre. The latest inscriptions in Nabatean characters are those of Al Namarah (328), Zebed (512), and Harran (568), but the language is purely Arabic. Later Arabic writers use the word Nabatean as the equivalent of Aramæan. The importance of the Nabatæans is due to the fact that they formed a sort of buffer state against the Arabs of the desert and because their country lay in the direct line of the caravan route from Arabia to Syria. Al Hijr was an emporium for the products of Yemen, and many mausoleums built in the rocks and beautifully carved are evidence of the riches which were concentrated here. The national temple was also situated at this place. The chief gods of the Nabatean Pantheon seem to have been Dushares (*Dhu al Shara*), Manat, Kais, Allat, and Hoba. Consult J. Euting, *Nabatäische Inschriften aus Arabien* (Berlin, 1885), Emil Schürer, *History of the Jewish People*, vol. i (Eng. trans., New York, 1896), René Dussaud, *Les Arabes en Syrie* (Paris, 1907), Brunnow and Domszjewski, *Die Provincia Arabia* (3 vols., Strassburg, 1904-09), Hermann Thiersch, *An dem Rande des römischen Reiches* (Munich, 1911), and the article "Nabatæer," in Friedrich Lübke, *Reallexikon des klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914).

NABBES, nābz, THOMAS. An English dramatist of the seventeenth century, born in Worcestershire. His first comedy, *Covent Garden*, was produced in London in 1632-33. His second attempt, *Tottenham Court* (1633), was followed by *Hannibal and Scipio in Historical Tragedy* (1635) and a comedy called *The Bride* (1638), but more talent was displayed in his masques, two of which were published in 1639 under the title *The Spring's Glory*. An edition of his works was published by Bullen (London, 1887; *Old English Plays*, n. s., vols. i and ii).

NABHA, na'bā. An eastern native state of the Punjab, India (Map. India, C 2). Area, 966 square miles. It produces wheat, pulse, and barley. Pop., 1901, 297,949, 1911, 248,887. Capital, Nabha.

NABIGHA, na'bē-gā, ZIYAD IBN MUAWIYA AL DHUBYANI. A famous pre-Islamic poet. Nabigha seems to be a surname indicating that his genius "jets forth vigorously and abundantly." He lived at the courts of Mundhir II, Mundhir III, and Nu'man ibn Mundhir. A too enthusiastic description of Queen Mutajarrida's charm forced him into exile. He became the court poet of Amr ibn Harith of Ghassan, but was finally reconciled to Nu'man. He differs from most of the Arabic poets of the period in being a man of profound religious sentiment. His *Divan* has been published by Derenbourg (Paris, 1868-69). Consult Carl Brockelmann, *Geschichte der arabischen Literatur*, vol. i

(Weimar, 1898), and R. A. Nicholson, *A Literary History of the Arabs* (New York, 1907).

NABLUS. See NABULUS.

NA'BOB, or **NA'BAB** (Hind., Ar. *nawwāb*, deputy, from Ar. *nāba*, to replace, to be a deputy). Under the Mogul Empire of India, the administrator of a province comprised in the region ruled by a *subahdar*, or viceroy. The title was continued under the British rule, but gradually was applied to unofficial wealthy natives. In the United Kingdom and other European countries it is applied derisively to Euro-Indians who, having amassed fortunes in India, return to make an ostentatious display of their wealth.

NABONASSAR (Assyr. *Nabu-nasir*, Nabu (or Nebo) protects). King of Babylonia (747-734 B.C.). His contemporary in Assyria, Tiglath-pileser IV (745-728 B.C.), succeeded with the help of the Aramæan hordes that at all times were a menace to Babylonian security in obtaining complete control of Babylonia, and emphasized his success by giving himself in his inscriptions the title of King of Sumer and Accad and by worshipping at the shrines of the Babylonian gods in the most important cities of the south: Sippar, Nippur, Babylon, Borsippa, Cutha, Kish, Dilbat, and Erech. It is evident, therefore, that Nabonassar must have been merely a vassal to Tiglath-pileser IV, but a semblance of independence was permitted to Babylonia because of a desire on the part of the Assyrian rulers to deal leniently with the old Empire in the south for fear of incurring the displeasure of the Babylonian gods who were also the gods of Assyria. His name is preserved in the Ptolemaic canon, whose list of Babylonian kings begins indeed with Nabonassar. Why the beginning should have been made with this ruler is not clear. It has been supposed that the Babylonians began a new era—historical or astronomical—at the time of Nabonassar, since that date was adopted as a new astronomical era by the Greeks, but there is no direct evidence. Equally mysterious is Berosus' statement, preserved by Syncellus, that Nabonassar first collected and then destroyed the chronicles of his predecessors. Consult R. W. Rogers, *History of Babylonia and Assyria*, vol. ii (New York, 1900), C. H. W. Johns, *Ancient Assyria* (ib., 1912); id., *Ancient Babylonia* (ib., 1913).

NABONIDUS (Assyr. *Nabu-na'id*, Nabu (or Nebo) is exalted. Herodotus (i. 74, 77, 188) has erroneously *Λαβύνητος*, *Labynētos*). The last King of the Chaldean Empire, sixth in order of succession from Nabopolassar (qv), the founder of this Empire. He was the son of a priestess of Sin at Harran and came to the throne in 556 B.C. as a result of a conspiracy formed apparently by the priests of the city of Babylon against Labashi Marduk (Gk. *Labosoarchod*), the son of Nergalsharzur (Gk. *Neriglossor*), which cost Labashi Marduk his life. Nabonidus was a native Babylonian and not, as his predecessors since Nabopolassar, a Chaldean. In his inscriptions, of which a large number have been found, he appears chiefly in the light of a builder and restorer of the sacred edifices in such ancient centres as Ur, Harran, and Sippar. While he did not neglect the sanctuaries of Marduk and Nebo at Babylon and Borsippa, yet his greater devotion to other centres appears to have aroused the opposition of the priests and of the population of Babylon,

and the neglect of suitable preparation to resist the threatening advance of Cyrus (q.v.) is probably to be ascribed to internal dissensions. In the beginning of his reign the Medes under Astyages attempted to add Mesopotamia to their Assyrian province, but were driven away from Hairan by Nabonidus. After the conquest of Media by Cyrus in 553, this King occupied himself with Cræsus of Lydia until Sardis fell in 546, whereupon he turned against Babylonia. Nabonidus was a man of sincere piety who sought by zealous worship of the gods to avert the danger to the state. He rebuilt the ancient temples everywhere and dug in their foundations for the inscriptions of earlier kings. To the researches of his scribes and the excavations of his officials we are indebted for much information. It is not clear whether Nabonidus removed the images of the gods from other cities to Babylon in order to centralize all worship there or to save them. The great inscription of the Marduk priests plainly shows that they were plotting with Cyrus and that the city was delivered to Gubaru through their treachery. Babylon fell, as a Babylonian chronicle puts it, "without battle," in December, 539. Two days before, Nabonidus had to flee from the battle of Opis, as the army deserted to Gubaru, the Governor of Guti, who had sided with Cyrus and led the enemy to Babylon. Belshazzar (see BELSHAZZAR), the Crown Prince, is mentioned with the King in an oath of the year 12 (i.e., 544 B.C.) and elsewhere. What became of him is not known. In 538 Cyrus himself entered the city in triumph. Nabonidus was banished to Karmania, and Gubaru-Gobryas remained for several years governor of the city of Babylon. Consult R. W. Rogers, *History of Babylonia and Assyria* (New York, 1900), and the Babylonian-Assyrian histories of F. Hommel (Berlin, 1885), C. P. Tiele (Gotha, 1886), H. Winckler (Leipzig, 1892), A. H. Sayce (London, 1900), C. H. W. Johns (London, 1911), also Scheil, in *Revue d'Assyriologie*, vol. xi (Paris, 1914); T. G. Pinches, "Fresh Light on Daniel," in *Expository Times* (London, 1915).

NAB'OPOLAS'SAR (Assyri. *Nabu-apal-uzur*, Nebo, protect the son) The founder of the Chaldean Empire, King of Babylonia 625-605 B.C. He was not of royal birth, as is indicated by the absence of any reference to his father in the inscriptions that we have of him. By his own efforts he rose to a position of supremacy over the district of Chaldea lying to the south of Babylonia proper as far as the Persian Gulf, which had managed even during the height of the Babylonian Empire to retain a certain measure of independence, and whose separate position continued to be recognized by the Assyrian kings when Babylonia had come under the control of Assyria. At various times the Chaldeans made attempts to regain their independence, and the growing weakness of Assyria after the death of Asurbanipal in 626 B.C. furnished the desired opportunity for the Chaldeans to reassert themselves and to extend their control from Chaldea to Babylonia. Nabopolassar refused to recognize Asurtilianiukin, declared himself independent, and apparently entered into an alliance with Cyaxares of Media and Psammetichus of Egypt against Assyria. Nineveh was saved in 625 by the prompt appearance of Assyria's ally, the Scythian King Madyas, who drove away the Medes. But about 606

B.C. Nabopolassar, with the aid of the Medes, brought about the fall of Nineveh and the destruction of the Assyrian Empire. The Chaldean Empire now became the controlling influence in the Euphrates valley, though Assyria proper had fallen to the share of Media. The few inscriptions of Nabopolassar which have been found show him to have been a man of force and energy, who managed not only to maintain his position against great odds, but to hand over to his son, Nebuchadnezzar, an empire almost as extensive and as powerful as was that of Assyria in her best days. He improved and enlarged the famous temple of Marduk in Babylon, and the sanctuaries of Shamash, the sun god, and of Belit at Sippar, and constructed a canal at the latter place to bring the waters of the Euphrates to the city walls. The Chaldean origin of the last Babylonian Empire led to the use of the term Chaldea among classical writers for Babylonia. See BABYLONIA. Consult R. W. Rogers, *History of Babylonia and Assyria* (New York, 1900), and the Babylonian-Assyrian histories of F. Hommel (Berlin, 1885), C. P. Tiele (Gotha, 1886), H. Winckler (Leipzig, 1892), A. H. Sayce (London, 1900), C. H. W. Johns (ib., 1911).

NA'BOOTH. The owner of a parcel of land, described as a vineyard, in Jezreel, adjoining the palace of Ahab, King of Israel. When the latter proposed to buy the land Naboth refused to sell (1 Kings xxi 1-14). Thereupon the Queen, Jezebel, is charged with having forged letters in the name of the King, exhorting the elders of his city to secure false witnesses who should swear that they had heard Naboth curse God and the King. Naboth was indeed put to death, and the King took possession of the land. For this Elijah denounced Ahab and predicted the downfall of his house, without suggesting, however, that the Queen was implicated in the crime. Probably the charge against the foreign Queen was popularly believed, and the barbarous murder of Jezebel was justified by it (1 Kings xxi, 2 Kings ix 21 ff). The story is interesting for the hints it gives as to local customs and popular ideas in Israel in the ninth century B.C. See AIIAB; JEZEBEL.

NABU, na'bōō. See NEBO; NERO, MOUNT.

NABUA, na'bōō-a. A town of south Luzon, Philippines, in the Province of Ambos Camarines, 21 miles southeast of Nueva Cáceres. It is situated in a low, marshy region occupied by rice fields. The surrounding country produces rice. Pop., 1903, 18,893.

NABUCO, na-bōō'kō, JOAQUIM (1849-1910). A Brazilian diplomat and writer, born at Recife. He was educated for the law, receiving his degree in 1871. He began his public career as attaché of the Brazilian legation in Washington. Returning to Brazil he was elected to Parliament in 1878 and was active in the cause of the abolition of slavery, visiting Rome in 1888 to obtain the support of the Pope for this measure. Having been closely identified with the Imperial régime, he held aloof from politics for a number of years after the establishment of the Republic in 1889. During this period he devoted himself to literary and historical studies and wrote his most important work, a constitutional history of the reign of Dom Pedro II. He again entered public life in 1899, serving on the commission to settle the boundary

dispute between Brazil and Great Britain. In 1901 he was named Minister to England and from 1905 to his death was the first Ambassador from Brazil to the United States. Active in the promotion of Pan-Americanism and in the development of a better understanding between the American nations, in 1906 Nabuco was president of the Third International Conference of American States at Rio de Janeiro. He was also a member of the Permanent Court of Arbitration at The Hague. Both in politics and in literature he showed himself an idealist. He was besides an able orator and was often called upon to deliver addresses both in his native land and in the United States. His writings, which have taken very high rank and show Anglo-Saxon and French influence, include *Balmaceda* (1895), *A intervenção estrangeira durante a revolta* (1896), and *Pensées détachées et souvenirs* (1906). Consult M. Oliveira Lima, "Ecrivains Brésiliens contemporains," Joaquim Nabuco," in *La Revue*, vol. lxxxvii (Paris, 1910).

NABULUS, na'bu-lōōs', or **NABLUS** (a contraction of *neapolis*, the new town). One of the chief cities of modern Palestine, the ancient Shechem (q v), by which name it is also known now geographically the centre of Palestine. It is situated about 35 miles north of Jerusalem, in a well-watered and productive valley, between the mountains Jebel esh-Shemali (Ebal) on the north and Jebel et-Tor (Geizim) on the south. The city is renowned for the large number of its perennial springs. It is the seat of government for central Palestine and the corresponding region beyond the Jordan, the residence of a Greek bishop, has several mosques and Mohammedan schools, and English and Latin mission establishments. The irrigation system built around the town is one of the most elaborate in Palestine. It has considerable industries, especially the manufacture of soap, and carries on a lively trade with the east-Jordan country and Jaffa. It has about 24,000 inhabitants, most of whom are Mohammedans who bear the reputation of being fanatical. The surviving remnant of the Samaritans, to the number of about 200, are believed to occupy the southwest part of the town. See SAMARITANS.

NA'CHI. See NATCHEZ.

NACHTIGAL, na'k'tē-gal, GUSTAV (1834-85). A German explorer, born at Eichstedt, near Stendal. He studied medicine at Halle, Würzburg, and Greifswald. He practiced as a military physician in Cologne and in 1863 went for his health to northern Africa, where he became a physician in the service of the Bey of Tunis. In 1869 he was commissioned by the King of Prussia to carry some gifts to the Sultan of Bornu in recognition of the latter's services to various German explorers. After a journey in the Tibbu country he set out for Kuka, the capital of Bornu, where he arrived in 1870. He made a thorough exploration of Bornu, then went to Lake Chad. Making his way to Bagirmi, he followed up the Shari River and its tributaries. In the spring of 1874 he set out for Egypt, going through Wadai, which he was the first European to penetrate. He visited Abeshr, the capital of Wadai, passed through Darfur, and arrived at Cairo in November, 1874. In 1875 he returned to Europe, where his explorations had made him famous. In 1884, as German Imperial Commissioner, he visited the west coast of Africa, where his explorations resulted in the acqui-

sition by Germany (lost in the war in 1915) of Togoland, Kamerun, and Lüderitzland. Before finishing his labors, however, he was taken sick and died. His greatest work, *Sahara und Sudan*, was published in 1879-89. Consult Ruhle, *Gustav Nachtigal* (Münster, 1892).

NACOGDOCHES, nāk'ō-dō'chēz. A city and the county seat of Nacogdoches Co., Tex., 138 miles north by east of Houston, on the Houston, East and West Texas and the Texas and New Orleans railroads (Map. Texas, E 4). It has lumber mills, cotton gins, cotton compress, cottonseed-oil mill, brick plants, grain elevators, saw mills, etc., and, as the commercial centre of a productive cotton-growing and farming region, controls wholesale interests of importance, and a trade in cotton, produce, live stock, tobacco, hides, and lumber. Noteworthy features are the public library, county courthouse, high school, Old Stone Fort, park, and the Aqua Vita Mineral Wells. The water works and electric-light plant are owned by the city. Pop., 1900, 1827, 1910, 3369. Nacogdoches owes its origin to a Spanish mission, established here early in the eighteenth century. As an outpost against American encroachment it played a part in the controversy between Spain and the United States over the Spanish possessions in the Southwest. It was captured in 1812 by an American filibustering party under Magee and Gutierrez.

NADAL', EHRMAN SYME (1843-). An American author, born at Lewisburg, W. Va. He graduated at Yale in 1864, was second secretary of the United States Legation at London in 1870-71 and 1877-83, and after 1884 was for several years a member of the staff of the New York *Nation*. He lectured on English composition at Columbia University in 1892-93. His publications include *Impressions of London Social Life* (1875); *Essays at Home and Elsewhere* (1882); *Zuleikha: Notes of a Professional Exile* (1895). He also contributed in similar vein to reviews and other periodicals, and was a contributor to the NEW INTERNATIONAL ENCYCLOPEDIA.

NA'DEN, CONSTANCE CAROLINE WOODHILL (1858-89). An English poet, born at Edgbaston, Birmingham. She attended classes in science at the Birmingham and Midland Institute and at Mason College, and became a close student of Herbert Spencer, on whose philosophy she frequently gave lectures. Miss Naden published two volumes of poems *Songs and Sonnets of Springtide* (1881), and *A Modern Apostle and other Poems* (1887), containing pieces, as "The Pantheist's Song of Immortality," that give her an assured place among the lesser poets. Consult the *Memor* by W. R. Hughes and others (London, 1891); *Induction and Deduction*, a prize essay, ed. by Lewins (ib., 1890); and *Complete Poetical Works*, ed. by Lewins (ib., 1894).

NA'DIR (Ar. *nazir*, similar, corresponding (i.e., to the zenith), from *nazara*, to behold, to be face to face). That point in the heavens which is diametrically opposite to the zenith, so that the zenith, nadir, and centre of the earth are in one straight line. The zenith and nadir are 90° distant from every part of the horizon (q v). See ZENITH, MERIDIAN CIRCLE.

NADIR SHAH, nā-dēr' shā (1688-1747). A king of Persia. He belonged to the Afshars, a Turkish tribe. He was born near Kelat, in the centre of the Persian Province of Khorasan.

At the age of 17 he was taken prisoner by the Usbek Tatars, but, escaping after four years of captivity, he entered the service of the Governor of Khorasan, and soon obtained high promotion. Having, however, been degraded and punished for some real or supposed offense, he became an outlaw and for several years was the leader of a band of 3000 robbers. At this period the Persian throne was occupied by a usurper, Mir Vaiz, of the Afghan tribe of Ghilzai, who were bitterly hated by the Persians for cruelty and oppression. In favor of the rightful heir, Tahmasp II, Nadir took up arms against Malik Ashraf, the successor of Vaiz, and in token of his loyalty assumed the name of Tahmasp Kuli, or Slave of Tahmasp. Defeating the usurper in a series of engagements, he freed the provinces of Irak, Fars, and Kirman of even the semblance of Afghan domination. The assassination of Ashraf during his retreat terminated the war. Tahmasp then ascended the throne, and Nadir received for his services the government of the provinces of Khorasan, Mazanderan, Seistan, and Kirman. He was sent against the Turks in 1731, and defeated them at Hamadan, regaining the Armenian provinces which they had seized in the preceding reign. Meanwhile Tahmasp himself had been unsuccessful in his operations against the Turks. Nadir took this as a pretext to imprison the Shah, whose infant son, Abbas II, he placed on the throne in 1732. The death of this puppet, in 1736, opened the way for the elevation of Nadir himself, who was crowned as Nadir Shah, Feb. 26, 1736. To win the support of the Afghans, the new ruler declared the Sunnite form of Mohammedanism to be the state religion instead of the Shiite, which has always been favored by the Persians. Nadir resumed the war with the Turks, and, though totally defeated in the first two battles by the Grand Vizier Asman, turned the tide of fortune in the subsequent campaign, and granted peace to the Turks on condition of receiving Georgia. He also conquered Afghanistan, and drove back the invading Usbeks. His ambassador to the Great Mogul having been murdered together with his suite at Jalabad, and satisfaction having been refused, Nadir, in revenge, ravaged the Northwest Provinces and took Delhi, the capital of the Great Mogul, which was pillaged against his will (1739). With booty to the amount of \$400,000,000, including the Koh-i-nur (qv) diamond and the famous peacock throne, he returned to the west bank of the Indus. He next reduced Bokhara and Khwarezm, restoring to Persia her limits under the Sassanids, and formed plans, which were never realized, for making Persia a maritime power. Embittered by an attempt to assassinate him in 1741, of prompting which he suspected the heir apparent, Riza-kuli, whom he blinded and imprisoned, Nadir's character underwent a sudden change. Formerly open-hearted, liberal, and talented, he became suspicious, avaricious, and tyrannical. He was assassinated on June 20, 1747, by Salah Bey, captain of his guards, and was succeeded by his nephew, Ali, who ascended the throne as Adil Shah, or the "righteous king," but was deposed within a year. Consult H. Maynard, *Nadir Shah* (Oxford, 1885), and Sir H. M. Durand in the *Journal of the Asiatic Society* (London, 1908).

NADLER, nă'dlēr, KARL CHRISTIAN GOTTFRIED (1809-49). A German poet, who wrote

in the dialect of the Rhenish Palatinate. He was born at Heidelberg and studied law there and at Berlin. His poems, under the title *Frohlich Palz, Gott erhalte* (1847; 8th ed., illustrated, 1882; also No. 3369 et seq., Reclam ed.), were excellent pieces of genre verse, the drinking songs being peculiarly rollicking and musical. Consult the *Allgemeine deutsche Biographie*, vol. xxiii (Leipzig, 1886).

NADSON, nat'sŏn, SEMION YAKOVLEVITCH (1862-87). A Russian lyric poet of Jewish extraction. He was born in St. Petersburg, but spent his early childhood at Kiev. Left an orphan at 10, Nadson was sent in 1879 by his uncle to the Pavlov Military School. Military life proved so distasteful to him, however, that in 1884 he gladly accepted a modest position on a St. Petersburg weekly journal. A sojourn abroad could not check the tuberculosis which had set in very early, and Nadson died at 25. His brief literary career began in 1878, with a poem ("At Dawn") which appeared in a Russian periodical. A volume of collected verse was published in 1885 (17th ed., 1899). Other works were *Literary Sketches of 1883-86* (1886, 2d ed., 1887), reviews and other current comment; *Unfinished Sayings* (1902), posthumous papers; and *Prose* (1912), diary, letters, and an autobiographical sketch. Nadson lacks the energy, the eloquence, and the national sentiment of some of the great Russian poets. Piecemeally a poet of youth, of dreamy ambitions and idealism, he owed his large contemporaneous popularity to a reaction from the social and moral disillusionment of the time. But his verse, melodious and plastic, tender and sincere, will make an appeal to all lovers of poetry. Consult R. Newmarch, *Poetry and Progress in Russia* (New York, 1907).

NAEGLI, nă'ge-lē, KARL WILHELM (1817-91). A Swiss botanist, born in Kilchberg, near Zurich. After studying at Zurich, Geneva, and Berlin he began in 1842 to teach botany in Zurich, was made extraordinary professor in 1848, full professor at Freiburg in 1852 and at Zurich in 1855, and finally was appointed to the chair of botany at Munich in 1858. The name of Naegeli is one of the greatest names in the history of botany. Sachs said of him, "He laid the foundation of knowledge in every department of botany." The extent and importance of his work cannot be indicated in a brief sketch. He is known especially for the theory of cell formation, the micellar theory, growth by intussusception, classification of tissues on the basis of development, and a theory of evolution which he called progressive evolution, but which is now better known as orthogenesis. In cooperation with Schleiden he founded in 1844 the *Zeitschrift für wissenschaftliche Botanik*, in which was published his discovery of sperms in ferns, his *Zellenkerne, Zellenbildung, und Zellenwachstum* (1844-46). Among his most notable contributions were: *Neuen Algensysteme* (1847), *Die Stärbekörner* (1858), *Die Theorie des Capillarität* (1866); *Das Mikroskop* (1867); *Die modernen Palze* (1877).

NÆVIUS, GNÆUS. One of the earliest Latin poets, born in the earlier half of the third century B.C. Some, on the basis of Aulus Gellius (i, 24, 1), have thought he was born in Campania; he may well, however, have been born in Rome, and so have been a Roman citizen by birth. In his youth he served in the First Punic War, but later made his appearance at Rome as a

dramatic writer (235 B.C.). He was very decidedly attached to the plebeian party, and in his plays satirized and lampooned the Roman nobles with extreme virulence. His rashness ultimately caused his banishment to Utica in Africa (204), where he died after 200. Besides his dramatic writings, comprising both tragedies and comedies, he wrote an epic poem, *De Bello Punico*, in the old Saturnian metre. He was most successful in comedy. Of the plays only a few fragments are extant, but these testify to his vigorous and independent Roman spirit. Evidence of his originality is seen (1) in the fact that his epic dealt with a Roman subject, independently (it was not a translation from the Greek, as the epic of Livius Andronicus had been), and (2) in the fact that he attempted tragedies based on Roman history. See **LATIN LITERATURE** 11, *The Early or Pre-Classical Period*. The fragments may be found in Bothe's *Poetarum Latinorum Scenicarum Fragmenta* (Halberstadt, 1824), Klussmann's collection of the same (Jena, 1843); Müller's *Livii Andronicus et Cn. Naevii Fabularum Reliquiae* (Berlin, 1885); or Ribbeck's *Scenicae Romanorum Poesis Fragmenta*, 2 vols (3d ed., Leipzig, 1897-98). The fragments of his *Bellum Punicum* may be found in J. Wordsworth, *Fragmenta and Specimens of Early Latin* (Oxford, 1874); L. Havet, *De Saturno Latinorum Versu* (Paris, 1880); C. Zander, *Versus Italici Antiqui* (Lund, 1890). Consult W. Y. Sellars, *Roman Poets of the Republic* (3d ed., Oxford, 1889); J. W. Duff, *A Literary History of Rome* (London, 1909); Martin Schanz, *Geschichte der römischen Literatur*, vol. 1, part 1 (3d ed., Munich, 1907); F. Leo, *Geschichte der römischen Literatur*, vol. 1 (Leipzig, 1913).

NÆVUS (Lat., mole, wart, birthmark), or **BIRTHMARK**, **MOTHER'S MARK**. A congenital mark upon the skin consisting of the product of excessive development of fibrous tissue, hair, blood vessels, or pigment in a circumscribed area. The term is generally and perhaps more properly limited to a variety of angioma, or vascular tumor, usually of small size, composed of enlarged capillaries which communicate freely with other capillaries of the skin. The ordinary form of naevus is the *vasculosus*. This is present at birth or appears during the early months of the child's life, presenting itself as a red stain, or a diffuse flat patch, somewhat elevated above the surrounding surface. It may be a punctate spot, or may cover the side of the face or even the neck and chest, e.g. This variety is called port-wine mark, wine stain, *tache de feu*, or *feurmal*. The *naevus araneus*, or spider cancer, is not a cancer, but an angioma, consisting of a central elevated red point from which radiate dilated vessels so that there is a rough resemblance to a star. It is commonly single and occurs usually in children of about a year or two years old, and is generally situated on the nose or cheeks. The naevi of vascular variety are found in the papillary layer of the upper part of the corium, and consist of irregularly intertwined and dilated capillary vessels of new growth with free anastomosis. In some there is a layer of connective tissue found encircling the vessels, or an enormous growth of connective tissue, so that the result may resemble elephantiasis (q.v.). The treatment for the removal of naevi is surgical. Excision with the knife, ligature, transfixion of the growth with a cataract needle, compression by means of pads

retained in place with a rubber band, chemical caustics, such as nitric acid or the acid nitrate of mercury, multiple linear scarification, X rays, treatment with radium, electropuncture, and electrolysis are the means employed, the last named being the best method of procedure. Vaccination directly upon the naevus is an obsolete means of removal. Port-wine marks may be removed by creating several minute cicatrices with the electric needle. Entire removal of an elevated mass may be effected by electrolysis, as in the case of a tumor (q.v.). Superficial naevi are satisfactorily destroyed, without scarring, by the application of carbon dioxide snow.

NAFELS, nâ'fêls. A village in the Canton of Glarus, Switzerland, on the Linth, 4 miles north of the city of Glarus (Map: Switzerland, D 1). It was the scene of a famous battle, in 1388, in which 400 natives defeated an Austrian force of fifteen times their number. In 1799 the French under Molitor met and defeated the Russians who were trying to press their campaign into France. The village manufactures cotton, printing and iron construction material. Pop., 1910, 2818.

NAFTIA, nâ'f'tê-â, LAGO, or LAGO DEI PALICI. A small lake in Sicily, near Palagonia, in the Province of Catania. It is situated in a plain, near craggy hills, in an ancient crater about 500 feet in circumference. At several points in the centre the water bubbles violently, sometimes rising to the height of 2 feet or more under the pressure of the outpouring of carbonic-acid gas. The water is greenish, or turbid, and has an odor of naphtha. The atmosphere is fatal to birds attempting to fly across the surface of the lake and to small animals which approach it to satisfy their thirst; while to lean over it is believed to produce dizziness and headache in man. The ancients regarded these phenomena with great dread. Here were worshiped by the Siculi, the pre-Greek inhabitants of the island, a pair of chthonic gods of mighty power, called commonly by the Romans Palici (Gk. Παλικοί). In the great servile revolt against Rome (104 B.C.) the temple here was the headquarters of the conspirators. Consult E. A. Freeman, *History of Sicily*, vol. 1 (Oxford, 1891).

NAGA, nâ'gâ (Skt *nāga*, serpent). In Hindu mythology, a member of a fabulous race of semi-divine serpents with human faces but reptile forms, inhabiting the lower world (Nāga-loka, world of serpents), where their capital, Bhogavati, was a scene of magnificence and splendor. They were 1000 in number, and Sesha, the sacred serpent of Vishnu, was their king. In one of his preexistences the Buddha saved the life of a Naga, and in his last existence he often had relations with them. The name Naga was applied also to an actual race of people in Central India, perhaps so called from their worship of serpents, and this people has left historical traces, although fable and myth doubtless become mixed in allusions to the serpent race. See **NAGAS**.

NAGA. A town of Cebu, Philippines, on the east coast, 12 miles southwest of Cebu. It is a port of call for steamers and coasting vessels. Pop., 1903, 16,884.

NAGANA, na-gâ'nâ. A disease of live stock prevalent in South Africa, caused by parasitic Hematozoa, which are carried from a diseased animal to a healthy one by the tsetse fly (q.v.). See **STEPPING SICKNESS**.

NAGANO, nâ-gâ'nô. An inland city of Hondo, Japan, about 95 miles south-southwest of Niigata

(Map: Japan, F 5). It is celebrated principally for the Buddhist temple of Zenkoji, one of the most famous temples in Japan, founded in the latter part of the seventh century. The town is visited by many pilgrims, and carries on a considerable trade in textiles and woven goods. Pop., 1898, 31,319; 1908, 39,242.

NAGAR, nūg'ār. See BEDNUR.

NAGARI, nā'gā-rē. See DEVANAGARI.

NAGĀRJUNA, nā-gar'jū-nā, or **NĀGASENA**, nā'ga-sā'nā. A great Buddhist sage and teacher, the founder of the Mādhyamika school of northern Buddhism, also famous because of his religious conference or discussion with the Græco-Bactrian King Menander or Milinda (q.v.). Among the numerous works attributed to him by tradition is a long commentary on the *Mahāprajñā-pāramitā Sūtra*. Many medical treatises are ascribed to him by Chinese writers, and he is considered the author of several didactic poems. Consult Walliser, *Die mittlere Lehre (Mādhyamika-sūtra), nach der tibetischen Version* (Heidelberg, 1911), La Vallée Poussin, *Mālamadhyamakakārikās (Mādhyamikasūtras) de Nāgārjuna avec la Prasannapadā* (St. Petersburg, 1913), Wenzel, *Journal of the Pali Text Society* (1866).

NAGAS, nā'gaz. The natives of the Naga Hills in southeastern Assam. The Nagas of Manipur and the mountains extending to the north (Patkoi, Barai) of this country seem to be Indonesians, more or less pure, while on the Lushai Hills, south of Manipur, are probably Nagas mixed with Kyens and Burmese of Arakan. The Nagas live in permanent villages, the headmen of which hold their power largely by the exercise of sacerdotal functions. Marriage is exogamous, with paternal relationship. Many interesting taboos and kindred usages are in vogue. The Nagas are best subdivided into the Angami and Kanpui of the west, who wear a petticoat or apron, the Lhota and Hot in the centre, who wear a plaid, and the Nangta, or naked, in the east. Consult W. H. Furness, *The Home Life of the Borneo Head-Hunters* (Philadelphia, 1902), and T. C. Hodsdon, *Naga Tribes of Manipur* (New York, 1911). See **INDO-CHINESE**.

NAGASAKI, nā'ga-sā'kē. The capital of an important prefecture of the same name and one of the principal seaports of Japan, situated on a small peninsula in the northwest of the island of Kiushu, in long 129° 52' E and lat. 32° 44' N. (Map: Japan, A 7). The harbor, about 3 miles long, is one of the safest in the East, and sufficiently deep for vessels of 26 feet draft. The town has water works with filter beds, a meteorological station, schools, a theatre, and hospitals. The principal industrial establishments are the Akunoura Engine Works and several shipyards. The foreign commerce of Nagasaki amounted in 1913 to \$10,399,497, of which \$2,363,318 represented exports. The principal imports are cotton, coal, sugar, and petroleum, and the chief exports coal, rice, flour, camphor, vegetable wax, and tobacco. Nagasaki is an important coaling station. The principal countries of the world are represented by consuls. Pop., 1898, 107,422; 1903, 153,293; 1908, 176,480; 1913, 160,450. Its commercial importance dates from the sixteenth century, when it became the stronghold of the Japanese Christians and an important centre in the foreign trade of Japan. When the Europeans were expelled from Japan the Dutch were permitted to maintain their factory on the islet of

Deshima (q.v.). Nagasaki then became the only point of communication between Japan and Europe. It was opened to foreign commerce by the Treaty of 1858.

NĀGASENA, nā'gā-sā'nā. See NAGĀRJUNA.

NAGCARLÁN, nāg'kār-lan'. A town of central Luzon, Philippines, in the Province of La Laguna, 11 miles south of Laguna. Pop., 1903, 10,212.

NAGEL, nā'gel, ALBRECHT EDUARD (1833-95). A German ophthalmologist. He was born at Danzig, studied first at Königsberg and then at Berlin under Grafe, and, after practicing in his birthplace for several years, became docent (1864) and professor of ophthalmology (1867) at Tübingen. He was also director of the ophthalmic hospital connected with the university. His most important discovery was the identity of the retinas as opposed to the theory of projection. This is explained in his book, *Das Sehen mit zwei Augen* (1861). Nagel's further writings include *Die Refraktions- und Akkommodationsanomalien des Auges* (1866), *Behandlung der Amaurosen und Amblyopien mit Strychnin* (1871), *Die Vorbildung zum medizinischen Studium und die Frage der Schulreform* (1890).

NAGEL, nā'gel, CHARLES (1849-). An American lawyer and cabinet officer, born in Colorado Co., Tex. His father was opposed to secession and removed to St. Louis, where Nagel studied law at Washington University (graduating 1872) and in the offices of Glover and Shepley. After taking a postgraduate course at Berlin he began a successful practice in St. Louis as a member of the firm of Finkelnburg, Nagel, and Kirby. From 1886 to 1906 he was lecturer in the St. Louis Law School. He was elected to the Missouri State Legislature as a Republican in 1881, but was defeated as candidate for councilman in St. Louis in 1891 and for district judge in 1892, although he had been active in party politics. In 1893, however, he was elected president of the council, serving, during a part of his term, as acting mayor, in which capacity he urged economy and reform in the penal and charitable institutions. During the violent street-railway strikes he headed a volunteer committee of 70 which endeavored to effect peace by arbitrating the differences between the strikers and the traction powers. In 1909 he was appointed by President Taft Secretary of Commerce and Labor, a post which he held throughout the administration and one in which his intimate knowledge of labor and transportation problems was serviceable. He advocated the passage of laws granting reciprocity agreements and the arrangement of ship subsidies as an encouragement of American commerce, and was active in initiating at least 64 arbitrations between railroad employers and their laborers and between numerous other corporations and their employees.

NÄGELSBACH, nā'gēls-bach, KARL FRIEDRICH (1806-59). A German classical scholar and professor at Erlangen (1842). He was born near Nuremberg, and was the author of a popular *Latnische Stylistik* (1846, and often reissued); *Die homerische Theologie* (rev. ed., 1861); *Die nachhomerische Theologie* (1857). He edited the *Agamemnon* of *Eschylus* (1863).

NAGLER, nā'glēr, GEORG KASPAR (1801-66). A German writer on art, born at Untersüssbach, Bavaria. After establishing himself at Munich as an antiquary he began the publication of his

Neues allgemeines Künstlerlexikon (22 vols., 1835-52), a monument of industry and careful research. Another important work is *Die Monogrammisten* (vols i-iii, 1857-63, vol iv, ed. by Andresen, 1871, vol. v, ed by Clauss, 1879); besides which he published monographs on Raphael, Dürer, Michelangelo, and Rembrandt, creditable for their day but superseded by more modern works.

NA'GOR (African name). A West African antelope (*Cervicapra redunca*), one of the reed-bucks.

NAGOYA, ná-gō'yá. The capital of the Province of Owari, Japan, in the island of Hondo, 94 miles by rail east-northeast of Kyoto (Map·Japan, E 6). It formerly belonged to the house of Owari, one of the most prominent houses in Japan, whose castle, dating from the beginning of the seventeenth century, is the principal feature of Nagoya and contains many specimens of the work of some of the best artists of Japan. Another interesting feature is the Buddhist temple of Higashi-Hongwanji with beautiful specimens of wood carving. In the vicinity of the town is the industrial settlement of Sedo, where the first glazed pottery in Japan was produced in the thirteenth century and where the first work in cloisonné enameling in the country was done in the nineteenth century. Nagoya is still one of the most important pottery centres in Japan, the industry employing almost its entire population. It has also extensive manufactures of cotton and silk and embroideries. Pop., 1898, 244,145; 1908, 378,231; 1913, 447,951.

NAGPUR, nág-pūr', or **NAGPORE**. A division of the Central Provinces (q.v.), British India, comprising the districts of Nagpur, Bhandara, Chanda, Wardha, and Balaghat. Area, 23,521 square miles. pop., 1901, 2,728,063. 1911, 3,109,838. The surface consists of an alternation of low hills, fertile river valleys, and plains from west to east. Cotton, pulse, rice, maize, oilseed and other seeds, fruits, and vegetables are largely cultivated, and the division is famous for its oranges. The chief minerals are coal, antimony, manganese, ochre, and gold. The Gond (q.v.) inhabit the hilly sections. Nagpur, formerly a part of the great Mahratta kingdom, was ruled by the rajahs of Berar until 1853, when the dynasty became extinct and the territory was annexed by the British. Capital, Nagpur.

NAGPUR, or **NAGPORE**. The capital of the Central Provinces, British India, and of a division and district, 520 miles by rail east-northeast of Bombay (Map. India, D 5). It is situated in an unhealthy place on the banks of the Nag, a small stream, and with its extensive suburb of Sitabaldi, the European quarter, covers an area 7 miles in circumference. This part is centred by the fort-crowned Sitabaldi Hill. Here, also, on the north, are the bazars and the cantonment with Heslop College, Morris College, and the Victoria Technical Institute. Several fine Hindu temples of Mahrattan architecture, handsome gardens, monumental tanks, and the tombs of the Bhonsla Rajahs and a museum are notable native features. Nagpur is the focus of trade and industry in Central India. There are many large cotton mills and compresses. There are manufactures of silk and cutlery, and a considerable trade in agricultural produce, salt, and European manufactured goods. Nagpur is noted for the oranges which it exports.

The city became the capital of an independent Mahratta rajah in 1740. In 1817 it was the scene of an attack by Rajah Appa Sahib with 18,000 troops on the British Residency. The Resident, Mr Jenkins, who had anticipated trouble and had managed to assemble 1350 men under Colonel Scott, defeated the assailants after 18 hours' fighting. A second battle a month later resulted in the Rajah's submission and subsequent deposition. Pop., 1901, 127,734; 1911, 101,415.

NAGUABO, ná-gwá'nó. A city of the Department of Humacao, Porto Rico, situated near the east end of the island, on the highway running from Humacao to Fajardo (Map·Porto Rico, G 3). It is located at the foot of the Luquillo Mountains, a short distance from the coast. The surrounding district produces chiefly sugar cane, grapefruit, and oranges. Pop., 1899, municipal, 10,873, urban, 1812; 1910, municipal, 14,365, urban, 3303.

NAGUILIAN, ná-gé-lé'an. A town of north Luzon, Philippines, in the Province of La Unión, on the Bauang River, 11 miles southeast of San Fernando. Pop., 1903, 11,885.

NAGYBÁNYA, nód'y-bán'yó. A royal free town in the County of Szatmár, Hungary, situated among the Lápos Mountains, 90 miles east of Debreczen (Map·Hungary, H 3). It has a state college, and its chief industries are gold, silver, lead, and copper mining and viticulture, but there are also manufactures of linen and cotton goods and spirits. Pop., 1910 (arrondissement), 30,569.

NAGYBECSKEREK, -béch'ké-rék. A town of Hungary. See BECSKEREK.

NAGYKANIZSA. See KANIZSA, NAGY.

NAGYKÁROLY, -ká'ról-y'. The capital of the County of Szatmár, Hungary, situated 41 miles east-northeast of Debreczen (Map·Hungary, H 3). It has a fine church, a palace of the Counts Károlyi, a Piarist monastery, and Gymnasium. Its chief products are coarse cloth, linen, leather, cutlery, tobacco, and bricks. It became the seat of the Károlyi family in the fourteenth century. Pop., 1910 (arrondissement), 43,692.

NAGYKIKINDA, -ké'kén-dő, or **GROSS KIKINDA**. A town in the County of Torontál, Hungary, situated 36 miles by rail west of Temesvár (Map·Hungary, G 4). It has a higher Gymnasium. The products include flour and meal, and there is an extensive trade in agricultural products and domestic animals. Pop., 1910 (arrondissement), 32,987, about one-half Serbs.

NAGYKÖRÖS, -ké'rësh. A town of Hungary. See KÖRÖS.

NAGYSZEBEN, -sē'bén. A town of Hungary. See HERMANNSTADT.

NAGYSZOMBAT, -sóm'bót. The Hungarian name of Tyrnau (q.v.).

NAGY-VÁRAD, -vá'röd, or **GROSSWARDEIN**, grös'vár-din. The capital of the County of Bihar, Hungary, situated in a beautiful plain on the Sebes Körös (the rapid Körös), 38 miles south-southeast of Debreczen, at the intersection of several railroad lines (Map·Hungary, G 3). It consists of the town proper and several suburbs and has many beautiful dwellings. It was formerly strongly fortified, and its ancient fortress, built on a neck of land between the Körös and Pecze, is still utilized as barracks. Grosswardein is the seat of a Roman Catholic and of a Greek Orthodox bishop. Its notable

ecclesiastical buildings include the large Roman Catholic cathedral, the Greek Catholic and Greek Orthodox cathedrals, the church of St. Ladislav, which contains the remains of the sainted King, and the palace of the Roman Catholic bishop. The theatre and town hall are finely constructed new buildings, and there is an archaeological and art museum. Educational institutions are very numerous, among them being a celebrated school of law, a priests' seminary, a Roman Catholic and a Calvinistic Gymnasium, a commercial school, a girls' high school, and a library of 15,000 volumes. It has flourishing manufactures of pottery, earthenware, oil, vinegar, machinery, bricks, stoves, art objects, spirits, and starch, and the district produces an excellent quality of wine. The sulphur springs of Hajó are situated 6 miles to the south. The city has running water. Pop., 1900, 50,177. 1910, 64,169. Nagy-Várád, one of the oldest cities of Hungary, is said to have been founded by St. Ladislav in 1080, and was destroyed by the Tatars in 1241. It was held by the Turks from 1660 to 1692.

NAHANE. A Déné tribe in the interior of northern British Columbia, composed of the Tahltan, Takutine, and Kaska. Consult A. G. Morice, in *Transactions of the Canadian Institute*, vol. vii (Toronto, 1904).

NAHANT. A town in Essex Co., Mass., on a peninsula extending into Massachusetts Bay, reached by electric cars from Lynn (4 miles) and in summer by steamers from Boston (10 miles) (Map: Massachusetts, F 3). It has a large public library. Nahant has been for years a favorite place of summer resort for Boston people, and has many handsome seaside residences. Pop., 1900, 1182, 1910, 1184. The site of Nahant is said to have been the landfall of the Northmen. It was visited in 1614 by Capt. John Smith, and in 1622 was granted to Capt. Robert Goiges. Until 1853, when it was incorporated as a separate town, Nahant was a part of Lynn. Consult Hurd, *History of Essex County, Massachusetts* (Philadelphia, 1888).

NAHARRO, na-är'rô, BARTOLOMÉ DE TORRES. See TORRES NAHARRO, BARTOLOMÉ DE.

NAHR EL ASI, nâi'êl â'sé. A river of Syria. See ORONTES.

NAHUAN (ná'wân) **STOCK.** An American linguistic stock embracing tribes of high and low culture over a great range of territory. A recent study by Sapir goes far to prove what has long been suspected, viz., that the Shoshonean, Piman, and Nahuatl language stocks should be thrown into a single great stock. This combined stock would be far the most important in the New World, extending from Idaho to Costa Rica and embracing several millions of souls.

Swanton in his linguistic map of Mexico and Central America gives 19 subgroups for his Nahuatl stock (which includes the Piman but not the Shoshonean). The northern tribes seem never to have developed a remarkable culture, although all are in the agriculture, weaving, and pottery-making stage. The Huichol have some interesting customs. In general status they are about halfway between the tribes of central Mexico and the Pueblo Indians of New Mexico and Arizona. They have little god houses which are the most northern examples of the Mexican temple. Concerning the former languages of the states of Zacatecas, Aguascalientes, and San Luis Potosí we have little knowledge except that they belonged to the Nahuatl stock.

The Mexicano, or Nahua proper, is distributed

in many closely related dialects down the west coast of Mexico from Culiacán to Acapulco. From this southern point it spreads eastward over the valley of Mexico and to the southern shores of the Gulf of Campeche. From here on its southern distribution is discontinuous. Areas of Nahuatl speech are found in Guatemala, Salvador, Nicaragua, and Costa Rica. In the valley of Mexico the principal dialects were Aztec and Tlaxcalan. The Guatemala and Salvador tribes were called Pipiles (boys), because their pronunciation was impure. The Niquiran on the shores of Lake Nicaragua gave their name to Nicaragua. The southernmost colony was the Sigua on the Chiriqui lagoon.

The distribution of the Nahuatl languages has an archaeological as well as a linguistic interest. It can be pretty clearly shown that the spread took place after the invention of agriculture and particularly after the cultivation of maize. Now this important food plant is supposed to be developed from a wild plant that grows on the Mexican highlands. It is not unlikely that the spreading Nahuatl tribes were great culture carriers. The earliest horizon of culture in Mexico is called the archaic. It was evidently developed by a people in the agriculture stage. It is found in almost identical form in all the areas in which dialects of the Mexican subgroup of the Nahuatl stock were spoken, from Sinaloa to Costa Rica, and is rare elsewhere. After the primary distribution there were doubtless many shiftings of population, for the Nahuatl tribes developed war, trade, and government to a high plane. For a historical discussion, see the article MEXICAN ARCHAEOLOGY. See also INDIANS, AMERICAN, *Indians of Mexico*.

NAHUATLAN (ná'wâ-tlan) **STOCK.** See NAHUATL STOCK.

NAHUEL HUAPÍ, na-wûl' wa-pé', or **TIGER LAKE.** A lake on the east slope of the Andes in Argentina, on the boundary between the territories of Neuquen and Río Negro (Map: Argentina, E 6). It is 75 miles long, with an average width of 10 miles and an area of 300 square miles. It contains a number of islands covered with luxuriant vegetation, and its banks are fertile and well watered. It receives many streams and discharges into the Atlantic Ocean through the Río Negro. The lake was discovered in 1690 by Jesuit missionaries traveling eastward from Chile.

NA'HUM. The seventh of the minor prophets according to the usual arrangement. Nothing is known of his life except what may be gathered from the notice in the first verse of his prophecy, where he is called the Elkoshite. Where Elkosh was is uncertain. It has been located in Galilee and in Assyria; a third identification is with Beit Jibrin (Eleutheropolis) in the Shep-

helah. Nahum's prophecy consists of two parts, besides the introductory verse: (1) a psalm (i. 2-ii. 2), which describes the majesty of God and His punishment of His enemies in somewhat general terms, and (2) the prophecy proper (ii. 3-iii. 19), which foretells the doom of Nineveh. The style is full of animation and fancy and, at the same time, clear and rounded. The text is in part corrupt. The date of the prophecy cannot be fixed exactly, but must have been later than the capture of Thebes in Egypt (the "No" of iii. 8; see NO-AMON) by Asurbanipal, 663 B.C., and it must have been before the fall of Nineveh, about 606 B.C. Nahum differs from the other preëxilic prophets whose words have come down to us in absence of rebuke of his own people and his attitude of fierce expectation of punishment of the enemy. The investigations of Bickell and Gunkel have established with certainty traces of an original acrostic arrangement in the psalm, and this artificiality points to a late date for this part of the book, it fits in with the conditions existing during the Persian rule in Palestine, when the religious community of Jerusalem was struggling against great odds, and may have been prefixed by an editor to the genuine prophecy of Nahum as an appropriate introduction. If this be the fact, it would be quite in accordance with the free treatment to which older discourses were subjected by post-exilic compilers.

Driver, in *Century Bible* (London, 1906), Haller, in *Die Religion in Geschichte und Gegenwart* (Tübingen, 1913).

NAHUYS VAN BURGST, nā'hois vān boōrgst, HUBERT GERARD, BARON (1782-1858) A Dutch colonial soldier and geographical author, born in Amsterdam. In 1809 he went to Batavia, where he entered the army and fought against the English in Bengal. In 1814 he was appointed Commissioner to the Prince of Java. Nahuys was pensioned in 1830, and nine years afterward returned to Holland, settling at Breda. His writings, which are of no small geographical importance, include *Schets van Benkoelen op de westkust van het eiland Sumatra* (1826) and *Beschouwingen over Nederlandsch-Indië* (1847, 2d ed., 1848).

NAIADS, nā'yādz (Gk. *Naiades*, *Naiades*, *Νηιάδες*, *Nēiades*, from *vān*, *nan*, to flow, connected with Lat. *navis*, Gk. *navis*, *naus*, Skt. *nāu*, ship). In Greek mythology, the nymphs of the springs and hence also of rivers. Caves, especially with trickling water, were sacred to them and were believed to be their dwellings. Owing to the medicinal qualities of some springs, the Naiads naturally appear as healing divinities, and, since divination was associated with the water, they became prophetic. Under their influence the prophet became inspired or even mad. See also NYMPH.

NAIANT, nā'ānt, or **NATANT**, nā'tānt (OF., swimming). An heraldic term applied to a fish when borne horizontally across the shield, in a swimming position. See HERALDRY.

NAIDU, nī'dōō, SAROJINI (1879-). A Hindu author and reformer. She was born in Hyderabad, the daughter of Dr. Aghorenath Chattopadhyay, an educator, of Bengali Brahmin stock, who had studied at Edinburgh and Bonn. In 1883 she married Dr. Naidu, principal medical officer in the service of the Nizam. She had been educated in England (1895-98)—at King's College, London, and at Girton, Cambridge. King Edward VIII gave her the gold Kaiser-i-Hind for organizing flood-relief work in Hyderabad in 1908. She lectured throughout India on social and religious questions and published two volumes of English verse, *The Golden Threshold* (1905), preface by Arthur Symonds, and *The Bird of Time* (1912), preface by Edmund Gosse, which were translated into many of the Indian vernaculars.

NAIL (AS. *nægel*, OHG. *nagal*, Ger. *Nagel*, nail, Goth. *ga-nagljan*, to nail; connected with OChurch Slav. *noqŭti*, Lith. *nagas*, Skt. *nakha*, nail). The terms "nail," "claw," and "hoof" are popular names for different developments of the same epidermal formation. All are horny secretions formed from the outer layer of the skin, primarily to protect the tip of the digits in the higher vertebrates. Nails have retained this function, while claws have become specialized as weapons of offense or defense, and hoofs are specialized to protect the whole of the terminal joint of the digit. Hoofs are usually thick, heavy, and blunt, and are best developed where the number of digits is reduced; they are characteristic of the great group of herbivorous animals known as Ungulata, and reach their highest development in the horse. Nails are flattened, usually thin, and more or less rounded at the end. They are present in some reptiles, in certain birds (as the grebes), and in many mammals, especially the monkeys and man. Cf. HORN.

Human Nails. These are the elastic, horny plates placed as protective coverings on the dorsal surface of the terminal phalanges of the fingers and toes. Each nail consists of a root, or part concealed within a fold of skin, a body, or exposed part attached to the surface of the skin, and a free anterior extremity called the edge. The skin below the root and body of the nail is termed the matrix, from its being the part from which the nail is produced. This is thick and covered with highly vascular papillae, and its color is seen through the transparent horny tissue. Near the root the papillae are smaller and less vascular, hence the portion of nail corresponding to this part is of a whiter color; from its form, this portion is termed the lunula. The chemical composition of the nails is given in the article HORN. According to the observation of Beau, the finger nails grow at the rate of about one-thirtieth of an inch in a week, while the toe nails grow with only about one-fourth of that rapidity. The general state of health influences the growth of nails, and after illness a deficient formation of horny matter may result, shown by the production of a groove across the nail. The breadth and position of this groove indicate roughly the period and duration of the illness. An inflammation of the matrix of the nail is called *onychia*. The affection is apt to be syphilitic in origin. The nail rots and crumbles away at the root; the free edges crack and split; and there are pain, redness, and swelling of the soft tissues. An acute inflammation of the tissues about the nail is termed *paronychia* or *whitlow*. When a nail has

been removed by violence, or has been thrown off in consequence of the formation of matter (pus) beneath it, a new nail is speedily formed, provided the matrix has not been seriously injured.

There is a very common and troublesome affection popularly known as *ingrowing nail*. Its most usual seat is the great toe. It does not in reality arise from any alteration of the nail, but from the adjacent soft parts being constantly pressed against its edge by the use of tight shoes. These parts become swollen and inflamed, supuration ensues, and an intensely sensitive ulcer is formed, in which the nail is embedded. In obstinate cases it is not infrequently necessary to remove a portion of the nail, an operation which may be done under local anæsthesia without pain. *Subungual eczema* consists of an overgrowth of bone on the distal phalanx, generally of the great toe, forming a painful swelling, the only cure for which is surgical.

The appearance of the nails is of considerable import in diagnosis. The nails of gouty persons are hard, brittle, and longitudinally striated. Great hypertrophy of the nails, with changes in their structure, is occasionally seen and is termed *megalonychia*. Its cause is not known. Irregular development, fragility, dryness, and cracking of the nails are observed in syphilis, as a result of trophic changes after nerve injuries and diseases, in Raynaud's disease and in scleroderma. Growth is sometimes arrested in hemiplegia and acute infantile spinal paralysis. In victims of the chloral habit ecchymoses and ulcers may sometimes be seen at the base of the nail.

NAILS. Slender pieces of metal, tapering towards and sometimes pointed at one end and with flattened or rounded heads. Nails are made of many different materials, as copper, zinc, brass, iron, or steel, but the bulk of the nails in ordinary use are made of steel wire. Iron nails, in turn, may be either wrought, cut, or cast, or made from wire.

Until almost the close of the eighteenth century all nails were hand-made. In France for nearly a century light nails for carpenter work have been made of wire, but until 1850 they were made by hand with a hammer. The hand-made nail was pinched in a vise, with a portion projecting. A few blows of a hammer flattened one end into a head. The head was beaten into a counter sunk in the vise, thus regulating its size and shape. In northern Europe, Britain, and America nails were made, at first, by forging on an anvil. The iron used for hand nail making was first formed into nail rods, which were sold in bundles. The nail rods were prepared either by rolling the malleable iron into small bars of the required thickness or by the much more common practice of cutting plate iron into strips by means of rolling shears. In Colonial days the making of nails from these rods was a household industry among the New England farmers.

To America belongs the distinction of having first made cut nails by machinery, and with the advent of machine-cut nails the household industry of nail making rapidly declined. Of these early inventions the only one that has survived is that patented in 1786 by Ezekiel Reed, of Bridgewater, Mass. At the close of the eighteenth century 23 patents for nail machines, or improvements thereto, had been granted in the United States, and their use had been generally introduced into England, where they were re-

ceived with enthusiasm. In 1883 cut nails were first made of steel.

The manufacture of tacks was also a household industry in New England till well into the nineteenth century. The wire was pointed on a small anvil; it was then placed in a vise, worked by the foot, which clutched it between jaws furnished with a gauge to regulate the length. A certain portion was left projecting, which was beaten by a hammer into a flat head. New England, and particularly the city of Taunton, Mass., is now the centre of the tack-making industry in the United States.

Wire nails were first made in the United States by William Hensel, of New York, in 1851 or 1852. In 1875 Father Goebel, a Catholic priest, went to Covington, Ky., from Germany, where the art of making wire nails was practiced. Goebel began the manufacture of wire nails at Covington, and in 1876 the American Wire and Screw Nail Company was established under his leadership. At first the nails were made by hand, but soon a French machine was imported. In this machine the nails were held in dies to form the head. The blow of the hammer which produced the head was caused by a board or single leaf spring suspended from a ceiling, against which the machine, in rotating, pushed a cam. The release of the latter produced the blow.

For a time the wire nails were made with barbs, that they might hold more securely, and the new industry grew but slowly. In 1876, at the Centennial Exhibition, the company received a silver medal over French and German competitors. This called the attention of the trade to the article, and two other firms at once took up its manufacture. By 1885 there were 26 firms in the business, and the wire nail had been adopted by many manufacturers. Since then their use has rapidly increased.

Two types of wire-nail machines are described in Smith's *Treatise on Wire*. (See *Bibliography* at end of article.) In one type "the wire is automatically straightened from the coil and fed into the machine, where dies grip it, while a pair of nippers cuts the wire off in suitable lengths, when it is automatically pointed and headed. The latter operation is effected by means of the spring-bolt mechanism operated by a cam of the main shaft and remaining inoperative until a sufficient length of wire has been fed to the machine for the next nail. The cutting and pointing are performed in one operation." In the second type the heads are formed by steady pressure instead of intermittent striking.

The older process of making cut nails is, in general, as follows: the ore, whether hematite or magnetic, is smelted in a blast furnace, run into pigs, puddled, squeezed, and, if need be, hammered, rolled in the puddling-ball train, and cut to lengths. These are then fagoted (i.e., piled so as to break joints), reheated to a white heat, drawn, passed through the nail-plate train, and the sheets, of the required width and thickness, allowed to cool. It is next cut across its length (the width of the sheet being usually about a foot) into strips which are a little wider than the length of the required nail. These plates, heated by being set on edge on hot coals, are seized in a clamp and fed to the machine, end first. The pieces cut out are alternate, and slightly tapering, of course, with the fibre, and are squeezed and headed up by the machine before going into the trough.

In 1897 the wire nails produced in the United States amounted to 8,997,245 kegs of 100 pounds each and in 1909 to 13,926,861 kegs. The output of cut nails for the same year was 2,106,799 kegs and, in 1909, 1,009,319 kegs. American wire nails are largely exported to Europe and to other parts of the world.

The accompanying table shows the export of nails from the United States from 1896 to 1914.

NAILS EXPORTED FROM THE UNITED STATES

(From the Statistical Abstract for 1914, prepared by the Bureau of Foreign and Domestic Commerce, under the direction of the Secretary of Commerce and Labor)

FISCAL YEAR	Cut		Wire	
	Pounds	Value	Pounds	Value
1896	20,730,260	\$428,630		
1897	26,476,585	519,471		
1898	32,310,399	612,234		
1899	32,869,265	604,215	22,894,099	\$458,787
1900	24,915,866	647,711	51,193,212	973,434
1901	25,953,322	575,285	84,635,468	2,124,528
1902	15,206,626	318,539	44,612,619	982,313
1903	16,129,446	347,607	46,416,697	947,242
1904	21,448,899	445,033	62,997,105	1,245,946
1905	20,386,670	404,400	72,646,550	1,517,876
1906	15,427,539	314,485	82,558,131	1,793,230
1907	17,630,335	371,673	99,842,011	2,095,488
1908	14,517,462	335,271	89,494,612	2,098,465
1909	17,950,795	396,262	79,612,680	1,983,465
1910	19,949,278	407,904	59,995,196	1,299,086
1911	22,853,944	434,788	81,531,280	1,705,026
1912	27,669,712	472,217	112,094,392	2,364,271
1913	10,764,208	203,272	140,931,548	2,865,980
1914	10,130,030	191,389	122,139,208	2,541,250
			80,310,081	1,693,132

Consult: Smith, *Treatise on Wire, its Manufacture and Uses* (London and New York, 1891); Swank, *History and Manufacture of Iron in All Ages* (Philadelphia, 1892); "Steel Wire and Nail Making," in *Scientific American*, vol. lxxxix (New York, 1903).

NAIN (Gk *Nalv*) A town in Galilee, mentioned once in the New Testament (Luke vii 11-17), as the scene of Jesus' raising of a widow's son from death. It lay on the northern slope of the Jabel ed Daḥi, popularly known as Little Hermon, and was some 6 miles southeast of Nazareth and some 2 miles southwest of Endor (Map. Palestine, C 2). Its distance from Capernaum, some 20 miles, places it well within the limits of Jesus' second preaching tour, which must have included a more distant circle of towns than the suburban villages of Capernaum visited on the first tour (Mark i 38). This journey is referred to in Luke viii. 1-3, and is most likely to have included this incident, though it is mentioned in the previous chapter. The site is now occupied by a small and squalid village of mud huts, the modern name of which is *Naim*. Ruins stretching to the north show the place to have been at one time of some importance. Their relatively modern character, however, gives us no evidence as to the size of the place in Jesus' time, while the varied use of *πόλις* (city) in the Gospels indicates nothing definite as to its character. In these ruins there is no trace of city walls (against Tristram, *Land of Israel*, p. 125); so that the gate referred to in the Gospel incident is in all probability merely the ordinary entrance of the road into the town. (Consult Conder, *Tent Work*, p. 63.) The rock tombs to the west are of undoubted antiquity. A little sanctuary, called "The Place of our Lord Jesus," marks the site of an early chapel, erected doubtless to commemorate the incident referred to by

Luke. The situation of the village, though only some 700 feet above the sea, commands an interesting view of the plain of Esdraelon, with Mount Carmel to the southwest, Mount Tabor to the west, and Mount Hermon to the northeast. Sir W. M. Ramsay (*Education of Christ*, preface, p. ix, New York, 1911) believes the ancient town to have stood on the top of the hill, though he offers no proof of his view.

NAIN DE TILLEMONT, SÉBASTIEN LE. See TILLEMONT, S. LE N. DE

NAIN SING (?-1882). A Hindu explorer in Central Asia, born at Namaon. He was trained by a Colonel Montgomerie for exploring work and in 1856 and 1857 was employed in Kashmir and Ladak by the Schlagintweits. His journey to Lhasa (1865-66) was rewarded by the Royal Geographical Society. In 1867 he explored the gold mines of Thok Jalung, and he went with Sir Douglas Forsyth to Yarkand in 1873. His most important journey was from Leh across the unexplored plateau of Tibet in 1874-75, marking its many lakes, to Lhasa, and thence to Calcutta. For a description, with map, of this expedition, consult the *Geographical Magazine* (London, 1876).

NAIPALI (nāi-pā'lē) **LANGUAGE**. The Indian language spoken in Nepal. This dialect approaches in general structure more closely to Hindi than to any other of the modern Indian vernaculars. Thus, as examples showing the affinity of Naipali to the New Indian dialects, may be cited Naipali *pāk* (ripe), Bengali *pākā*, Hindi *pakkā*, Sindhi *pakō* (Skt *pakva*), Naipali *mahaingō* (costly), Hindi *mahaingā* (Skt *mahārgha*), Naipali *dhilō* (loose), Hindi *dhilā* (Skt. *śīthla*), Naipali *dūt* (milk), Hindi *dudh*, Panjabi *dudd* (Skt *dugdha*). In inflection also there are parallels, as Naipali *gar chum* (I do), Gujarati *karum chum*. Distinctive marks of Naipali are the occasional aspiration of medial consonants (e.g., *aghi*, 'before,' Hindi *agē*, Prakrit *aggē*, Skt *agrē*), softening of initial surds (e.g., Naipali *garanu*, 'to make,' Hindu *karnā*, Skt *kar*), and the use of an agential case as the active subject of a passive voice (a curious phenomenon widespread in the modern Indo-Iranian languages) in *-le* corresponding to the Hindi *-nē* (e.g., Naipali *dūtlē*, '[by the] milk,' Hindi *dudhnē*). The language has a number, possibly one-fifth, of loan words from its Tibeto-Burman neighbors, but has maintained itself on the whole with considerable purity. It has a very scanty literature written in the Devanagari character.

Consult: A. F. R. Hoernle, *Comparative Grammar of the Gaudian Languages* (London, 1880); Dravid, *English Guide for the Use of Nepali Students* (Benares, 1901); L. H. Gray, *Indo-Iranian Phonology* (New York, 1902); Turnbull, *Nepali Grammar, and English-Nepali and Nepali-English Vocabulary* (Darjeeling, 1904); Sylvain Lévi, *Le Népal, étude historique d'un royaume hindou* (3 vols., Paris, 1905-08).

NAIRN, nārn. The capital of Nairnshire, Scotland, a royal municipal and police burgh, 15 miles northeast of Inverness, at the mouth of the river Nairn (Map. Scotland, E 2). It is noted for the excellence of its sea bathing and artificial baths. It manufactures rope and twine and has salmon fisheries and quarries near by. Pop., 1901, 5089; 1911, 5906.

NAIRNE, nārn, CAROLINA (OLIPHANT), BARONESS (1766-1845). A Scottish song writer, born at Gask, Perthshire. In 1806 she married

her second cousin, Major William Murray Nairne (afterward sixth Lord Nairne); lived in Edinburgh till her husband's death (1829), afterward in Ireland and on the Continent; and returned to Gask, where she died. Between 1821 and 1824 she contributed songs to the *Scottish Minstrel* of R. A. Smith. As a song writer she is highly esteemed. Particularly beautiful are "Land o' the Leal," "Caller Herrin'," "The Laird o' Cockpen," and "The Auld House." Appearing anonymously in her lifetime, her poems were posthumously collected in *Lays from Strathearn* (1846). Consult Rogers, *Life and Songs of Lady Nairne* (Edinburgh, 1869), and Kingdon Oliphant, *Jacobite Lairds* (Grampian Club, 1870).

NAIRNSHIRE. A county in the northeast division of Scotland, bounded by the Moray Firth and the counties of Inverness and Elgin (Map: Scotland, E 2). Area, 163 square miles, of which about 26,000 acres are under cultivation. There is considerable agricultural activity on the low fertile soil near the coast, but the land rises into low mountainous regions in the south. The county is known for its cattle breeding, and there are also profitable granite quarries and fisheries. Capital, Nairn. Pop., 1901, 9291, 1911, 9319.

NAIROBI, nī-rō'bē. The capital of British East Africa and of the Province of Ukamba, 327 miles northwest of Mombasa by rail (Map: Africa, H 5). It lies on the Athie Plains, some 5500 feet above sea level, at the foot of the Kikuyu Hills, and is the headquarters of the government of the Protectorate and of the Uganda Railway. The government buildings are situated at the foot of the hills, and beyond them lies a thriving town, with extensive railroad works, government and Roman Catholic schools, excellent hotels, stores, athletic grounds, and a race course. The public buildings include the town hall, the general hospital, the theatre, and Anglican, Roman Catholic, Moslem, and Hindu places of worship. The commercial life of a large East Indian population centres in the picturesque bazar, which runs at right angles from the main street of the town. The official residents are found dwelling upon the hill overlooking the government buildings, and beyond its brow is the cantonment of the King's African Rifles. The civilian inhabitants prefer the suburb of Parklands, situated on the plain about a mile and a half from the town. Pop., 1914, about 30,000, of whom some 1200 are Europeans, 3500 East Indians, and the rest natives of various tribes. In the immediate vicinity are some 400 European farmers, and the town is visited annually by large numbers of sportsmen from all parts of the world, attracted by the big-game shooting for which the Protectorate is famous.

NAIRS, nā'ērz, or NAYARS. The landholder class of Malabar, in southwestern Hindustan. Originally the military dominant class, they have assimilated some of the indigenous populations and now form a conglomerate of different castes and tribes; they nevertheless, in many cases, contrast sharply with the Dravidians by their fine type, their light complexion, and their thin and prominent nose. They number over 1,000,000 and are divided into a northern and a southern community, which keep apart from each other. They seem to have some linguistic and somatological affinities with the Indo-Aryans. They are probably a mixed race

of Aryans and Malayalas. By all writers they are described as a tall people, gracious in manner. Many of the women are quite pretty. The history of the Nairs begins with the invasion of the ancient Hindus and the establishment of a Brahman aristocracy—a conflict between these privileged classes and the democratic masses ended in victory for the latter and laid the foundations of the prosperity of the Nairs in the thirteenth century. Islam of a sort is in vogue, together with the older Hinduism. Through all these changes the peculiar marriage system, which has made the Nairs of special interest to ethnologists, has not been wholly obliterated. This system, often called the Nair family, is polyandry (often adelphic) with matriarchal joint family. It has now fallen into disuse, but succession is still traced through females, a man's sister's children being his nearest heirs. Consult E. S. Schmidt, "Die Nairs," in *Globus*, vol. lxviii (Brunswick, 1895), and Fawcett, "Nayars of Malabar," in *Bulletin of the Madras Government Museum*, vol. iii (Madras, 1901).

NAISSANT, nā'sānt (Fr., being born). A term applied in heraldic blazon to an animal depicted as coming forth out of the middle—not, like *issuant*, out of the boundary line—of an ordinary. See **HERALDRY**.

NAIVASH'A. A town in British East Africa, capital of Naivasha Province, 391 miles by rail northwest of Mombasa (Map: Congo, C 3). It stands, some 6230 feet above sea level, on the shores of Lake Naivasha, a picturesque circular body of water, about 13 miles in diameter, which is a famous haunt of hippopotami. The town is the centre of a rapidly progressing district where European farmers are conducting sheep running and wheat growing on an extensive scale. In the neighboring Rift valley there are prosperous ostrich farms, and a considerable volume of maize is raised for export.

NA'JA (from Hind *nāg*, Skt *nāga*, snake). A genus of elapine venomous serpents of the tropical parts of the Old World, which includes the cobras. The typical species is the common hooded cobra (*Naja haje*) of Africa, called asp in the north and spy slange or spitting snake among the Dutch of South Africa. Other species are the cobra di capello and hamadryad. See **COBRA**; **HAMADRYAD**; **PROTEROGLYPHIA**, and **Plate of FOREIGN VENOMOUS SERPENTS** with the article **SNAKE**.

NAJAC, nā'zhák', EMILE, COUNT DE (1828-89). A French dramatic author, born at Lorient (Morbihan). Except for a short time spent in a government position, he gave himself entirely to the writing of farces, texts for operas, and vaudevilles, sometimes in collaboration and sometimes alone. Among these are. *Un mari en 150* (1853); *La fille de trente ans* (1859), with Scribe. *Le capitaine Butterlin* (1860), with About; *Un mariage de Paris* (1861), with About; *Nos gens* (1866), with About; *Bébé* (1877), with Hennequin, *Nounou* (1879), with Hennequin; *Divorçons* (1886), with Sardou; *Le fiancé 117* (1886), with Millaud.

NAKAMURA MASANAO, nā'ká-mō'rā mǎ'sá-nā'ō (1825-?). A Japanese scholar, born in Yeddo. He went to England in 1866 and remained there for two years, returning home on the outbreak of the revolution. Thenceforth until his death he labored perseveringly in the interest of modern education. His schools and translations exerted wide influence, and his serv-

ices were recognized by posthumous honors conferred by the Emperor.

NAKANE, ná'kú'ná. The name of two leading Japanese mathematicians, father and son. The elder, Nakane Genkei (1661-1733), was born in the Province of Omi and studied under Takebe (q.v.). In early years he was a physician in Kyoto. He was particularly well known in the field of astronomy. His son was Nakane Genjun (1701-61), whose *Kaihō Yenshu-putsu* (1729) contained a new method of solving numerical higher equations. Consult Smith and Mikami, *History of Japanese Mathematics* (Chicago, 1914).

NAKED BAT. A large Malayan, long-tailed, emballonurine bat (*Chromomes torquatus*), remarkable in having the skin entirely hairless except for a fringe of hairs about the neck. It has a projecting, piglike snout and a thick tail. It inhabits the forests of Java, Sumatra, and Borneo, where it appears only at night. Its most curious feature is the presence of a pouch or pocket of skin on each side of the body under the arms, which is present in both sexes and contains the mammae. In this pouch the young are carried while suckling. Consult Hensfield, *Zoological Researches in Java* (London, 1828), and Dobson, *Catalogue of Chevroptera in the British Museum* (ib., 1878). See Plate of BATS.

NAKHITCHEVAN, ná'ké-chē-van'. A former town in the Government of Ekaterinoslav, Russia, situated on a hill on the right bank of the Don, 2½ miles from Rostov-on-the-Don, with which it is now incorporated (Map. Russia, E 5). It has manufactures of silk, woolen, and silver goods and has a considerable trade in jewelry and precious stones with Constantinople, Turkestan, Circassia, and Astrakhan. The town was founded by Armenians from the Crimea in 1779 and is the see of the Russian Greek-Armenian Patriarch. Pop., 1897, 29,312, 1910, 71,000 mostly Armenians.

NAKONG, ná-kōng' (African name). One of the horned antelopes of south Central and East Africa, called also Speke's antelope, sitatunga, and *Tragelaphus spekei*. It is peculiar for its perfectly uniform grayish color when mature. It formerly gathered in herds and was one of the most highly prized of the smaller species. See Plate of GAZELLES AND SMALL ANTELOPES.

NAKSHATRA, nák-shā'trā (Skt. *nakṣatra*, star, luminary, of doubtful etymology). A Sanskrit term used in the Vedic period in the sense of star. At a later time it was applied to the asterisms lying in the moon's path or to the mansions in which the moon was supposed to rest in its path. The number of these asterisms was reckoned originally at 27, later at 28, and mythology transformed them into the daughters of Dakṣha, who became the wives of the moon. Consult Thibaut, "Astronomie, Astrologie, und Mathematik," in Buhler, *Grundriss der indoarischen Philologie* (Strassburg, 1899).

NAKSKOV, ná'kskōv. A town of Denmark, situated on Nakskov Fjord, on the west coast of the island of Lolland (Map: Denmark, E 4). It is the terminus of the Lolland Railroad, has the largest sugar refinery in the country, with other factories, and has a harbor with considerable shipping and an active trade in grain. Pop., 1901, 8317; 1911, 9480.

NALA, ná'lā. A legendary king of ancient India whose domain was Nishadha, apparently a district between the modern Oudh and Berar. The story of his marriage with Damayanti, the

daughter of King Bhima of Vidarbha (modern Berar), together with the events which followed in consequence of his passion for gambling, the loss of his kingdom, his desertion of wife and children, the final reunion with them, and the restoration of his fortunes, forms one of the most romantic episodes of the Mahabharata (q.v.). This episode, entitled the *Nalopakhyaṇam* (Story of Nala), has often been separately edited and translated as an edition of the Sanskrit text, together with Dean Milman's translation (1835), by Monier-Williams (Oxford, 1860, 1876): a versified rendering by Sir Edwin Arnold, *Indran Idylls* (Boston, 1883); a translation into German prose by Kellner, *Nala und Damayanti* (Leipzig, 1886), besides several others by Kosegarten (Jena, 1820), Ruskert (Frankfort, 1828), Bopp (Berlin, 1838), Meier (Stuttgart, 1847), and Holtzmann (Karlsruhe, 1847; Stuttgart, 1854). There are, furthermore, translations into Latin by Bopp (3d ed., 1868), into Swedish by Edgren, into French by Aignan (1823) and by Burnouf, and into Italian by St. Gatti. The poem is marked by a high tone of morality, shown in the rare fidelity of Damayanti, as well as by tender pathos. Among the many ancient traits with which it is replete is the simplicity of the manners of its leading characters—the Prince, e.g., prepares his own food.

The subject of Nala's career was a favorite theme with the Hindus. One of these, the Sanskrit *Nalodaya* (Rise of Nala), describes in four cantos the restoration of Nala's fortunes. This artificial poem is ascribed to Kalidasa, but it probably belongs to a much later age. It is a remarkable specimen of the so-called Kavya style of artificial composition, abounding in elaborate metrical devices, alliterative versification, intricate rhythms, complicated constructions, and pedantic imagery. It has been edited by Benay (Berlin, 1830), by Yates (Calcutta, 1844), and by Vidyasagara (ib., 1873). An excellent German translation, imitating the artificial devices of the original, was made by Von Schack, *Stimmen vom Ganges* (2d ed., Stuttgart, 1877).

To the same Nala cycle belongs the *Nāshadhiya*, or *Nāshadha-Carata* (Adventures of Nala of Nishadha), written in 22 cantos by one Sri-Harsha, who belongs to the latter half of the twelfth century of our era. An edition of this, with the Sanskrit commentary of Narayana, was published by Roer (Calcutta, 1855) and by Swadatta (Bombay, 1894). Consult Lobedan, *König Nal und sein Weib* (Leipzig, 1863), and A. A. Macdonell, *History of Sanskrit Literature* (London, 1913).

NAMANGAN, ná'mān-gān'. A district town in the Territory of Ferghana, Russian Turkestan. It is situated in the elevated valley of the Syr Darya and on the canal of Yangi (fed by the Naryn), about 45 miles northwest of New Margelan, the capital of the territory (Map: Asia, Central, O 2). The chief occupations are cotton ginning and the manufacturing of soap, leather, etc. The trade in cotton, fruit, and animal products is important. Pop., 1908, 73,279, including only a few Russians.

NAMAQUALAND, ná-mā'kwā-lānd, LITTLE. A region of the Cape Province, South Africa, bordering on German Southwest Africa (Map: Cape of Good Hope, C, D 7). It is a portion of the Cape Province proper, while Great Namaqualand is the south extremity of former German

Southwest Africa. The majority of its inhabitants are Hottentots, numbering about 23,000. It is important on account of its copper deposits. The chief town is Port Nolloth on the coast.

NAMATIANUS, CLAUDIUS RUTILIUS. See RUTILIUS NAMATIANUS, (CLAUDIUS).

NAMAYCUSH, nām'ā-kūsh (North American Indian name). The lake or Mackinaw trout (*Christivomer namaycush*), the largest of the Salmonidæ. It is closely related to the chars, from which it differs slightly in the character of the vomerine teeth. It is a very good food fish and is the second in commercial importance of the fish of the Great Lakes. Extreme weights of 125 pounds have been reported, but the average is from 15 to 20 pounds. Its food is fishes and a great variety of other things. The spawning season is during September and November. The namaycush occurs in the Great Lakes and in the inland lakes of New York and northern New England, where the local names "longe" and "togue" are applied to it. It is also found in the headwaters of the Fraser and Columbia rivers and the streams of Vancouver Island. A deep-water variety, called siscowet (q.v.), is found in Lake Superior. Its flesh is fatter and less desirable as food. See SALMON; TROUT, and consult authorities there cited. See also FISHERIES, and Plate of TROUT AND GRAYING.

NAMDEV. See MARATHI.

NAM DINH, nam dēn'y'. A city of Tonkin, French Indo-China, situated 40 miles southeast of Hanoi, on the Tonkin River, 30 miles from the sea (Map French Indo-China, E 2). It lies in the most fertile region of the delta and is prosperous and well built, with broad, paved streets. It is the seat of a French Resident and the intellectual centre of Tonkin. It is almost as important commercially as Hanoi, has numerous well-stocked shops, regular boat service on the river, and a brisk trade in rice, silk, cotton, and indigo. It has a cotton mill with 25,000 spindles. Pop., about 40,000.

NAME (AS. *nama*, Goth. *namō*, OHG. *namo*, Ger. *Name*; connected with Lat. *nomen*, Gk. *ὄνομα*, *onoma*, Ir. *ainm*, OPruss. *emnes*, OChurch Slav. *ime*, name, and with Lat. *gnoscere*, Gk. *γινώσκειν*, *gignōskein*, Skt. *jñā*, Ger. *kennen*, Eng. *know*). In law, a word or words employed to designate a person, place, or thing. In early times in England the first, or Christian, name of a person was the only one recognized by the law, and surnames were mere words of description to identify one person from another having the same Christian name. This practice was confirmed and received legal sanction by a statute (1 Hen V, c. 8), called the Statute of Additions, which provided that not only the name of an individual should be inserted in a writ or indictment, but his estate or degree, his calling or business, and the town or district in which he resided. By reason of the above custom and the statute many persons who had not otherwise adopted surnames were known by the name of their calling, place of residence, or by some other characteristic. Thus, George, the smith, became George Smith, and John of Wessyngton became John Wessyngton.

In law, the middle name or initial of a person is generally regarded as of no importance and not a part of his legal name. Therefore the omission of it in a legal instrument or in legal proceedings is not considered an error, except in a few jurisdictions. In general a person's Chris-

tian name should be written out, and in some States the mere initial of the Christian name, together with the surname, has been held insufficient under statutes requiring the names of persons to be subscribed to certain instruments.

Owing to the almost infinite variety of surnames and the consequent difficulty in spelling them properly, the courts have adopted a rule known as the rule of *idem sonans* (the same sound), by which they determine whether or not an incorrect spelling of a name is a fatal error in legal documents. This rule provides that where a name is not correctly spelled, if it sounds identically like the name intended to be written, it will be held sufficient, the error in spelling being disregarded. Thus, the surnames Preyer, Prior, and Pryor have been held to be *idem sonans*. This rule is followed as to legal instruments and transactions generally, but where a name in an instrument varies in some irregular manner from the common method of spelling a name identically the same in pronunciation, the necessity for departing under certain circumstances from the doctrine of *idem sonans* is apparent, as in the case of such as Jaeger and Yaeger, which may be pronounced so as to sound alike, and a person searching against the name of Jaeger would naturally not find the record of the conveyance, under Yaeger, and accordingly the courts may hold that the public is not bound by constructive notice in such a case.

Legally a person is under no obligation to bear the surname of his parents nor the Christian name conferred upon him in infancy, and he may, therefore, change his name at will, subject only to the possible inconvenience of proving his identity if it should be called in question. To obviate this difficulty it is usual for a person desiring to change his name, in whole or in part, to make application to some court or judge to authorize the change. The order of the court in such case, being matter of public record, furnishes the means for identification when required. The matter of change of name is in many States regulated by statute, and the application for such change is usually granted as a matter of course, unless it appears that it might result in hindering or defrauding creditors of the applicant.

There are statutory provisions in some jurisdictions requiring the registration of fictitious trade names, where persons adopt them and do not do business under their correct names. Corporations are usually required to adopt names which are not identical with those of other corporations in the same State. At common law there is no property right in a name, but the United States statutes provide for protection in the use of trade names to a certain extent, and courts of equity will sometimes interfere to enjoin the wrongful use of the business name of another, to prevent fraud. See COGNOMEN; MISNOMER; TITLE; TRADE NAME. TRADE-MARK.

NAME OF JESUS, LITANY OF THE. See LITANY.

NAM'PA. A city in Canyon Co., Idaho, 22 miles west of Boise, the State capital, and on the Oregon Short Line and the Idaho Traction railroads (Map Idaho, B 6). It contains a State sanitarium and a Carnegie library. Gold and silver mines and large bodies of pine timber are tributary to the city, but its chief interests are in live stock, grain, dairying, and fruit growing. It lies in the district of the

large Boise irrigation project. Nampa owns its water works. Pop, 1900, 799; 1910, 4205

NAMUR, na'mur'. A province of Belgium, bounded on the north by Brabant and Liège, on the east by the Province of Luxemburg, on the south by France, and on the west by Hainault (Map: Belgium, C 4). Area, 1413 square miles. The province is traversed through the centre by the Meuse River. Its surface is partly level, partly hilly, and in part densely forested. The soil is very fertile, and agriculture is the chief occupation, though a large proportion of the population is engaged in mining and allied industries. About 750,000 tons of coal are mined yearly, and the province is rich in iron, lead, sulphur, alum, and marble. Pop, 1910, 362,846. Namur appears as a county in the tenth century and came successively under the counts of Hainault and Flanders and the dukes of Burgundy, finally constituting one of the 17 provinces of the Netherlands. It was occupied by the Germans during the European War which broke out in 1914

NAMUR. The capital of the Province of Namur Belgium, at the confluence of the Sambre and Meuse, 35 miles southeast of Brussels (Map: Belgium, C 4). Two bridges across the Meuse connect it with the extensive suburb of Jambes, and several bridges span the Sambre to the suburb of Salzinnes. An extensive circle of nine detached forts has revived its former military importance, and there are large cavalry barracks in the town. Among many fine churches is the Renaissance cathedral of St. Aubin, built in 1751-67 and noted for the beauty of its statues, carvings, and paintings. The Archaeological Museum has a valuable collection of Roman and Frankish antiquities and a library of 20,000 volumes. An art gallery is attached to the Hôtel de Ville. The old citadel near by has been leveled, and the grounds laid out in a recreation park. Namur is an important industrial centre, with iron and brass foundries, and is known for its manufactures of cutlery, machinery, chicory, glass, leather, and bronze art objects. Near by are iron and coal mines, and a good river trade moves down the Meuse. The city was taken by the forces of Louis XIV in 1692, and three years later was besieged and captured by William III. It was taken by the French in 1746 and restored to Austria in 1748. For a third time it fell into the hands of the French in 1792. It was captured by the Germans after a stubborn resistance during the European War which began in 1914. (See WAR IN EUROPE.) Pop, 1900, 32,333; 1910, 31,273

NANA, ná'ná'. One of the Rougon-Macquart series of novels by Emile Zola (1880).

NANAIMO, na-ní'mó. A city, port of entry, and the capital of the Nanaimo electoral district, British Columbia, Canada, on Departure Bay, on the east coast of Vancouver Island, and on the Esquimalt and Nanaimo Railway, about 73 miles northwest of Victoria (Map: British Columbia, D 5). It is opposite Vancouver City on the mainland, with which it has daily steamboat communication; has a safe and commodious harbor, and is a centre of the coal-mining and herring industries of British Columbia, its coal fields having an area of 200 square miles. It has county buildings, a customhouse, and a Roman Catholic convent. It also has large lumber mills and manufactories of bricks, beer, aerated water, foundry and machine-shop prod-

ucts, explosives, sashes and doors. Copper and brick clay are found in the vicinity. The city dates from the erection of the Hudson's Bay Company blockhouse in 1833. It was incorporated in 1874. The water works and electric-lighting system are owned and operated by the municipality. The United States is represented by a consular agent. Pop, 1901, 6130; 1911, 8306

NANAK. See NANEK.

NANA SAHIB, ná'ná sá'hīb (c.1825-c.60). A Hindu, one of the leaders of the Sepoy Mutiny of 1857. He is said to have been the son of a Brahman from the Deccan, and his real name was Dandhu Panth. He was born about 1825 and was adopted as a son in 1827 by Baji Rao, the childless ex-Peshwa of Poona, whose estate, which amounted to more than \$1,000,000, he inherited. He was refused, however, the annual pension of eight lakhs of rupees, or about \$400,000, which had been granted Baji Rao after his surrender in 1818. This rankled in his mind, although he was allowed to retain some of the state of a native prince, a retinue of 200 soldiers, with three fieldpieces, and a fortified residence at Bithur, 10 miles west of Cawnpore. He had long maintained an agent in England, Azim Ulla Khan, who told him tales of British weakness. When, therefore, the mutiny broke out in May, 1857, Nana Sahib offered to assist the English, but treacherously placed himself at the head of the mutineers in Cawnpore. The European troops were induced, on June 25, to capitulate to Nana Sahib, who promised they should be sent down the Ganges in safety. They embarked on boats provided for them, but had no sooner done so than a murderous fire was opened upon them. The sepoy were ordered to shoot the men, but to spare the women and children, who were removed to a house in Cawnpore. On July 15, Sir H. Havelock, who had advanced from Allahabad, defeated the sepoys in two engagements, one within 8 miles of Cawnpore, and Nana Sahib thereupon directed that the women and children should be put to death, and that their corpses should be cast into a well, which is now marked with a beautiful statue in their memory. A long series of engagements against Nana Sahib followed, in which he was always the loser; and he was ultimately driven beyond the English frontier into Nepal in 1859, where he probably perished in the jungle. On Oct. 21, 1874, a man supposed to be Nana Sahib was captured at Gwalior, but the identity was disproved. Consult Perceval Landon, *Under the Sun, Impressions of Indian Cities, with a Chapter Dealing with the Later Life of Nana Sahib* (London, 1906), and James Burgess, *The Chronology of Modern India, 1794-1894* (Edinburgh, 1913).

NANCHANG, nan'cháng'. The capital of the Province of Kiangsi, China, situated at the head of the delta formed by the Kan-kiang at its entrance into Poyang Lake, about 175 miles southeast of Hankow (Map: China, I 6). It is an important centre of the porcelain trade and for small manufactures. The city is surrounded by an alluvial plain of great fertility. Pop (est.), 150,000

NANCRÈDE, nán-kred', C(HARLES) B(EY-LARD) GUÉARD DE (1847-). An American surgeon, born in Philadelphia. He studied at the University of Pennsylvania and at Jefferson Medical College (M.D., 1883) and early practiced in his native city, holding various surgical

chairs and hospital appointments. After 1889 he was professor of surgery and clinical surgery and surgeon of the university hospital at the University of Michigan, and from 1900 to his retirement in 1913 also held a chair. During the Spanish-American War he served at the front as a surgeon. In 1908-09 he was president of the American Surgical Association. Among his writings are *Lectures upon the Principles of Surgery* (1899, 2d ed, 1905) and the following essays: "Injuries and Diseases of Bursæ" (1882); "Some of the Facts of Listerism" (1882); "Recent Advances in Surgery of the Brain and its Coverings" (1888); "The Laws of Physics and Ballistics the True Explanation of the Lodgment and Deflection of the Majority of Modern Small-Arm Projectiles, not the Ricochet Hypothesis" (1903). Nanerède also contributed interesting essays to a number of medical works.

NANCY, nan'sé'. The capital of the Department of Meurthe-et-Moselle, France, and an important railroad junction, 220 miles east of Paris and 94 miles west of Strassburg, on the left bank of the Meurthe, 6 miles above its junction with the Moselle (Map: France, N, M 4). It is a strongly fortified and well-built city, with fine squares, broad streets, and imposing edifices. The city owes much of its architectural ornamentation to Stanislas Leszczynski, King of Poland, who resided here as Duke of Lorraine. His statue stands in the Place Stanislas, the most important square in the city, which separates the old city on the northwest from the newer quarters on the southeast. It is surrounded by imposing edifices, including the theatre, the Hôtel de Ville, and the Episcopal Palace.

The Hôtel de Ville, dating from the seventeenth century, contains a fine ballroom with mural paintings by Girardet and fine galleries with paintings by Rubens, Van Ruysdael, and other noted masters. The Ducal Palace has been largely destroyed, but the single remaining wing is a good example of the Gothic style and holds the Musée Lorraine, a collection of historical and other antiquities. The cathedral of Notre Dame, a creation of the famous Mansart, is not of special interest, but the fifteenth-century church of the Cordeliers, attached to the Ducal Palace, has many fine monuments of the dukes of Lorraine. The church of Bon Secours contains the tomb of Stanislas. Nancy has seven fine triumphal arches, the most elaborate one being the Porte Royal, constructed under Louis XV. Among other structures of note are the Gothic church of Saint-Epvre, an ancient Gothic castle, and the Palais du Gouvernement, now used for military purposes.

Nancy has a university (see below), a noted school of forestry (the only one in France), a training college, an ecclesiastical seminary, a school of commerce, a conservatory of music, a botanic garden, a public library of over 142,000 volumes and 2127 manuscripts, and is the headquarters of one of the two French schools of hypnotism. There are numerous learned societies. Attached to the school of forestry is a valuable forestry museum. It is the seat of a bishop and the headquarters of the Twentieth Army Corps.

The situation of Nancy on the Eastern Canal and the Rhine-Marne Canal gives it a large trade. Its principal manufactures are tobacco, machinery, embroidery, hardware, boots and

shoes, straw hats, gloves, macaroni, chemicals, candles, glass, woolen goods, and agricultural implements. The great breweries here are among the most important in France. Not a few of the artistic specialties in furniture and in printing in France originated here. To facilitate traffic, a belt-line railway has been built. Pop, 1901, 102,559, 1911, 119,949.

Charles the Bold was overwhelmed and slain before the gates of Nancy in 1477 in battle against René of Lorraine and his Swiss mercenaries. Nancy was the seat of the dukes of Lorraine down to 1766, in which year it came to France. It was occupied by the Germans in 1870 and forced to pay a large ransom. The town grew greatly in general importance after the loss of Alsace-Lorraine by France, large numbers of Alsations coming here to live. Nancy was unsuccessfully attacked by the land and aerial forces of the Germans during the European War which broke out in 1914. See **WAR IN EUROPE**.

NANCY, UNIVERSITY OF. One of the leading universities of France, founded originally at Pont-à-Mousson. It had its inception in the Papal Bull of 1572, issued at the instance of the Cardinal of Lorraine, and consisted at first of two faculties, theology and arts. It was surrendered to the Jesuits to combat heresy. A law faculty was added in 1582 and a medical faculty in 1598. The university maintained a steady growth, and in 1608 its attendance reached about 2000. This growth was checked by the wars of the seventeenth century. In 1768 it was removed to Nancy by the order of Louis XV. During the stormy days of the French Revolution it went down with the rest of the French universities, but was not reorganized at the establishment of the University of France. In 1852, at the instance of 40 municipalities, a rectorate was established, and in 1854 the faculties of letters and science were organized. In 1864 the faculty of law and in 1871 the faculty of medicine, consisting mostly of professors who had come over from Strassburg University, were established. Until 1896 these were known as Facultés de Nancy and were under the control of the University of France, but with the dissolution of that university Nancy became autonomous. The University of Nancy consists of the faculties of law, medicine, sciences and letters, and the school of pharmacy. It also includes the chemical, serotherapeutic, electrotechnic, and agricultural and colonial institutes. The attendance in 1913 was 2248, about one-third of the students being enrolled in the faculty of sciences. The library contains 107,254 volumes and about an equal number of dissertations.

NANDA DEVI, nūn'da dā'vē. A peak of the Himalaya (q.v.).

NANDU, nān'dōō. The Brazilian name of the South American ostrich. See **RHEA**.

NANEK, nā'nēk, or **NANAK**, nā'nāk (1469-1538). Founder of the religious sect of Sikhs (q.v.). He was born at the village of Talwandi, now called Nankana, on the bank of the river Ravi, near Lahore, India, and was a Kshatriya in caste. In his youth he showed a tendency towards mysticism. He was at first a shepherd and afterward became a government official, in charge of the state's granary. He visited all the sacred places of India for the purpose of formulating the religious system he wished to introduce among his neighboring

tribes. He spent two years in the town of Livanobhon, where he associated himself with Kabir, the founder of a monotheistic sect. It was due to the influence of Kabir, whom Nanek often quotes in his book, that he determined to found a similar sect. Having previously made pilgrimages to Mecca and Medina, he returned to India, where he compiled the great work known as the *Adi-Granth*. For many years he traveled widely and proclaimed everywhere the doctrines of his new religion. He preached the abolition of caste, the unity of God, and the obligation to lead a pure life, and soon had a large following. Upon his death, which occurred in October, 1538, at Kartarpur in the Jalandhar Dob, his disciple Angad or Lakanā assumed the leadership of the sect. Ten apostles, or gurus as they are termed, are traced from Nanek down to Govind Sinh in 1708, with whom the succession stopped. Consult J. D. Cunningham, *History of the Sikhs* (London, 1849); Ernst Trumpp, *The Adi Granth or the Holy Scriptures of the Sikhs* (Leipzig, 1881); Sir J. J. H. Gordon, *The Sikhs* (London, 1904); M. A. Macauliffe, *The Sikh Religion: Its Gurus, Sacred Writings, and Authors* (6 vols., ib., 1909).

NANGASAKI, nān'ga-sū'kē. A seaport of Japan. See NAGASAKI.

NANINI, nā-nē'nē, GIOVANNI MARIA (c.1540-1607). An Italian composer, born at Tivoli. He opened the first public school of music ever controlled by an Italian musician in Rome. The famous Palestrina and a nephew, Bernardino, were two of his assistants. He succeeded Palestrina as maestro at Santa Maria Maggiore in Rome and in 1577 became a member of the papal choir. Three years before his death he was appointed maestro di cappella of the Sistine Chapel. A six-part motet, *Hodie nobis Calorum Rex*, composed by him is sung annually on Christmas morning in the Sistine Chapel. Some of his most important works remain in manuscript and are the private property of the Sistine Chapel and the Vatican Library. His printed works include motets, madrigals, canzonets, and Church pieces, most of which examples are regarded as representing the best of the Palestrina period. He died at Rome. Consult Giuseppe Radiciotti, *Giovanni Maria Nanini* (Pesaro, 1906).

NA'NISM (from Gk *vānos*, *nanos*, dwarf). In plants the condition of inherent dwarfness. It is a transmitted character, and plants possessing it have only dwarf offspring. Sometimes such dwarf plants have appeared suddenly, but have reproduced true to seed, giving rise to a new race of small individuals such as is seen in a mutant from the evening primrose (*Oenothera lamarckiana*). The original plant appeared in the cultures of Hugo De Vries, was much smaller than its parent, and, producing offspring like itself, became known as a new species (*Oenothera nanella*). Among alpine plants some are inherently dwarf, illustrating nanism, while others develop into tall plants under favorable conditions. See DWARF, ALPINE PLANT, ARCTIC REGION. MUTATION.

NANKEEN. A fabric which was formerly exported extensively from China and was said to be the manufacture of Nanking, the natural color of the *Gossypium religiosum* fibre, from which it was made, a yellowish buff, being a favorite one. In the middle of the nineteenth century this material was much used for clothing, especially for trousers. Lately nankeen

has been largely superseded by ordinary cotton, which is artificially colored to imitate the genuine fabric.

NANKING' (Chin., southern capital). The capital of the Province of Kiangsu, China. It is 194 miles northwest of Shanghai, near the Yang-tse River, in lat 32° 40' N. and long. 118° 47' E. (Map China, L 5). It was made the capital of the Empire and called Nanking in 1368, but was the capital only until 1403. Its official name under the Manchu dynasty was Kiangning. It is an ancient city, having been the capital of its province as far back as 317-582 A.D. It was famous as a literary centre and for its fine arts, manufactures, and monuments. It was captured by the Taiping rebels in 1853, who held it for more than a year. They destroyed the beautiful porcelain tower from fear of its geomantic influences and so injured the city that it has not yet recovered fully. The first British treaty was signed in Nanking in 1842. Its present importance in part is from its military college, arsenal, and factories for the making of war material. It is a centre of missionary activity. The climate is exceedingly unhealthy. The population is estimated at 267,000 according to the customs estimate of 1910. It was opened to foreign trade in 1899, but its commercial importance suffers from its proximity to Chinkiang (q.v.). In the vicinity are the famous Ming tombs. In 1913 the net imports amounted to 6,437,554 hk. tls., and the exports to 1,687,787 hk. tls.

NAN'NING'. A treaty port of south China, in the Province of Kwangsi, situated at the head of navigation on the Yu-kiang River, 320 miles west by south of Canton (Map China, J 7). It is one of the principal trading stations near the south frontier and is one of the open ports. In 1913 the imports amounted to 3,260,000 hk. tls., and the exports to 1,009,132 hk. tls. The city as a trade centre is second in importance to Wuchow and is clean and well ordered, with numerous educational and banking establishments. Pop., 37,000.

NAN'NINOSE (corruption of American Indian *mananosay*), or **MAN'NINOSE**. A local name in use along the South Atlantic coast for the soft clam (*Mya arenaria*). See CLAM.

NANSEN, nān'sen, FRIDTJOF (1861-). A Norwegian Arctic explorer, naturalist, and author, born near Christiania, Norway. He was educated in the University of Christiania and was trained as a zoologist. In his twenty-first year he undertook a trip to East Greenland waters for zoological specimens, the same year he was appointed curator in the Natural History Museum at Bergen. He became known to the world as the first man to cross the ice cap of Greenland, an adventurous journey from the east to the west coast, undertaken in 1888, which he described in two volumes, *The First Crossing of Greenland* (1890). He spent the winter of 1888-89 among the West Greenland natives, which resulted in a volume on *Eskimo Life* (1893). After his return to Norway he was appointed curator in the Museum of Comparative Anatomy at Christiania University, where he became professor of zoology in 1897 and after 1907 was professor of oceanography. From his twenty-third year he was constantly planning for the great journey into the polar regions, upon which he did not embark till 1893. He had unusual natural and acquired qualifications for the work, and his winter among the

Eskimo was of inestimable value to him in his later experiences.

Nansen inferred, partly from the appearance in Greenland of a pair of trousers which had been left upon the ice north of Siberia when the *Jeannette* was abandoned, partly from the presence in Greenland of driftwood from Siberia, and partly from the experience of other explorers, that a ship driven with the ice by prevailing winds might drift from above Siberia across or near the pole. The weight of Arctic authority did not support this idea, nevertheless, with the assistance of the government and private citizens, Nansen built and equipped the Arctic exploring vessel *Fram* (Forward), left Norway in 1893, skirted the north coasts of Europe and Asia, put into the polar pack ice near the New Siberia islands on Sept. 22, 1893, and drifted northwest till March 14, 1895. On that day, with a single companion, Lieutenant Johansen, he left the *Fram* frozen in the pack and started towards the Pole with dog sledges. On April 7, 1895, he reached lat. 86° 14' N., within 272 statute miles of the North Pole and 184 miles nearer to it than any man had ever been before him. Further progress was impossible, and he retreated to Franz Josef Land, where he and Johansen spent the winter in a snow hut, living on Arctic game.

In the spring they started southward for Spitzbergen, but fortunately found the winter camp of the Harmsworth expedition under Jackson and returned home on the ship of that party, reaching Vardø, Norway, Aug. 13, 1896. Meanwhile the *Fram* drifted around to the north of the Franz Josef Land archipelago, reaching lat. 85° 57', then blasted her way southward to open water, and reached Vardø within a week after Nansen's arrival there. Nansen wrote: *Farthest North* (2 vols, 1897; new ed., 1897), a popular description of the expedition and a classic in the literature of travel (translated into many languages); *The Norwegian North Polar Expedition, 1893-96: Scientific Results* (6 vols, 1900-06); *Die norwegischen hydrographischen Untersuchungen im Nordmeere* (1906), with B. Helland-Hansen; *The Norwegian Sea: Its Physical Oceanography* (1909); "Videnkab og Moral," in *Samtiden* (1908); *In Northern Mists: Arctic Exploration in Early Times* (2 vols, 1911), *Through Siberia, the Land of the Future* (2 vols, 1914); and numerous articles in scientific journals.

Nansen found no form of life above the eighty-fourth parallel. His discovery of a wide sea of oceanic depth north of the New Siberia islands overthrew the theory of the prevailing shallowness of the Arctic Ocean. He discovered no land except a few little islands near the Asian coast; and the free movement of the ice masses, driven, as Nansen observed, by the winds in every direction, has led some geographers to conclude that there is no large land near the North Pole. (See POLAR RESEARCH.) In oceanography Nansen did work of great importance. On his initiative there was organized in 1892 the International Commission for Systematic Study of the Ocean, having headquarters in Copenhagen and laboratories in Christiania. Of the laboratories he was director till 1908. Also prominent in a political connection, especially in the movement which led to the separation of Norway and Sweden, Nansen wrote on this subject *Norway and the Union with Sweden* (1905, also in Norwegian,

German, and French). To the *Times* (London), the *Temps* (Paris), and to German papers he contributed political articles. From 1906 to 1908 he served as Norwegian Minister to Great Britain. Consult Frederick Dolman, *Dr Nansen: The Man and his Work* (London, 1897), and W. C. Brögger and Nordahl Rolfsen, *Fridtjof Nansen, 1861-93*, English translation by William Archer (ib., 1906).

NANSEN, HANS (1598-1667). Burgomaster and President of Copenhagen, born at Flensborg. He entered the Icelandic Company, made many commercial journeys to north Russia and Iceland, and became wealthy. In 1639 he was made councilman of Copenhagen and in 1644 burgomaster. During the serious events of 1658-60 the burghers placed their confidence in him, and he came to have influence with the King, as shown by his participation in the change of government in 1660. On his advice the burghers of Copenhagen decided to offer the King the hereditary government; but it seems certain Nansen did not want despotism introduced. In 1660 he was made President of Copenhagen and in 1661 member of the Supreme Court.

NANSEN SOUND. See HEIBERG LAND.

NANTERRE, nan'tär'. A town of France in the Department of Seine, situated at the foot of Mount Valérien, a few miles west of Paris. According to the tradition, it is the birthplace of St. Geneviève, the patron saint of Paris. It manufactures chemicals and aluminium. Pop. (commune), 1901, 14,140; 1911, 21,349.

NANTES, nânt. An important seaport town, the largest city of Brittany, and the capital of the Department of Loire-Inférieure, France, situated on the right bank of the Loire, 35 miles from the sea and 250 miles by rail southwest of Paris. Here the Erdre and the Sèvre Nantaise join the Loire (Map: France, N, D 5). There is communication with the interior on the Loire and the canal to Brest. This handsome and well-built city has many striking and beautiful buildings, among them the cathedral of St. Pierre with beautiful monuments. The modern Bourse is one of the finest buildings in France. There are a public library containing 210,000 volumes, a museum of paintings and fine arts with works of modern French masters, a museum of natural history, an ecclesiastical college, a training college for girls, a school of medicine and pharmacy with a library of 25,000 volumes, also colleges of law, dentistry, music, art, navigation and technical subjects, several learned societies, and three theatres. A beautiful promenade, formed by the Cours St. Pierre and the Cours St. André, extends from the Erdre to the Loire. It is planted with four rows of trees, bordered with lines of palatial houses, and ornamented with statues. On the banks of the river there are 5 miles of quays. Formerly vessels of 200 tons only could reach the port, but a ship canal on the left bank now admits sailing vessels and steamers of 20-foot draft directly to Nantes. In 1914, \$5,500,000 was spent in harbor improvements. In the manufacture of sugar Nantes stands next to Paris and Marseilles, its shipbuilding industry and its tobacco factories are important; there are also iron, copper, and lead foundries, oil and soap works, food-preserving establishments, saw mills, and manufactures of railroad material, of cotton and woolen goods, chemicals, tiles, leather, rope, wood pulp, brushes, glass,

chocolate, and cement. It is the seat of a bishop and the headquarters of the Eleventh Army Corps.

Nantes, anciently *Condivincum*, was founded before the Roman conquest. It took its present name from that of a Gallic tribe, the *Namnetes*. It was the capital of the Duchy of Brittany, and its history until the fifteenth century is a record of struggles with successive invaders in defense of its independence. In 1491 the duchy was united to France by the marriage in the castle of Anne of Brittany to Charles VIII, King of France. The castle also witnessed the signing of the famous Edict of Nantes (q.v.) by Henry IV in 1598. From the fifteenth century the commerce of the town began to develop, and in the seventeenth and eighteenth centuries its prosperity increased on account of the slave trade, but by 1790 Nantes had declined greatly in importance. During the Revolution it was the scene of the *noyades* and other atrocities of the infamous Carrier (q.v.). Pop., 1901, 132,990, 1911, 170,535. Consult: E. Maillard, *Nantes et le département au XIX^{ème} siècle* (Paris, 1891); F. Lebaudière, *Histoire de Nantes sous le règne de Louis-Philippe, 1830-48* (ib., 1900); G. Durville, *Etudes sur le vicux Nantes* (ib., 1900-01); E. Destranges, *Le théâtre à Nantes depuis ses origines jusqu'à nos jours, 1430-1901* (ib., 1903).

NANTES, EDICT OF. The name given to the famous decree signed in the city of Nantes by Henry IV of France, April 13, 1598, which secured to the Protestant portion of his subjects partial freedom of religion. The document consisted of 95 patent or public articles and 56 secret or close ones, and among its chief provisions were the following: the proclamation of a full amnesty; the granting of liberty of conscience to the Huguenots; the permitting to Huguenot chiefs and noblemen of public religious exercises attended by themselves, their families, and the families of their dependents. In addition the Huguenots were to be allowed to establish new churches, except in Paris and the surrounding districts and in the royal residences, and to maintain universities, or theological colleges, of which the Huguenots had four, those at Montauban, Saumur, Montpellier, and Sedan. Adherents of the reformed faith were also to be eligible to all civic offices and dignities, but they were obliged outwardly to celebrate the festivals of the Catholic church and to pay tithes to the Catholic priesthood. In each Parlement a *chambre de l'édit* was created to take cognizance of all cases arising out of the act and to supervise its working. Owing to the difficulties and delays in registering the Edict of Nantes, it was not published until a year after it had been signed by the King. It remained in force until revoked by Louis XIV in October, 1685. See HUGUENOTS.

NANTEUIL, nān'tē'y', ROBERT (1630-78). A French portrait engraver, born at Rheims. He studied in his native city under Nicolas Regnesson. About 1648 he went to Paris and there perfected himself in the use of crayon and pastel. He drew his portraits from life as well as engraved them, and soon attained great popularity. His plates having come to the King's notice, he was appointed designer of the cabinet (1658), and at his demand Louis XIV issued the decree of 1660, dated from St. Jean de Luz, by which engraving was raised to the status of a fine art. He also exercised a strong

influence over the school of engraving established by the King. After his death Nanteuil suffered neglect, and has only recently been recognized as one of the greatest portrait engravers of all time. He confined himself to heads, many of them life size, which show rare precision of draftsmanship, masterly modeling, and convincing characterization. They are simply composed and possess decided color and great fullness of tone. He left over 200 plates, including 11 portraits of Louis XIV, 2 of Anne of Austria, 14 of Cardinal Mazarin, and portraits of Madame de Sévigné, Colbert, Nicolas and Basile Fouquet, the Duke de Bouillon, and many other celebrities of the time. Consult Metcalfe, "Robert Nanteuil," in *Prints and their Makers* (ed by Carrington, New York, 1912).

NANTICOKE. A former important Algonquian tribe of Maryland. They were noted for their dark complexion and peculiar customs and ceremonies, from which they acquired the reputation of being a tribe of sorcerers. Their power was broken by the Iroquois in 1678. In 1707 they had seven villages, and in 1722 their principal village still contained about 100 inhabitants and was the seat of an "empress," who ruled over all the neighboring Indians. The whole tribe then numbered about 500. Soon afterward they began a gradual removal to the Iroquois country, and settled in several villages on the eastern branch of the Susquehanna, in southern New York, although a portion of them continued to reside in their old country. In 1753 a part of those on the Susquehanna became incorporated with the Iroquois, but the majority removed to the Ohio and joined the Delaware tribe, with which they became completely merged. There are still several score of mixed-blood Nanticoke in southern Delaware.

NANTICOKE. A borough in Luzerne Co., Pa., 7 miles west-southwest of Wilkes-Barre, on the Susquehanna River and on the Pennsylvania, the Delaware, Lackawanna, and Western, and the Central of New Jersey railroads (Map Pennsylvania, J 4). It is chiefly engaged in mining and preparing for market anthracite coal, but has also silk-throwing mills, hosiery mills, a canning factory, cigar factory, etc. There is a State hospital here. Settled in 1850-55, Nanticoke was incorporated in 1874; it is governed under the charter of that date, which provides for a burgess, elected every three years, and a unicameral council. Pop., 1900, 12,116; 1910, 18,877, 1914 (U. S. est.), 21,756.

NANTUCKET. A town and the county seat of Nantucket Co., Mass., coextensive with Nantucket Island and several small outlying islands, 50 miles southeast of New Bedford, with which it has steamboat communication (Map: Massachusetts, G 8). Nantucket is widely noted as a summer resort, presenting much of picturesque and historic interest. It was formerly the seat of a great whaling industry, but at present the community is engaged principally in fishing and agriculture. The town, including within its corporate limits several villages, contains the Athenæum (public library), Admiral Sir Isaac Coffin's Manual Training School, a museum, and a courthouse. The government is administered by town meetings. Pop., 1900, 3006, 1910, 2962.

In 1659 the first settlers, headed by Thomas Macy, came to the island and settled at Madeket, the present site of Nantucket not having been chosen until 1673. Consult: L. S. Hinchman, *Early Settlers of Nantucket, their Assoc-*

ates and their Descendants (2d ed., Philadelphia, 1902); H. B. Worth, *Nantucket Lands and Landowners* (Nantucket, 1901-10), R. A. Douglas-Lithgow, *Nantucket* (New York, 1914).

NANTWICH, nânt'ich. A market town and urban district in Cheshire, England, on the Weaver, 18 miles southeast of Chester (Map: England, D 3). The parish church of St. Mary and St. Nicholas is an excellent example of the Decorated and Perpendicular Style. Nantwich was famous in former times for its brine springs and salt works; the baths are still used. Shoes, gloves, clothing, cotton goods, ironware, and ale are manufactured. The town owns its water supply and markets. It is well known as a fox-hunting centre. Nantwich dates from the Roman period, and was formerly called Halen Gwyn (the white salt town). Pop., 1901, 7722; 1911, 7815.

NANTYGLO (nân'ti-glô) **AND BLAINA** (blâ'na). A town in Monmouthshire, England, 7 miles west of Abergavenny. It has important coal-mining and iron industries. Pop., 1901, 13,500, 1911, 15,395.

NAOGEORG, nâ'ô-gâ-ôrk', THOMAS (1511-63). A German Protestant dramatist, whose name in the vernacular was Kirchmeyer. He was born at Hubelschmeiss, near Straubing, possibly studied at Tübingen, and in 1535 became pastor. His Latin poems, all animated by the most bitter opposition to the papacy, include the dramas *Pammachius* (1538), *Incendia seu Pyrgopolinices* (1541), *Mercator seu Indicum* (1541), and the satiric poem *Regnum Papisticum* (1553). These were often rendered into German, and were long popular, as were his weaker biblical dramas, *Hamanus* (1543), *Hieremias* (1551), and *Judas Iscariotes* (1551).

NAÓN, nâ-ôn', RÓMULO S. (1875-) An Argentine diplomat, born in Buenos Aires. He was educated in the university there and later served on the faculties of the National College and the University of Buenos Aires. Entering politics, he was elected representative in the national Congress in 1902 and six years later was made Minister of Justice and Public Instruction. In 1911 he was sent to the United States as Envoy Extraordinary and Minister Plenipotentiary, and when the Legation was raised to the rank of Embassy (1914), he became the first Ambassador. He was secretary of the Argentine delegation to the Second Hague Conference, and in 1914 was a member, with Ambassadors Da Gama and Surez, of the A. B. C. (Argentina-Brazil-Chile) Peace Conference at Niagara Falls, Ontario, which endeavored to adjust the difficulties of the United States and Mexico. For their services the mediators were thanked by Congress and given medals. Naón is author of works on political science, constitutional law, and educational subjects. As a member of the Governing Board of the Pan-American Union Naón actively promoted Pan-Americanism. He received honorary degrees from Yale, Brown, and the University of Pittsburgh.

NAOROJI, nou'rô-jê, DADABHAI (1825-). The first Indian member of the British House of Commons. The son of a Parsi priest, he was born at Bombay and educated in the school of that city which afterward became the Elphinstone Institution. He was appointed professor of mathematics and of natural philosophy there in 1854, but after 1855 he lived chiefly in England. He was instrumental in

founding the East India Association in 1867, and three years afterward he succeeded in having certain positions in the civil service opened to native Indians. In 1874 he was made Prime Minister to the Prince of Baroda. From 1885 to 1887 he was a member of the Bombay Legislature, and he was president of the Indian National Congress in 1886, 1893, and 1906. He was a Liberal member of Parliament for Central Finsbury in 1892-95, and in 1895 was appointed a member of the royal commission to inquire into Indian affairs. His publications include: *England's Duties to India* (1867); *The Wants and Means of India* (1870), collected articles published in 1887, *Poverty and Un-British Rule in India* (1901); *Correspondence with Lord George Hamilton* (1900-01); *The Rights of Labour* (1906).

NA'OS (Gk. ναός, Attic νεός, from *naein*, *naein*, to dwell). The central chamber of a Greek or Græco-Roman temple. See ARCHITECTURE, Greece, CELLA, GREEK ART, Architecture: *The Temple*, PRONAOS.

NAPA, nâ'pâ. A city and the county seat of Napa Co., Cal., 46 miles by rail northeast of San Francisco, on the navigable Napa River and on the Southern Pacific Railroad (Map: California, C 4). The State Hospital for the Insane is situated on the outskirts of the city, and there are several places of interest, including the Napa Soda Springs, Napa Redwoods, Calistoga Hot Springs, and petrified forests. Napa contains also a public library and a fine high-school building. The leading industries are fruit growing and the manufacture of tanned leather, shoes, gloves, wine, shirts, boxes, olive oil, and woolen goods. At Napa Junction there are Portland-cement works, the vicinity having extensive deposits of cement rock. Settled in 1847, Napa was incorporated in 1863. Pop., 1900, 4036; 1910, 5791.

NAP'ANEE'. A town, port of entry, and the capital of the united counties of Lennox and Addington, Ontario, Canada, situated on the Napanee River, 7 miles from its mouth and 28 miles by rail west of Kingston, and on the Canadian Northern and Grand Trunk railways (Map: Ontario, H 5). It possesses county buildings, a collegiate institute, a public park, race track, and its industrial establishments include flour mills, foundries, manufactories of bricks and tiles, furniture, motor boats, and carriages. Pop., 1901, 3143; 1911, 2807.

NAPATA, nâ-pâ'tâ. The ancient capital of Ethiopia (q.v.), mentioned in inscriptions as early as 1450 B.C., and later the seat of independent kings. It was rivaled by Meroë (q.v.) after the Persian period. For the ruins of the city, destroyed by Petronius, see BARKAL.

NAPERVILLE. A city in Dupage Co., Ill., 29 miles by rail west of Chicago, on the Dupage River and on the Chicago, Burlington, and Quincy Railroad (Map: Illinois, H 2). The city, chiefly a residential place, has the Nichols Library, Edward Sanatorium, and is the seat of Northwestern College (Evangelical Association), established in 1861, and of the Evangelical Theological Seminary. There are quarries, nurseries, and manufactories of lounges, chairs, gloves, brick and tile, and fly net. The water works and electric-light plant are owned and operated by the municipality. Naperville was settled in 1830 and was incorporated in 1857. It has adopted the commission form of government. Pop., 1900, 2629; 1910, 3449.

NAPHTALI. According to Gen. xxx. 7-8, the fifth son of Jacob and the second born to him by Bilhah. In the actual history of Israel the tribe Naphtali plays but a minor part. Its territory lay in the north, bordering on the Sea of Galilee and Lake Merom, which is probably referred to in Deut xxxiii 23, where the Masoretic text has the impossible Darom (See MEROM.) According to Judg. iv 6, Barak came from Kedesh in Naphtali, but it is doubtful whether the addition "Naphtali" is correct here, though both the clans Naphtali and Zebulon were involved in the struggle against the King of Hazor (See DEBORAH.) According to Josephus (*Wars*, iii, 3, 2) the Naphtalites were men of valor. Their dangerous position as a border tribe made them among the first to fall into the hands of Tiglath-pileser IV of Assyria (734 B.C., cf 2 Kings, xv 29). In the religious development of Israel the tribe plays no part, but in the postexilic period Tiberias (qv), on the western shore of the Sea of Galilee, comes into prominence, and after the destruction of Jerusalem it became one of the centres of Jewish learning. Ancient and modern writers alike praise the soil and the climate of the territory of Naphtali.

NAPHTHA, năp'thă (Lat., from Gk *νάφθα*, Av *napta*, Pers *naft*, moist, connected with Lat. *Neptunus*, Neptune, name of the sea god). A term originally applied to an inflammable liquid which exudes from the soil in certain parts of Persia. Subsequently the use of the term spread to include some of the more volatile oils found in Europe and even in America. The product of the oil fields of southern Russia is usually called naphtha, although it differs in no way from the ordinary grades of petroleum. Naphtha properly includes the lighter oils which pass off first in the distillation of petroleum, the gravities ranging from 90 to 62 degrees Baumé. Pennsylvania crude oil contains from 8 to 20 per cent of naphtha. In the refining of such naphtha several products are obtained by fractional distillation, those which pass off first, viz., rhigolene and cymogene, are gases at ordinary temperatures and are seldom saved. The next product is known as gasohne, a material largely used in machines and for illuminating purposes. After this come stove naphtha and gas naphtha, the latter being the base of much of the illuminating gas now made. Petroleum naphtha is often treated with chemicals to deodorize it. Naphtha may also be obtained in the distillation of wood and coal tar. See PETROLEUM.

NAPHTHALENE (from *naphtha* + *alcohol*), $C_{10}H_8$. A crystalline solid chemical compound of carbon and hydrogen, found abundantly in coal tar (q.v.). The crystalline mass obtained from this source is pressed, warmed with a solution of caustic soda, next washed with hot water, then heated with a little strong sulphuric acid, thoroughly washed again with water, and finally distilled in a current of steam or subjected to a process of sublimation. When thus obtained in the pure state, naphthalene melts at $80^{\circ}C$ ($176^{\circ}F$), and boils at $218^{\circ}C$ ($424^{\circ}F$). It has a peculiar characteristic odor, is insoluble in water, but freely soluble in ether and in hot alcohol. It is largely used in the manufacture of coloring substances and to some extent also as an enricher for ordinary illuminating gas. The molecule of naphthalene is composed of two rings of carbon

atoms, with hydrogen atoms attached to them, and its constitution is represented by either of the following graphic formulas:

A number of interesting derivatives of this hydrocarbon are obtained by the action on naphthalene of chlorine, nitric acid, etc. The most important derivatives commercially are the so-called sulphonic acids. By acting on naphthalene with an excess of sulphuric acid we obtain naphthalene-sulphonic acid, $C_{10}H_7SO_3H + H_2O$, from which, by substitution processes, a large number of compounds are produced, many of these finding employment in the color and dye industry.

NAPHTHOL (năf'thōl) **YELLOW.** See COAL-TAR COLORS.

NAPIAS, nă'pyă', HENRI (1842-1901). A French physician, born in Sézanne, Marne. He studied medicine in Paris, graduating in 1870. Settling in the French capital, he filled several hospital offices, becoming a member of the Académie de Médecine and serving as president of the Assistance Publique. Among his books and essays, which number nearly 100 and which deal mostly with public hygiene, may be mentioned *Des moyens de diminuer les dangers qui résultent pour les travailleurs des différentes industries de l'emploi des substances minérales toxiques* (1878), *Manuel d'hygiène industrielle* (1882), *L'Hygiène scolaire en France, etc* (1887), *L'Hygiène des crèches* (1891), *Hygiène hospitalière et assistance publique* (1893); *Réglementation des crèches publiques et privées* (1898).

NAPIER, nă'pī-ēr. The capital and chief port of Hawke's Bay County and Provincial District, North Island, New Zealand, on the east coast (Map. New Zealand, N I, C 6). Wool is the chief export; there are also large exports of timber, canned and frozen meats. The principal public buildings comprise the town hall, a hospital, lunatic asylum, and atheneum. The Anglican cathedral of St. John, the seat of the Bishop of Waiapu, is one of the finest churches in New Zealand; it was built in 1888 of brick, in the early English style. Napier has railway communication with Wellington and New Plymouth. Pop, 1901, 9015; 1911, 10,537 and including the suburbs which lie to the north of the town, 11,736. The population of the provincial district, excluding Maoris, was 48,546 in 1911.

NAPIER, ARTHUR SAMPSON (1853-1916). An English philologist, born in Cheshire. He received his early education at Rugby, attending later Owens College, Manchester, and Exeter College, Oxford, where he was granted the degree of doctor of letters. From 1878 to 1882 he was reader of English at the University of Berlin, where, having continued his studies, he took the Ph.D. at the end of this period. After three years as professor of English at the University of Göttingen, in 1885 he was elected Merton professor of English at Oxford, and in 1903 also Rawlinson professor of Anglo-Saxon in the same institution. He became a fellow of the British Academy and received

honorary degrees from Manchester and Groningen. His publications include, *Ueber die Werke des altenglischen Erzbischofs Wulfstan* (1882), his doctoral dissertation; *Wulfstan-Sammlung* (1883), *History of the Holy Rood-Tree* (1894), for the Early English Text Society, *Crawford Collection of Early English Charters* (1895), with Stevenson, *Old English Glosses* (1900), *The Franks Casket* (1901), besides many contributions to learned reviews.

NAPIER, nāp'yēr or nā-pēr', SIR CHARLES (1786-1860). A British admiral. His father was the Hon. Capt. Charles Napier, R.N., second son of Francis, fifth Lord Napier. He was born at the family seat, Merchiston Hall, Stirling, Scotland, March 6, 1786. At 13 he went to sea as a naval volunteer. He was made a lieutenant in 1805, took part in an important engagement in the West Indies in March, 1806, received command of the *Recruit*, 18 guns, in 1808, and in an engagement with the *Diligent* his thigh was broken. He was put on half pay for a time, but volunteered in the Peninsular army and was wounded at Busaco. In 1814 he was ordered to America and took an active part in the operations against Baltimore. In 1829 he received the command of the *Galatca*, a 42-gun frigate, and was employed "on particular service" on the coast of Portugal. He accepted the command of the fleet of Dom Pedro, the father of the young Queen, Maria da Gloria, in the struggle against her uncle, Dom Miguel, and by defeating the Miguelite fleet hastened the downfall of the usurper. He was made admiral in chief of the Portuguese navy, but soon returned to England. In the war between the Porte and Mehemet Ali he organized a land force, with which he stormed Sidon and defeated Ibrahim Pasha among the heights of Mount Lebanon. He took part in the naval attack on Acre. He next blockaded Alexandria and concluded a convention with Mehemet Ali. For these services he was knighted, and in 1847 he received the command of the Channel fleet. When the Russian War broke out he was sent out to command the Baltic fleet, but had to content himself with a prudent and successful blockade of the strongly fortified ports, which somewhat disappointed public expectations of more daring achievements. He twice sat in Parliament and until his death labored with success to reform the British naval administration. He was a man of great personal courage and decision of character, but selfish, vain-glorious, and arrogant. These traits are strongly marked in his works: *The War in Portugal* (1836), *The War in Syria* (1842); *The Navy. Its Past and Present State* (1851). Partiality marks the biography by his stepson Gen. Elers Napier, *The Life and Correspondence of Admiral Sir Charles Napier* (London, 1862).

NAPIER, SIR CHARLES JAMES (1782-1853). A celebrated British general, son of Col. George Napier. He was born at Whitehall, Aug. 10, 1782, and in his twelfth year received a commission in the Thirty-third Infantry. His first military experience was in Ireland in 1798. His next active service was in Spain during the Napoleonic wars, and he commanded the Fifth Infantry at Coruña, where he was wounded and taken prisoner. Marshal Ney dismissed him on parole, and he went to England, but returned in 1810 to the Peninsula after having been exchanged. At Coa he fought as a volun-

teer and had two horses killed under him. At Busaco a shot in the face broke his jaw and injured an eye, but he recovered in time to be present at the battle of Fuentes de Oñoro and the second siege of Badajoz, both in 1811. In the summer of 1813 he was with the fleet under Beckwith, and afterward under Cockburn, engaged in desultory operations on the coast of the United States. In 1815 he took part in the storming of Cambrai, and marched into Paris with the allied armies. From 1822 to 1830 he was Resident (Governor) of Cephalonia, one of the Ionian Islands, the affairs of which he administered with great energy and intelligence. In 1841 he was ordered to India to take command of the army at Bombay. The most splendid service of his life now began and resulted in the conquest of Sind against great odds. In the battle of Miani, 1843 Napier with about 3000 troops attacked a strongly posted native force ten times as great, and defeated it, killing more than 6000 men. Thereupon all the ameers surrendered with the exception of Shir Muhammed, who brought 25,000 men into line of battle at Hyderabad. In three hours Napier's little army of 5000 men gained a decisive victory, and a few days afterward the English general was master of Sind. The Governor-General, Lord Ellenborough, made him Governor of the conquered territory, but though his administration was very successful, as were also various campaigns against the hill tribes Napier retired in 1847, after having quarreled with the directors of the East India Company. During the Sikh War of 1848-49 he again went to India, but arrived too late to take part in the conflict. After having put down a mutiny among the native soldiers, he returned to England in 1850, having quarreled with the Governor-General, Lord Dalhousie. He retired to the Hampshire Downs, near Portsmouth, busying himself with literary labors. There he died on Aug. 29, 1853. Napier was a man brave to rashness, quarrelsome with his superiors but beloved by his soldiers, and one of the most remarkable of the military men of his time. He wrote: *The Colonies: Treating of their Value Generally, of the Ionian Islands in Particular* (1833); *Colonization, Particularly in Southern Australia. With Some Remarks on Small Farms and Overpopulation* (1835); *Remarks on Military Law and the Punishment of Flogging* (1837); *Defects, Civil and Military, of the Indian Government* (1853). Consult. W. F. P. Napier (brother), *The Life and Opinions of General Sir Charles Napier* (4 vols., London, 1857), W. N. Bruce, *Life of General Sir Charles Napier* (ib., 1885), T. R. E. Holmes, *Four Famous Soldiers* (ib., 1889); W. F. Butler, *Sir Charles Napier* (ib., 1890).

NAPIER, SIR FRANCIS, BARON ETRICK (1819-98). A British diplomat and administrator, born at Thirlestane in Selkirkshire, Scotland. He was educated at Trinity College, Cambridge, entered the diplomatic service in 1840, was attaché at Vienna and at Constantinople, Secretary of Legation at Naples, Envoy at Washington and The Hague, and Ambassador to St. Petersburg (1860-64) and at Berlin (1864-66). At Naples, Berlin, and St. Petersburg he acted with a tact, firmness, and suavity that smoothed over or straightened out difficult situations. The British government, convinced of his ability in other fields, transferred him in 1868 from Berlin to India as Governor of

Madras, where he remained for six years. His administration of this presidency was specially able in measures for the prevention of famine and disease. In the latter he was assisted by the experience of Florence Nightingale (q.v.), with whom he had a lengthy correspondence. He also completed irrigation works then partly finished and devised others which were afterward constructed. He met the famine in Ganjam, in the northern part of Madras, with prompt relief. As head of the senior presidency he did much to soften the often strained relations between the central and the minor governments of India. The assassination of the Earl of Mayo (q.v.) in 1872 made Napier Governor-General of India for a few months, after which he returned to England and was made a peer of the United Kingdom, Baron Ettrick of Ettrick. He was expected to attain high office, but lack of a private fortune hampered his political ambitions and restricted his activity to social and charitable work. He died suddenly at Florence.

NAPIER, JOHN (1550-1617). A Scottish mathematician, born at Merchiston, now a part of Edinburgh. He was educated at St Andrews and probably also abroad. His natural pugnacity of character often involved him in difficulties with his neighbors and tenants. In 1594 he published his *Plaine Discovery of the Whole Revelation of St John* (2d ed., London, 1611), in which he sought to prove that the Pope was Antichrist. In somewhat the same spirit, ostensibly to defend his country from "the enemies of God and true religion," he made some secret inventions, including burning mirrors, a piece of artillery, and a chariot of metal, none of which had any more merit than his theological contributions. Napier's fame rests on his mathematical discoveries, and he is chiefly known as the inventor of logarithms (q.v.). In his earlier investigations he seems to have been considering the subject of imaginary roots, and he refers to this as an important algebraic secret. The idea of logarithms seems to have occurred to him as early as 1594, and thenceforward the rest of his life was spent in developing the idea and computing logarithmic tables. He also invented some mechanical devices for computation, known as Napier's rods (See CALCULATING MACHINES). By means of these multiplication and division can be performed, and square and cube roots extracted. He was also the inventor of a number of formulas in trigonometry, known as Napier's circular parts (See CIRCULAR PARTS). Napier was one of the first English writers to make any valuable contribution to mathematics, and his discoveries mark an epoch in the history of science. His chief writings are: *De Arte Logistica* (written in 1573, published in 1839); *Mirifici Logarithmorum Canonis Descriptio* (1614 and subsequent editions; Eng. trans., 1616 and 1857); *Mirifici Logarithmorum Canonis Constructio* (1619; Eng. trans., 1889); *Rabdologia seu Numerationis per Virgulas Libri Duo* (1617). Consult: Earl of Buchan, *Life of Napier* (Edinburgh, 1787); Mark Napier, *Memoirs of Napier* (ib., 1793); Gibson, *Napier and the Invention of Logarithms* (Glasgow, 1914), an address published in the *Proceedings of the Royal Philosophical Society of Glasgow*; E. W. Hobson, *John Napier and the Invention of Logarithms 1614* (Cambridge, 1914). A complete edition of Napier's works appeared in Edinburgh in 1839. A bibliography

of Napier's works, by Macdonald, may be found in the English translation of the *Mirifici Logarithmorum Canonis Constructio* mentioned above. In July, 1914, a tercentenary commemoration of the publication of the *Canon* was held at Edinburgh, and the published papers contain some valuable information as to the works of Napier.

NAPIER, ROBERT (1791-1876). A British marine engineer, born at Dumbarton, Scotland. He was for a time apprenticed to his father, a blacksmith, and afterward went to Glasgow, where in 1815, after working for Robert Stevenson (q.v.), he set up a smithy, with two apprentices. In 1823 he built his first marine engine. In 1830 he supplied engines for the Glasgow Steam Packet Company, and 10 years later he supplied the Cunard Company with engines for their first four steamers. His first negotiations were with Samuel Cunard only, but as the latter could not meet the expense necessary to build engines large enough, that fact led to the seeking of additional funds and thence to the origin of the Cunard Company. Napier added shipbuilding to the construction of engines in 1841. He built the *Persia* for the Cunard Company in 1854, the *Black Prince*, one of the two earliest ironclad warships, for the British government in 1860, and afterward over 300 vessels, some of them warships for the British and other European governments.

NAPIER, ROBERT CORNELIS, LORD NAPIER OF MAGDALA (1810-90). A British soldier, born at Colombo, Ceylon. He studied at the East India Company's military college at Addiscombe and at the royal engineering school at Chatham, and from 1828 to 1845 was chiefly employed on the public works. In the latter year, however, he participated in several battles of the First Sikh War. During the Second Sikh War (1848-49) he again saw active service, and at its close was appointed civil engineer to the Board of Administration of the Punjab, in which capacity he inaugurated and partly carried out a comprehensive scheme of public improvements. During the summer and fall of 1857, at the time of the Mutiny, Napier distinguished himself in the movements which resulted in the relief of Lucknow. Later he also planned the recapture of that place. In June, 1858, he cooperated with Sir Hugh Rose in the latter's operations against the insurgent forces under Tantia Topi and the Ranees of Jhansi; and on the 29th, after Sir Hugh's departure, he took the chief command in Central India. In August he cooperated with Brigadier General Smith in the capture of Paori; in December, with slight loss to himself, destroyed Ferozeshah's army, and in April, 1859, captured Rajah Man Singh of Narwar and Tantia Topi. Subsequently he was appointed military member of the council of the Governor-General and aided in the amalgamation of the national army and that of the East India Company. He was given a divisional command in the expedition to China in 1860, in which the French took part. He participated in the assault upon the Peiho forts, dismantled them, entered Peking, and returned to India the same year. Lord Elgin's (q.v.) sudden death left him acting Governor-General for a short time. In 1868 he commanded the English expedition sent to Abyssinia and his troops, after a difficult march of over 400 miles, stormed the royal stronghold of Magdala. On his arrival in Eng-

land Queen Victoria created him Baron of Magdala. The next year he was appointed commander in chief in India. Six years later he returned to Europe and in 1883 was raised to the rank of field marshal. Consult C. R. Markham, *History of the Abyssinian Expedition* (London, 1869), and H. Escott, *Pillars of the Empire* (ib., 1879).

NAPIER, SIR WILLIAM FRANCIS PATRICK (1785–1860). A British general and historian, born at Celbridge, Kildare, Ireland. He was a brother of Sir Charles James Napier, the conqueror of Sind, and a cousin of Sir Charles Napier, the English admiral. Entering the army as ensign in the Royal Irish Artillery (1800), he became captain of a regiment in Sir John Moore's brigade (1804); took part in the siege of Copenhagen (1807); went with his regiment to Spain (1808); and for his bravery in the Peninsular campaigns was appointed lieutenant colonel (1813). Later he became colonel (1830), then Lieutenant Governor of Guernsey (1842), and general (1859). He was knighted in 1848. Napier passed his last years at Scinde House, Clapham. He gained an immense reputation by his *History of the Peninsular War* (6 vols., 1828–40). This work, which aimed to tell the truth, led to a long controversy with the officers who had taken part in the campaigns. It is, however, believed to be an impartial statement of facts. His *History of Sir Charles Napier's Administration of Scinde* (1851) is written in his boldest style. Consult the *Life* by Lord Aberdare (London, 1864).

NAPIER'S RODS, or BONES. See CALCULATING MACHINES.

NAPLES (It. *Napoli*; anciently, *Neapolis*). The largest city and seaport of Italy, capital of the Province of Naples, formerly the capital of the Kingdom of the Two Sicilies, situated on the west coast of the peninsula, at the foot of encircling hills, on the north side of the Bay of Naples, in lat. 40° 52' N. and long. 14° 15' E (Map. Italy, E 4). It is about 5 miles long and 3 miles broad. The climate is mild, although the variations in temperature and humidity, owing to alternating winds from the north and south, are often great and sudden. The thermometer ranges from 26° F. in January to 97° in July, the average winter temperature being 50°, the average summer temperature 75°. Fogs are rare and snow seldom falls. The rainy season lasts from the end of January to the beginning of April. The heat of summer is tempered by the sea wind that blows until about two o'clock in the afternoon. Vesuvius acts as a great natural barometer: when its smoke blows towards Capri, fair weather is always expected.

The far-famed situation of the city on the sea, amid its amphitheatre of hills, can be compared perhaps only with that of Constantinople. Across the bay to the south is visible the historic island of Capri; on the eastern shore are villas, vineyards, and orange groves grouped around tiny cities; while over all towers Vesuvius with ominous grandeur. The environs in general are unsurpassed for loveliness and the great variety of interest they present. Sorrento, Capri, Ischia, and the Phlegrean district are localities that delight the sightseer. Other striking attractions are the former monastery of the Camaldolites and the hill of Posilipo with its many associations and its fine streets offering magnificent views.

Architecturally Naples is by contrast surprisingly poor. The ancient and commercial part of the city lies east of a line drawn from Capodimonte through Sant' Elmo to Castell dell' Ovo, and is divided from north to south by the Via Roma.

The modern and western part, where are nearly all the principal hotels, is bordered on the south by the famous Riviera di Chiaia along the bay in a curved course of 3 miles. Here the Villa Nazionale stretches away—a splendid park dating from 1780 and extended in 1807, 1834 and subsequently. It is embellished with lordly allées, statues, and miniature temples. It contains the well-known aquarium of Naples, which exhibits a great variety of extraordinary fish being, in fact, a school established for the scientific investigation of the aquatic fauna and flora of the Mediterranean. The public squares of Naples are adorned with fountains and obelisks, and within the precincts of the city are several highly prized springs of fresh mineral waters.

The handsome Renaissance Porta Capuana is justly celebrated. The castles are numerous. Among the principal ones are the Castello Nuovo (dating from 1283 and renovated in 1905), called the Bastille of Naples, somewhat similar to the Tower of London, and adorned with a fine triumphal arch erected (1470) in honor of Alfonso of Aragon; the Castello Sant Elmo (1535), commanding a magnificent view from the ramparts, and the historic egg-shaped Castello dell' Ovo. The last (begun in 1154) is situated on an islet connected with the main land and is one of the conspicuous features. Near it is the street Santa Lucia—the centre of the noisy Neapolitan life, particularly of the lower classes. Women engaged in domestic duties, naked children, and peddlers of all sorts present a unique spectacle here in a city characterized by festivals and processions and bustling traffic. The neighboring royal palace (begun in 1600) is an enormous edifice. It has an imposing façade decorated (1885) with rich statues. The interior is uninteresting.

Of the nearly 300 churches none is very striking. The cathedral, a Gothic edifice, built in 1272–1323 but repeatedly modernized, is dedicated to St. Januarius, and contains the celebrated vials in which the liquefaction of the saint's blood is alleged to take place on three annual festivals. The church also contains the tombs of Charles of Anjou and Pope Innocent IV, besides numerous fine paintings and statues. San Martino (fourteenth century) is an interesting Gothic church, with its belvedere cloisters, and museum. In the monastery attached to the church of Santi Severino e Sossio are deposited the valuable archives of the former Neapolitan kingdom, consisting of some 40,000 manuscripts, the earliest dating from 703.

Naples is far richer in archaeological than in architectural interest. The Museo Nazionale (built in 1586 as cavalry barracks, seat of the university from 1616 to 1780, and devoted to its present purpose since 1790) contains an immense and unsurpassed collection of frescoes, paintings, mosaics, sculptures, antiquities, coins, medals, and inscriptions, including objects excavated at Herculaneum and Pompeii. Among its rarest, most celebrated possessions are the Farnese Bull, the Farnese Hercules, the Mosaic of the Battle of Alexander, the Pompeian fres-

NAPLES

VIEW OF THE CITY FROM THE TOMB OF VERGIL (UPPER)
PIAZZA DEL MUNICIPIO (LOWER)

coes, and a valuable collection of bronzes and vases. The splendid Galleria Umberto Primo was completed in 1890 at great expense.

At the head of the educational system is the university. (See NAPLES, UNIVERSITY OF.) There are also an engineering school, an Oriental institute, an astronomical observatory, a botanical garden, several unions for the study and diffusion of many branches of knowledge, a marine school, and a royal conservatory of music. The charitable institutions are numerous, on an extensive scale, and richly endowed. Besides that of the university there is the National Library, with 395,439 volumes, 221,859 pamphlets, and 7997 manuscripts in 1913. Naples has many good playhouses. The San Carlos is one of the largest and most famous of opera houses. The marionette theatres and the theatres where the famous Neapolitan Pulcinella is to be seen are a never-failing source of entertainment.

Naples is one of the most important manufacturing centres in Italy. Ships, locomotives and cars, and stationary engines are built, and glass, cotton, wool, gloves, perfumery, linen and silk products are manufactured. The extensive steel works are chiefly in the hands of English firms. Copies of ancient vases and bronzes, lava articles, and coral and tortoise-shell goods are largely dealt in. The commerce of Naples is more important than its industries. It has communication by steamers with nearly all parts of the world. The harbor has been improved in the last decade, and Naples has surpassed Genoa in the amount of tonnage entered and cleared. In 1911 there were entered 9468 vessels, of 8,260,294 tons, and cleared 9462, of 8,273,378 tons; total movement, 16,533,672, as compared with 10,145,000 in 1904 and 6,293,000 in 1898. The chief articles of import are coal, iron, and steel (Great Britain, Germany, and Belgium), grain (Russia and India), lumber (Austria-Hungary), cotton (United States and India), wool, leather, oils, and wines (France), and chemicals (Germany and Great Britain). The leading exports are wine and brandy, dried and subtropical fruits, nuts, paper, and hemp. The number of emigrants leaving the port of Naples in 1907 was 220,109, in 1908, 51,191; in 1909, 184,433, in 1910, 161,868, in 1911, 115,006; in 1912, 144,033.

Naples has been called the most densely populated city of Europe; in modern times its inhabitants have increased at a remarkable rate. Half of the population, including the countless *lazzaroni* and *trovatori*, were huddled together in the slums in ancient unsanitary buildings that crowded narrow, crooked streets, until the cholera epidemic of 1884 aroused the whole country. In 1885 the Italian Parliament voted about \$20,000,000 towards a systematic renovation which, when entirely completed, was to cost city and nation a far greater sum. A new water supply was introduced from the mountains near Avellino, 50 miles away, and plans were elaborated for a new sewer system, for new streets, new squares, and new buildings. Of 271 old streets 144 were to be abolished and 127 widened; the habitations of 90,000 people were to be destroyed, and the density of the population reduced from 645 to 280 per acre. Prior to the destruction of the slum dwellings a large working-class quarter was erected in the northern part of the city. Gradually the miserable conditions formerly obtaining have vanished. The widening of streets has permitted the introduc-

tion of numerous electric tramways. In 1901 the population of the city was 490,183; the commune had 563,540 inhabitants in that year, and, in 1910, 678,031.

For the history of Naples see TWO SICILIES, KINGDOM OF THE.

NAPLES, BAY OF. A bay of the Mediterranean Sea on the southwest coast of Italy (Map: Italy, E 4). It is 20 miles wide from Cape Miseno on the northwest to Point Campanella on the southeast and extends inward about 10 miles. The bay is famous for its beautiful scenery, the view including the city of Naples, Castellamare, and the other towns and villages along the shores, dominated by Mount Vesuvius on the east, while at the entrance to the bay are the lovely islands of Ischia and Capri. The bay offers good anchorage in 7 fathoms of water and is well sheltered except from winds in the southern quarter.

NAPLES, KINGDOM OF. See TWO SICILIES, KINGDOM OF THE.

NAPLES, UNIVERSITY OF. An Italian university, founded in 1224 by the Emperor Frederick II. It was reformed or reconstructed at least three times before 1266, when Charles I of Anjou finally placed it on a sound footing. Among its earliest and most brilliant scholars was Thomas Aquinas, who lectured here during its short but brilliant revival about 1272-74. It was reorganized in 1780, and since the incorporation of Naples with Italy, 1860, it has increased remarkably in numbers and influence. Its faculties are law, medicine, and surgery, physical sciences, philosophy, and letters; and the school of pharmacy. It had in 1913 a budget of nearly 930,000 lire and more than 6600 students, chiefly in law and medicine. Its library contains 353,620 volumes, 58,671 pamphlets, and a large number of incunabula and specimens of Aldines and other famous early books.

NAPO, nã'pô. A tributary of the upper Amazon. It rises on the slope of Mount Cotopaxi in Ecuador and flows southeast, emptying into the Amazon about 50 miles below Iquitos, after a course of 750 miles. For much of its course it forms the provisional boundary of Ecuador on the northeast. In its upper course it flows in a steep incline through a rough and rocky valley, but after emerging from the mountains it

traverses a vast forest-covered plain, almost unexplored, and sparsely inhabited by savages. The Napo is navigable for steamers for nearly 400 miles, but the natural wealth of the region, including gold, sarsaparilla, and rubber, is but little exploited.

NAPOLEON. A village and the county seat of Henry Co., Ohio, 36 miles southwest of Toledo, on the Maumee River, the Miami and Erie Canal, and the Wabash and the Detroit, Toledo, and Ironton railroads (Map: Ohio, B 3). Its manufactures are important, consisting of windmills, tanks, threshing machinery, separators, flour, etc. Napoleon contains a Carnegie library. The water works and electric-light plant are owned by the municipality. Pop., 1900, 3639; 1910, 4007.

NAPOLEON I, *Fr. pron. na'pô'lâ'ôn'* (NAPOLEON BONAPARTE) (1769-1821). Emperor of the French, born at Ajaccio, on the island of Corsica, Aug. 15, 1769. The family of Buonaparte (as the name was spelled until 1796) was of Tuscan origin, but had been settled in Corsica since 1529. The parents of the future Emperor were Carlo Maria de Buonaparte and Letizia Ramolino, a descendant of a good Florentine family. Napoleon was the fourth child and the second son. After a few months spent in learning French in a school at Autun, he entered the military school at Brienne on April 23, 1779, and there remained until he was transferred to the great military school in Paris in September, 1784. Just a year later he received his commission as second lieutenant in La Fère Regiment of Artillery, which was stationed at Valence. He served with this regiment until 1791, but passed the greater part of his time (1786-88 and 1789-91) on furlough in Corsica, where he took part in the patriotic movement under Paoli. He was in Paris during the events of Aug. 10, 1792, when the mob of Paris attacked the Tuileries, and on August 30 attained the rank of captain in the army. He returned to Corsica, but this time he had a falling out with Paoli and identified himself with the French Revolutionary party on the island. The defeat of this party compelled Napoleon and the other members of his family to escape and take refuge in France in June, 1793. As yet Napoleon had shown little indication of his genius and of the mighty career he was destined to lead. He had mastered his profession of arms, had shown a capacity for intrigue, and had learned to rely upon himself. In his long leisure hours he had devoted himself faithfully to books of a solid character. He was in the beginning an enthusiastic admirer of Rousseau, and his earliest writings, which date from the Valence period, reveal a depth of sentiment difficult to reconcile with his later career. Buonaparte rejoined his regiment in southern France, participated in the occupation of Marseilles by the Revolutionary forces, and then marched to Toulon to take part in the siege of that town. As *chef de bataillon* in the Second Regiment of Artillery he was practically in charge of the artillery during the siege operations, and won for himself golden opinions from the commissioners of the Convention with the army. One of these commissioners was Robespierre's younger brother, Augustin, whose intimate friend and confidant Buonaparte now became. His conduct at Toulon won him promotion to the rank of general of brigade, but his relations with the younger Robespierre and his outspoken Jacobinism caused his imprisonment

after the coup of the 9th Thermidor. An old Corsican acquaintance, Sieot, was one of the commissioners of the Convention in the south of France at this moment and intervened on behalf of the young artillery officer. Marmont, who was in position to help Buonaparte at this time, said that he did so because he saw "there was so much future in his mind." He was released on Aug. 20, 1794, and after further misfortunes he turned up in Paris, where he found temporary employment in the topographical bureau.

The Convention was now drawing to a close, but was forced to face one more insurrection, one antagonistic to the new constitution of the Year III. (See FRENCH REVOLUTION.) The work of defending the Convention was intrusted to Barras (q.v.), who selected as his second in command Buonaparte, whom he had seen at Toulon, and whom he now found in Paris half fed and shabbily clothed, awaiting the next turn of the wheel of fortune. "From the first," says Thiebault, "his activity was astonishing, he seemed to be everywhere at once; he surprised people by his laconic, clear, and prompt orders. everybody was struck by the vigor of his arrangements, and passed from admiration to confidence, and from confidence to enthusiasm." With the "whiff of grape shot" he swept the Parisian mob from the streets on the 13th Vendémiaire (Oct. 5, 1795). The Convention came to an end, the Directory took its place with Barras as one of the Directors, and Buonaparte succeeded Barras as commander of the Army of the Interior. Barras welcomed the young hero of the hour to his salon, where the grace of person and charm of manner of a young Creole widow, Josephine de Beauharnais, aroused in Buonaparte passionate admiration and love. Despite a disparity of six years in their ages, the influence of Barras brought about a marriage on March 9, 1796. Meanwhile the favor of another Director had brought to Buonaparte a much more important command in the army. Buonaparte had visited the Genoese Riviera in 1794, and at the Topographical Bureau he had taken the opportunity to prepare a plan of campaign in northern Italy, which he now perfected and presented to Carnot (q.v.), who admired it and ordered its execution. Schérer, the general of the Army of Italy, replied that if the Directors wanted the plan carried out they should send down the man who devised it to do it. He was taken at his word; Buonaparte was appointed to the command, and left Paris two days after his marriage, arriving at Nice in March, 1796.

At this moment, after the treaties of Basel, France was still at war with England, Austria, and Sardinia. England was no longer a factor in the military situation on the Continent; Austria had been attacked only in southern Germany, while on the Italian frontier France had done nothing except to make intermittent attacks on Sardinian territory. Italy was made up of patches of Austrian territory and of petty states under Austrian influence, which offered a rich spoil for the conqueror. The main body of the Austro-Sardinian army was at Montenotte, occupying the pass between the Maritime Alps and the Apennines at the headwaters of the Bormida and the Tanaro, two affluents of the Po. One road followed the latter northwest to Turin, the other road followed the Bormida to the northeast to Milan; between the two was an almost im-

NAPOLEON I.
FROM AN ENGRAVING OF A PORTRAIT BY DAVID

passable mountain country. A successful blow would compel the Sardinians to retreat on their capital, Turin, and the Austrians on Milan, their headquarters in Italy, without hope of reuniting their forces. This army of 52,000 men was somewhat scattered and could not be used in full force at any one point, and many of the men were sick. The French Army of Italy was no better off. There were 42,000 poorly equipped, worse clad, and unpaid men scattered in detachments along the Riviera from Nice to Savona. Their new commander, Buonaparte, was a slender, delicate-looking youth of 26, who was known only for some skill shown in handling artillery at Toulon and in Paris. Rumor said he owed his appointment to a discreditable intrigue between Josephine and Barras. Certainly there was little to promise one of the greatest military campaigns in all history, the most dazzling success of modern times. Buonaparte (as he now spelled his name) from the moment of his arrival took hold of things with the grasp of an experienced general skilled in the management of men. His address to his army kindled their imagination: "Soldiers, you are half-starved and half-naked, the government owes you much, but can do nothing for you. I am about to lead you into the most fertile valleys of the world, there you will find flourishing cities and teeming provinces, there you will reap honor, glory, and riches: Soldiers of the Army of Italy, will you lack courage?" Reinforcements arrived which raised the army to about 50,000 men, whom Buonaparte concentrated at Savona. The campaign opened at Montenotte on April 11. Three successive attacks compelled the Sardinians under Colli to retreat towards Turin, while the Austrian commander, Beaulieu, fell back towards Milan. Buonaparte pressed on against Colli, and, though he had no power to negotiate, compelled him to sign the armistice of Cherasco (April 28), which gave France military control of Piedmont and left Buonaparte free to attack Beaulieu. From this moment Buonaparte showed the Directory that they had no ordinary general to deal with. He did not wait for orders. He did things and then reported, he preferred no requests, but presented demands coupled with an ultimatum. Immediately after the signature of the armistice with Colli, Buonaparte reassembled his forces, which had scattered to forage and plunder, and prepared to attack Beaulieu, who had retreated across the Po and the Ticino. Beaulieu expected Buonaparte's attack near Pavia. The French commander turned his flank, seized Piacenza on May 7, and compelled Beaulieu to retreat across the Adda, leaving Milan to the French. Buonaparte pursued the retreating Austrians and defeated them at the bridge of Lodi, across the Adda, on May 10. After this battle it is said the troops gave Buonaparte the endearing name of the Little Corporal. Buonaparte promptly occupied Milan and there displayed his characteristic qualities. He appealed to the popular enthusiasm, and led the Milanese to believe that he was their deliverer. He established a temporary administration, welcomed artists and writers, and showed an interest in the University of Pavia. On the other hand, he extorted a war contribution of 20,000,000 francs and seized and sent to Paris numerous literary and art treasures. The young general did not dally. In a few days he was again pushing on against the Austrians, and on June 3 the siege of Mantua

was begun. This strongly fortified town was the key to northern Italy. While the siege was in progress Buonaparte paid his respects to the dukes of Modena and Parma, to the Grand Duke of Tuscany, and to the Pope, each of whom he compelled to buy peace with large sums of money and with treasures of art and literature. The Austrians raised army after army for the relief of Mantua, but in vain. The first, under Wurmser, advanced from Tirol in three divisions, and compelled the raising of the siege of Mantua by Buonaparte, who marched to meet the Austrians and defeated them at Castiglione on August 5. Wurmser made a second attempt by the valley of the Brenta, but was defeated at Bassano on September 8, and driven into Mantua, the siege of which was resumed by the French. Alvinczy, by the way of the Brenta, and Davidovich, by the way of the Adige, brought the second Austrian army into Italy, planning to concentrate 60,000 men at Verona. Buonaparte had to meet them with about 40,000, and at Caldiera, on November 12, he met a severe check; but, driven to desperation, he put forth superhuman efforts, and after three days of fighting defeated the Austrians at the bridge of Arcole (q.v.) and forced them to retreat. Alvinczy, from the wreck of his army and with reinforcements, created the third Austrian army and advanced southward between Lake Garda and the Adige. Buonaparte hastened to meet him, seized the important strategic position at Rivoli, repulsed Alvinczy on Jan 14, 1797, and hurled him back into Tirol. Turning back on Mantua, Buonaparte captured at La Favorita two days later an important detachment of Alvinczy's force which by a flank movement had almost succeeded in reaching Mantua. Wurmser surrendered Mantua on February 2. In this famous campaign of 1796 Buonaparte relied on three important maxims to which he held fast throughout his career: divide for foraging, concentrate for fighting; unity of command is essential for success; and time is everything. Quickness to divine his enemy's plans, a thorough knowledge of geography which produced combinations that were executed with bewildering audacity, an ability to get a maximum amount of marching and fighting out of an army of young veterans who were poorly shod and clad and ill fed, and the loyal support of his subordinates, Augereau, Masséna, Joubert, Lannes, Marmont, Victor, Murat, and Junot, combined to enable Buonaparte to conquer northern Italy for France. The campaign of 1797 was an act of colossal audacity. With less than 50,000 men Buonaparte drove the Archduke Charles and the Austrians from Italy, forced the passes of the Alps in March, and pressed on directly for Vienna without waiting for Moreau (q.v.) to cooperate. At Leoben, within 100 miles of Vienna, he signed preliminaries of peace with Austria on April 18.

Bonaparte the conqueror began to take wider views of the part he was to play, and played it with a boldness and a skill that dazzled France into complacency. He organized the Italian conquests into the Cisalpine Republic and constituted the Genoese dominions into the Ligurian Republic; he sent Augereau as his secret agent to conduct the military operations of the coup d'état of the 18th Fructidor (see FRENCH REVOLUTION): he lived and acted like a monarch in northern Italy; and finally, disregarding the express orders of the Directors, he negotiated with

Austria the Treaty of Campo Formio (Oct. 17, 1797). Austria gave up her former Belgian possessions and Lombardy, and received most of the territories of the extinguished Republic of Venice. Bonaparte now returned to France, but the Directors were afraid of him and sought to rid themselves of him by dispatching him on some out-of-the-way or hazardous enterprise. It was evident to him that a direct attack upon France's one remaining foe, England, could not succeed, and he suggested instead the campaign in Egypt. The Oriental dream was always before his eyes, and throughout life influenced his policy. He saw in India the source of England's power, and he determined to attack India. He negotiated with Tipu Sultan, a determined foe of the English, and, as the easiest route to India was by the Red Sea, he proposed to conquer Egypt as a stepping-stone to India. An expedition was fitted out with the utmost secrecy at Toulon, and on May 19, 1798, he set sail with a large fleet carrying 35,000 men. He stopped on the way to capture Malta. On July 1 he landed in Egypt and occupied Alexandria on the next day. Advancing into the desert, he encountered and defeated the famous Mameluke cavalry in the battle of the Pyramids on July 21, and three days later entered Cairo. Desaix was detached to conquer Upper Egypt, and Bonaparte devoted himself to consolidate his conquests. On August 1-2, however, Nelson destroyed his fleet in Abukir Bay, and Turkey declared war and planned to recover Egypt. Taking the offensive at the beginning of 1799, Bonaparte invaded Syria, captured Jaffa, and laid siege to Acre. Junot fought an engagement with the Turks near Nazareth, and Kléber found himself attacked by 30,000 of them at the foot of Mount Tabor on April 15, but was rescued by the opportune arrival of Bonaparte. Returning to Acre, Bonaparte found that he was unable to take the place by storm, and having lost 5000 men in fighting or from the plague, he ordered a retreat. Arriving in Egypt, he met another Turkish force, which had landed near Alexandria, and defeated it on July 25. News from France told of the infidelity of Josephine and of the evil plight of France under the decadent Directory, which was being attacked by the newly formed Second Coalition of the Powers of Europe against France. On the night of August 22-23, leaving Kléber in command, Bonaparte escaped from Alexandria and, evading the English ships, landed at Fréjus on Oct. 9, 1799.

On reaching Paris he speedily took counsel with the members of his family and after a scene with Josephine forgave her, though he did not forget her offense. Councils with Talleyrand, Sieyès, and other important men of affairs followed, but most of all with his brother Lucien, who was now President of the Council of Five Hundred. Plans were speedily devised, and on Nov. 9, 1799, the famous coup d'état of the 18th Brumaire took place. The Directory was overthrown, the Council of Five Hundred dispersed by soldiers, and a provisional government composed of Bonaparte and two of the late Directors, Sieyès and Roger Ducos, installed. Sieyès (q.v.) expected to be the managing head of the new combination, but at the first meeting found that Bonaparte had everything in his own hands. In a few weeks the provisional government drew up and promulgated the constitution of the Year VIII, which

provided for four assemblies—one to propose laws, one to consider them, one to vote upon them, and one to decide upon their constitutionality—but in spite of this elaborate machinery left practically all the power in the hands of Bonaparte, who became First Consul (Dec. 24, 1799). Bonaparte devoted his attention to centralizing the government. Local initiative was carefully limited so that everything might be controlled from Paris. Prefects were installed in all the departments and subprefects in the minor divisions. This centralized bureaucracy, modeled after the traditions of the French monarchy, has survived to the present day. The new constitution when completed was ostensibly submitted to the people for their approval by means of a plébiscite, which resulted in favor of the constitution by a vote of 3,000,000 to 1562. Having arranged the more important details of the administration and restored internal peace by the pacification of the Vendée, he turned his attention to the military situation. The victory of Masséna at Zurich on Sept. 25-26, 1799, had freed France from the danger of invasion by the Second Coalition, but Italy and southern Germany were once more in the hands of the Austrians, and Masséna with a French army was shut up in Genoa. Bonaparte suddenly and with the utmost secrecy gathered a new army for the invasion of Italy. Instead of taking the expected course of advancing along the Riviera as in 1796 and raising the siege of Genoa, he took his army, whose existence was unknown to the Austrians, across the Great St. Bernard Pass and occupied Milan on June 2, 1800. The surprised Austrian General Melas endeavored to gather his forces and save himself. A detachment under Lannes defeated an Austrian detachment at Montebello on June 9, but on the 14th Bonaparte found himself forced to face the main Austrian army of 31,000 men at Marengo with only 18,000, and with difficulty saved himself from complete defeat. The opportune arrival of Desaix after the battle was really over led to a renewal of the fight, to the astonishment of the Austrians, who were driven from the field. The campaign of Marengo was a masterpiece, but the honors of the victory itself belong to Desaix, who bought it with his life, and to Lannes, Bessières, and the younger Kellermann. Melas evacuated all of Italy west of Mantua, but Austria was not ready to make peace until she had been defeated by Moreau at Hohenlinden (q.v.) on December 3 and MacDonald had crossed the Splügen and threatened Vienna. Negotiations were then opened between Cobenzl and Joseph Bonaparte, and on Feb. 9, 1801, the Treaty of Lunéville was signed. England was now the only remaining foe of France. England forced the French to evacuate Egypt and captured Malta, while Bonaparte forced Naples and Portugal to abandon the English alliance. The faint-hearted Addington ministry in England signed preliminaries of peace with France on Oct. 1, 1801, and on March 27, 1802, Cornwallis and Joseph Bonaparte signed the Treaty of Amiens, which gave France complete peace for the first time in 10 years. The diplomatic genius of Bonaparte shines brightly in these treaties, which enabled him to make real gains for France such as all the wars of Louis XIV had failed to obtain. He carefully hid many things in these treaties for future use, which enabled him to appear as the pacificator and reorganizer not only of France, but of

Europe, and as the founder of a great colonial empire. Seeds for future war were as carefully sown, which were to bring forth fruit at the appropriate season.

Bonaparte had shown himself the greatest master of the art of war and one of the shrewdest of diplomats, when at 30 years of age he undertook the duties of a ruler, lawgiver, and administrator. His greatness lay in the universality of his genius and in his inordinate capacity for hard work. Further, he was able to command the services of many men of extraordinary ability and to make their work his own. His reorganization of the government of France was accomplished in a few months and comprised enough achievements of the first order to have established the enduring fame of several statesmen. This tremendous activity so stirred and inspired his officials that they said "the gigantic entered into our very habits of thought." With Gaudin he reorganized the treasury department, regulated the assessment and collection of the taxes, and organized the Bank of France. With Chaptal he reorganized the local administration with the prefects and subprefects responsible to the central authority, the Council of State. The schism between the Catholic church and the constitutional clergy was healed and the Catholic church restored to its old-time place in France, by the negotiation of the Concordat (q.v.) with Pius VII in 1801. The Lutherans, the Calvinists, and ultimately even the Jews were brought into similarly close relations with the state. The educational system was reconstructed, especially in the matter of secondary schools and of technical education. The work was completed by the establishment in 1808 of the University of France, which comprised the whole teaching force of the Empire. The establishment of the Legion of Honor in May, 1802, provided a means of recognizing services to the state. The greatest triumph was the codification of the laws of France. See CODE NAPOLEON.

France had lost her colonial empire in the eighteenth century, and it was the fond hope of Bonaparte that he might restore it and thus rival England in commerce and upon the seas. To this end he began a series of enterprises which embraced every quarter of the globe—North and South America, Africa, India and the East, and Australia. He secured the cession of Louisiana from Spain, and sent an army to recover Haiti, where the blacks had successfully risen against their oppressors. In all these schemes he was checkmated by England, but on the continent of Europe he was hindered by nothing more serious than protests in reaping the fruit of the wars of the French Revolution. He reconstituted upon the new French lines the Batavian Republic, the Cisalpine Republic (which became the Italian Republic), and the Ligurian Republic (1801-02). He extended the bounds of France, which already had the Rhine, the Pyrenees, and the Alps as her frontiers, by the annexation of Piedmont and Parma in 1802. He was actively concerned in the reorganization of Switzerland and of Germany in 1803. The Treaty of Aranjuez (March 21, 1801) bound Spain to France, while Portugal, the faithful ally of England, was humbled by the Treaty of Badajoz (Sept. 29, 1801).

Bonaparte's colonial schemes were frustrated by yellow fever, which destroyed General Leclerc and his army in Haiti and forced the Consul to sacrifice Louisiana to the United States (1803)

and abandon his dream of empire beyond the seas. Pique at this disappointment hastened Bonaparte into the predetermined rupture with England. A *casus belli* was found in the question of Malta, which England refused to surrender in accordance with the terms of the Treaty of Amiens. Mortier occupied Hanover, of which George III was King. Gen. Gouvion Saint-Cyr was ordered to occupy the Kingdom of Naples, an ally of England, to offset the occupation of Malta. The French army was mobilized in six divisions and stationed along the Channel from Ostend to Brest. War existed from May 16, 1803, but actual hostilities did not begin until over two years later. In the meantime England recalled Pitt to office (May, 1804). Pitt's great service consisted in securing allies and in forming the Third Coalition against France. In this work he was aided by Bonaparte's blunders, the most notable of which was the execution of the Duc d'Enghien (March 21, 1804), in retaliation for the Royalist plots of Pichegru and Georges Cadoudal. On the day of Pitt's return to power Bonaparte was offered the title of Emperor by the French Senate, and on Dec. 2, 1804, he was crowned Emperor as Napoleon I at Paris in the presence of Pope Pius VII. On May 26, 1805, he was crowned at Milan King of Italy. A few days later followed the last of his series of aggressions, which provoked Austria and Russia into the alliance with England, the annexation to France of the Ligurian Republic (June 4). A month later Russia and England signed their alliance against Napoleon, and on August 9 they were secretly joined by Austria, Sweden, Portugal, and Naples were practically, though not formally, parties to this coalition.

For two years Napoleon had been dallying with a scheme for the invasion of England. In the camps along the Channel he had organized, equipped, and drilled his famous Grand Army, composed largely of veterans of the wars of the Revolution, and at Boulogne special preparations had long been under way for an attack upon England. The summer of 1805 seemed the propitious time for the attack, and Napoleon made elaborate dispositions for obtaining naval control of the Channel and for the transportation of an army of 160,000 men from Boulogne to the Kentish coast. The French fleet under Villeneuve, however, was outmaneuvered and outfought by the English under Cornwallis, Calder, and Nelson. By the middle of August, 1805, the scheme had become impossible of execution. Napoleon, however, had foreseen this possibility, his other acts had already provided him with another chance to employ his army, and he had worked out in his mind the plan of his most brilliantly successful campaign, that of Austerlitz. On August 29 the Army of England was officially denominated the Grand Army and divided into seven corps under Bernadotte, Marmont, Davout, Soult, Lannes, Ney, and Augereau, with the cavalry under Murat and the Imperial Guard under Bessières, in all about 220,000 men under the personal command of the Emperor, with Berthier as chief of staff. War was declared against Austria on September 25, and the next day the movement of the Grand Army into southern Germany began. On the part of Austria the Archduke Charles, with over 90,000 men, the best general and the largest army, was intrusted with operations in Italy, where 50,000 French troops were under

the command of Masséna, while the smaller Austrian army, under the command of the Archduke Ferdinand and General Mack, invaded Bavaria and occupied the untenable line of the Danube and the Iller with headquarters at Ulm. This move left Austria almost bare of troops. Making a feint at repeating Moreau's tactics of 1796 in attempting to turn Mack's left, Napoleon ordered the actual attack to be made on the right. Bernadotte and Marmont occupied Munich, Davout and Soult seized Augsburg, while Ney and Lannes occupied Gunzburg and operated to the north of Ulm. Mack made three fruitless attempts to extricate himself, but after defeats at Wertingen, Memmingen, and Elchingen (October 14), he was forced to capitulate with 33,000 men on October 20. Though the Archduke Ferdinand escaped, Napoleon's forces were thus able to advance directly to Vienna, which he occupied on November 13. The Russian forces which had been advancing to support Mack were forced to fall back into Bohemia, where the various divisions were united under the command of Kutusoff and joined by part of the Austrian forces. Napoleon marched northward to meet them, and on December 2 won his greatest victory, Austerlitz. The campaign of Ulm and Austerlitz was won by Napoleon's knowledge of the value of time, the whirlwind rapidity of his movements, and the precision of his combinations. The battle of Austerlitz was won by a masterly use of artillery. The vanquished Emperor Francis I of Austria humbled himself before Napoleon in the Treaty of Pressburg (December 26) and consented to large cessions of territory, including the former Venetian dominions, Tirol (given to Bavaria), etc. The overthrow of Austria resulted in the formal dissolution of the old Holy Roman Empire (Aug. 6, 1806).

What Austerlitz was for Napoleon on land, Trafalgar was for England on the sea. After a brief rest at home, Nelson had been ordered out to attack Villeneuve, who with the combined French and Spanish fleets sailed out of Cadiz and met Nelson off Cape Trafalgar. England's greatest sea fighter won the greatest naval battle of the century, but lost his life (Oct. 21, 1805). After this the French were able to do nothing at sea, and the ports of both France and her allies were generally blockaded by the English fleets. England was undisputed mistress of the seas, while Napoleon began to remake the map of Europe as though he were the undisputed master of the Continent. The most important changes during the year 1806 were the formation under his protection of the Confederation of the Rhine, the establishment of his brother Joseph as King of Naples and of his brother Louis as King of Holland, and the creation of the Grand Duchy of Berg for his brother-in-law Murat. The death of Pitt (Jan. 23, 1806) led to negotiations between Napoleon and Fox, the new Foreign Secretary. These negotiations, as well as those with Russia, came to naught, and to Napoleon's surprise this failure was coupled with the decision on the part of Frederick William III of Prussia to make war upon him. Single-handed Prussia undertook to meet Napoleon, who, as soon as he foresaw that war was inevitable, acted with the same vigor as in the previous year. The Prussian army under Prince Hohenlohe-Ingelfingen and Charles William Ferdinand, Duke of Brunswick, was drawn out in a line 85 miles in length,

extending from Gera westward to the borders of Hesse-Cassel, with the bulk at Erfurt. Napoleon left Paris on September 25 and assumed charge of the campaign at Würzburg on October 2. On the 10th Prince Louis Ferdinand was defeated and slain in a skirmish at Saalfeld; on the 14th Napoleon surprised the Prussian army in its attempt to concentrate, and in person defeated Hohenlohe at Jena, while Davout defeated Brunswick at Auerstädt. Murat and Lannes pursued Hohenlohe and forced him to surrender at Prenzlau (October 28), while the other remnants of the Prussian army and the fortresses surrendered without a blow. Saxony, which had acted as the ally of Prussia, went over to Napoleon, and later received as reward the Duchy of Warsaw. From the Prussian capital Napoleon issued the Berlin Decree, which, with the Milan Decree of 1807 and other decrees, was directed against English commerce. See CONTINENTAL SYSTEM.

Prussia, though vanquished, continued weakly the struggle in her eastern provinces, where Bennigsen and the Russians were ready to join in the contest. Murat occupied Warsaw, then Prussian territory, in November, 1806. In December Napoleon entered the ancient Polish capital and was greeted as the restorer of Polish liberties. The French having gone into winter quarters, Bennigsen hoped to surprise them and destroy them before they could again take the field, and accordingly attacked Ney and Bernadotte, but their successful resistance defeated the plan and Napoleon in person pursued Bennigsen, who retreated toward Königsberg, and overtook him at Eylau (q.v.). The ensuing battle (Feb. 7-8, 1807) was a butchery, not a victory. Napoleon hurried up reinforcements to renew the struggle in the spring. Sebastiani, the French Ambassador at Constantinople, persuaded the Sultan to declare war against Russia. Gardane was sent to stir up Persia to like action. Mortier induced the Swedes to treat with France. The campaign for Königsberg began early in June and was marked by the indecisive action of Heilsberg (June 10) and the defeat, four days later, of the Russians under Bennigsen at Friedland (q.v.). On June 25 the Czar and Napoleon held their famous conference of Tilsit (q.v.) on a raft moored in the Niemen. By the Treaty of Tilsit Prussia was humbled even more than Austria had been at Pressburg, while the Czar became the ally of Napoleon and began to plan with him the division of the world between them.

Though England, under the Ministry of All the Talents, had behaved very badly towards Prussia and Russia, she remained the one steadfast foe of the French Emperor, and pursued without wavering her policy of opposition to Napoleon. At Tilsit Napoleon bound the Czar to enforce the Continental System against England, and then began the task of compelling all the lesser Powers to adhere to the system. There were to be no neutrals. Portugal, the constant ally of England, was the first victim. By the Treaty of Fontainebleau Napoleon joined with Spain to dismember that Kingdom, and in November, 1807, a French army under Junot occupied the country with little trouble, the royal family having already started for the New World to establish a temporary capital at Rio de Janeiro. The year 1808 witnessed the unfolding of Napoleon's designs against Spain. Gradually, in spite of all treaties, French

troops were sent across the Pyrenees, where they quietly took possession of various fortresses. Spain was suffering from the family troubles of the Bourbon monarch, and it suited Napoleon's purpose to make use of them and to order the advance of a French army under Murat towards Madrid. This movement precipitated the fall of the Bourbons. Charles IV was compelled by a popular uprising to abdicate in favor of his son, Ferdinand VII (March), and a little later father and son, at a meeting with Napoleon at Bayonne, were forced to renounce the Spanish throne. On June 6, 1808, Joseph Bonaparte was proclaimed King of Spain. For an account of the struggle in Spain and Portugal, see *PENINSULAR WAR*.

In Austria Francis I had called to office as his chief minister Count Philip Stadion, who, with the aid of Archduke Charles, devoted himself to the task of preparing Austria for another struggle with Napoleon. The misfortunes of Napoleon in Spain and the urgency of England, which offered liberal subsidies and active cooperation, determined the Austrians to try their fortunes once more in the spring of 1809. In April Archduke Charles opened the war by invading Bavaria, while another force under Archduke John invaded Italy. Napoleon reached the scene promptly and in the five days' fighting (April 19-23) around Ratisbon completely defeated the Austrian plan of campaign and forced Archduke Charles to retreat towards Vienna, which the victorious Emperor entered on May 13. He then crossed the Danube and attacked the Archduke, who had taken up strong positions in the villages of Aspern and Essling. Two days of hard fighting (May 21-22) failed to give Napoleon any decided advantage, and he found himself and his army practically prisoners on the island of Lobau in the Danube. With his accustomed vigor he ordered up reinforcements and reorganized the troops under him. On July 5 Napoleon left the island of Lobau and on the 6th defeated the Archduke Charles in a great battle at Wagram. On October 14 was signed the Treaty of Schonbrunn (qv), by which Austria was forced to make large cessions of territory to the overbearing conqueror. From 1809 to 1812 the main strength of the French Empire was devoted to continuing the struggle in the Peninsula. A number of isolated events in other parts of Europe, however, made the period important. In pursuance of the Treaty of Tilsit, the Czar robbed Sweden of Finland (1808), and in the same year the French seized Swedish Pomerania. The next year the Swedish Kingdom was the scene of a revolution. Gustavus IV was deposed and his uncle placed on the throne as Charles XIII. Marshal Bernadotte, the brother-in-law of Joseph Bonaparte, was elected heir to the childless monarchy and intrusted with the government of the Kingdom. (See *CHARLES XIV*.) Denmark had likewise been marked to suffer on behalf of Napoleon's Continental System; but in this instance he was forestalled by England, which seized the Danish fleet in September, 1807. After the Treaty of Tilsit a kingdom of Westphalia was carved out for Jerome Bonaparte in Germany, and numerous changes made in the Confederation of the Rhine. Napoleon enlarged his own Empire by the annexation of Tuscany (1807), the Papal States (1809), Holland (1810), Valais and the German coast line to Lübeck (1810). He also kept the Illyrian

provinces, which had been wrested from Austria, for himself. Naples was transferred to Murat after the choice of Joseph as King of Spain. Pope Pius VII, the same pontiff who had consecrated Napoleon as Emperor in 1804, was carried away as a prisoner and kept in confinement. The new Cæsar must have an heir to his Empire, and accordingly Josephine was divorced and a marriage arranged in 1810 with the Archduchess Maria Louisa of Austria, daughter of the Emperor Francis, who bore Napoleon one son, the King of Rome (1811). From Napoleon's policy England profited as much as did France, for the whole commerce of the seas was under her control and she had seized the colonies of France and all those of the countries under French control or influence that she saw fit. During the years from 1809 to 1815 England furnished the inspiration and the sinews of war for every campaign against Napoleon, but it was only in the Peninsula that she was directly responsible for the conduct of the campaign, which was carried on with desperation on both sides till the French were driven beyond the Pyrenees in 1814.

For three years after Wagram Napoleon did not in person conduct a single military operation. Family affairs and the administration of his great Empire occupied all his attention. During these years many changes were taking place which presaged the downfall of the great conqueror. Austria was very cautiously strengthening her position under the skillful direction of Metternich. The regeneration of Prussia under Stein, Scharnhorst, and Hardenberg is one of the most notable events of the nineteenth century. Russia was never content with the French alliance, the enforcement of the Continental System was causing great suffering and discontent, and the Czar Alexander was beginning to lose his enthusiastic admiration for Napoleon, who had offended him by concluding a matrimonial alliance with Austria without waiting for an answer to his request for the hand of a grand duchess in marriage and, most of all, by the annexation of Oldenburg to France. The estrangement was increased by the Cæsarism of Napoleon, who could no longer endure the existence of even a friendly rival. Alexander, duly warned of Napoleon's intentions, turned to England and in 1812 entered into a close alliance with her. With Turkey he negotiated the Peace of Bucharest (May 28), and with Sweden not only peace, but alliance (April 5). Napoleon left Paris early in May and went direct to Dresden, where he took care to bind Prussia, Austria, and the other German states more closely to his cause. Then he entered Poland, where he regulated the internal affairs and supervised the mobilization of his army. On June 22 he issued a declaration of war against Russia. The passage of the Niemen was begun on June 24, and by the end of the month Napoleon had 400,000 men across the Russian frontier. The Czar had between 250,000 and 300,000 men under arms, but only about one-half of this number ready to face Napoleon under Barclay de Tolly and Bagration, who conducted a Fabian campaign. Napoleon found the country devastated and abandoned as he advanced, with no enemy to make a stand against him. Like Charles XII, a century earlier, he was being lured to his ruin. At Smolensk (August 17-18) the French encountered the first serious resistance. Napoleon as he advanced had to

leave large bodies of troops along his line of march, and he detached a large force to the northward to capture Mitau and Riga and threaten St. Petersburg. Russian discontent became pronounced as the people saw Barclay de Tolly and Bagration permitting Napoleon to advance unresisted on their ancient capital, Moscow. The two generals allowed themselves to be superseded by Kutusoff, who chose his ground, and on September 7 offered battle to the French at Borodino (q.v.). It was the bloodiest battle of the century, the losses probably aggregating 40,000 on each side. The loss to Napoleon, who could obtain no reinforcements, was fatal, but still he pressed on and entered Moscow (September 14) only to find himself robbed of the fruit of victory by the terrible conflagration which broke out two days later. With a folly that seemed madness, Napoleon lingered in the city until October 19 before beginning the retreat. The hard-fought drawn battle of Malo-Yaroslavitz (October 24) compelled Napoleon to retreat by the same desert road on which he had advanced, instead of by a more southerly route through country not yet devastated by war. Sufferings from the cold and from lack of food were intensified by the constant presence of the Russians on the flanks and in the rear. The expected supplies were not found at Smolensk, and the sufferings of the French reached their terrible climax at the crossing of the Beresina (November 26-28), where thousands perished in spite of the heroic efforts of Oudinot and Ney. A week later Napoleon turned over the command to Muiat and hastened to reach Paris and organize a new army before the news of the great disaster should become known in western Europe. Ney, the bravest of the brave, in command of the rear guard, protected the retreat, but only 20,000 out of the 400,000 who had crossed the Niemen in June recrossed it in December. The disaster, however, was greater than the mere loss of an army of 400,000 men. Napoleon had lost his prestige, and henceforth Castlereagh, the English Foreign Minister, and the Czar Alexander supplanted Napoleon as controllers of the destinies of Europe. The Czar advanced into eastern Prussia, where he installed as Governor the ex-Minister Stein, who placed himself at the head of a great Prussian patriotic rising against Napoleon. Driven by this outburst of national spirit, Frederick William III signed an alliance with the Czar at Kalisz (Feb. 27, 1813). Austria, under Metternich, hesitated between Napoleon and Alexander and offered to mediate. Napoleon sent into Germany a new army made up of conscripts and of troops withdrawn from Spain, and on April 29, at Weimar, assumed the direction of the campaign of 1813, which he had decided to fight on the line of the Elbe, where Eugène de Beauharnais and Davout were struggling to check the Russians and repress the Prussians. Successes at Lützen and Gross-Görschen (May 2) on the great plain around Leipzig enabled Napoleon to occupy Dresden as his base of operations and to advance to Bautzen, where he defeated the allies on May 20-21.

Napoleon should have followed up this movement with vigor, but he hesitated because of the untrained condition of his army and of the attitude of Austria. Bernadotte, after the Treaty of Stockholm with England (March 3), had landed at Stralsund, prepared to take an active part in the overthrow of Napoleon, whom

he had learned to hate bitterly. Moreau, the only surviving French rival of Napoleon, was summoned from America to act as chief adviser of the allies. England signed new treaties with Prussia and Russia (June 14-15), and the Czar and Metternich signed at Reichenbach (June 27) a secret treaty, by which Austria bound herself to join the allies if Napoleon did not accept her proposals before the expiration of the truce on August 10. This was equivalent to a treaty of alliance, for it was certain that the Congress of Prague would accomplish nothing. On August 10 the Austrian army under Schwarzenberg began operations in Bohemia in concert with the allied army under Blücher in Silesia. The victory of Wellington at Vittoria (June 21, 1813) encouraged the allies and made a great victory an absolute necessity to Napoleon, who promptly took the offensive and attempted to force a battle with Blücher near Görlitz and crush him and then turn against Schwarzenberg. Blücher evaded battle, and Schwarzenberg advanced to attack Dresden. Napoleon reached Dresden just in time and on August 26-27 won his last great victory (See DRESDEN, BATTLE OF.) For the moment Dresden was saved, but the success was more than offset by the defeats inflicted upon his subordinates, Oudinot at Grossbeeren (August 23), Macdonald on the Katzbach (August 26), Vandamme at Kulm (August 29-30), and Ney at Dennewitz (September 6). The losses of Napoleon during the 10 days' campaign were almost overwhelming and irretrievable, while reinforcements speedily made good the losses of the allies. Napoleon failed to appreciate that the line of the Elbe had become untenable from the moment that Austria joined the allies, and instead of falling back of the Rhine and offering to negotiate, he continued to struggle to hold Dresden. Constant rains and bad roads had been an important factor in the August campaigns and prevented Napoleon, in spite of his boundless energy and activity, from accomplishing anything in September. This failure was fatal, for in October the allies, who had defined their relations in the Treaty of Toplitz (September 19), took the offensive and developed their campaign with such skill that Napoleon was completely deceived until they had nearly completed their dispositions. Blücher, unperceived, crept around Napoleon's left, got in touch with Bernadotte, and advanced towards Leipzig from the north, while Schwarzenberg was advancing from the south towards the same place. Napoleon left Gouvion Saint-Cyr to hold Dresden and hurriedly concentrated all available forces to protect Leipzig and hold his lines of communication. For three days (October 16, 18, and 19) "the Battle of the Nations" raged around Leipzig, and on the last day the French were driven out of Leipzig in a disastrous rout. (See LEIPZIG, BATTLES OF.) Napoleon retreated hastily behind the Rhine, stopping only to destroy, at Hanau (October 30), the army of Bavaria, which had recently joined the allies. Napoleon made a serious mistake in leaving able lieutenants with large garrisons to hold the great German fortresses, thus depriving himself of the assistance of Rapp, who held Danzig with 8000 men, Davout, who was shut up in Hamburg with 12,000 men, and many others. These places were besieged and captured by the allies during the ensuing months, but the bulk of the allied army pressed on towards Paris. Blücher

with the Prussians and part of the Russians crossed the Rhine at Caub (December 31) and began the invasion of France. Schwarzenberg, with the Austrians and the rest of the Russians, entered France by the way of Basel. To meet this double invasion, Napoleon could only muster a small army. This he interposed between Blücher and Schwarzenberg, whom he defeated in turn. Blücher's army was dispersed in the battles of Brienne, Champaubert, Montmirail, and Vauchamps, between Jan 29 and Feb 14, 1814, while divisions of Schwarzenberg's army were severely worsted at Nangis (February 17) and Montereau (February 18).

This first defensive campaign of 1814 is one of the most brilliant defensive fights in military history. The military genius of Napoleon never shone more brightly, though the dulling of his political sense made his failure inevitable. With a little army of worn-out and defeated men, reinforced by a few hastily collected and untrained conscripts, he thrust himself between two vastly superior forces against which he hurled himself alternately with such swiftness, skill, and violence as to shatter the hostile armies and frustrate the plans of the opposing generals. Finally, worn out, he had to succumb to the overwhelming numbers of the foe and to the insuperable obstacles of time and space.

Napoleon, who had refused to accept the proposals of Frankfurt submitted by the allies on Nov 9, 1813, now sent Caulaincourt to meet their representatives in the Congress of Chatillon (Feb 3-March 19, 1814), but with instructions to "sign nothing." The allies once more defined their relations to one another in the Treaty of Chaumont (March 1), brought up new troops, and prepared to crush Napoleon. Napoleon's second defensive campaign of 1814 was a brilliant failure—a stubborn struggle against the inevitable. The first blows were struck at Blücher on March 7 and 9 at Craonne and Laon, but failed to interrupt Blücher's campaign seriously. An attack upon a part of Schwarzenberg's army at Arcis-sur-Aube met with no better success, and so Napoleon turned to the eastward to threaten Schwarzenberg's line of communication. But the great disparity of forces enabled the allies to neglect this movement and to concentrate on Paris. Schwarzenberg and Blücher arrived before Paris on March 30, and after hard fighting with Marmont, Mortier, and Moncey, occupied the French capital. The Emperor arrived just a few hours too late to strike a blow in defense of his capital, and could only make an obstinate attempt to renew the struggle south of Paris, but Ney and the other marshals finally forced him to listen to reason (April 4) and to bring the campaign to a close. In the southwest Soult had been driven from position to position and was about to lose his last battle at Toulouse. Suchet had withdrawn from Spain too late to help Soult; Angereau at Lyons had failed to disturb Schwarzenberg's left flank. In Italy Murat had deserted to the enemy, negotiated with Austria, and turned the Neapolitan army against Eugène Beauharnais, the Viceroy of Italy, who faithfully and ably faced the triple danger of Murat's treachery, the invasion of the Austrians, and the occupation of Genoa by an English force under Lord William Bentinck. On April 11 Napoleon, the Emperor of the French, formally abdicated at Fontainebleau in favor of his infant son, the King of Rome.

In the stipulations with the allies Napoleon was allowed to retain the title and state of Emperor, but was to be detained as a prisoner on the island of Elba. The relations between the newly restored Bourbons and the allies were settled by the First Treaty of Paris on May 30. The changes which had taken place in Europe since the outbreak of war in 1792 had been such that the old order could not be restored, and accordingly a congress of the Powers was summoned to meet at Vienna to make the necessary new arrangements. These were completed on June 9, 1815. But in the meantime Napoleon had left Elba, landed in France on March 1, made his way to Paris, reestablished his power, gathered a new army, and advanced to attack the allies, whose representatives at Vienna planned at once to place new armies in the field and overthrow him a second time. (See HUNDRED DAYS.) The campaign, which lasted only a week, included Napoleon's defeat of Blücher at Ligny (q.v.) on June 16, Ney's fight with Wellington at Quatre-Bras on the same day, and the final overthrow of Napoleon on the field of Waterloo (q.v.) by Wellington and Blücher on June 18, 1815. After this last battle Napoleon fled to Paris, where he abdicated a second time on June 22. For a few days he hesitated between dreams of again playing a part in France and plans for an escape to America. The first was preposterous, the second impossible, and on July 15 he surrendered himself to Captain Maitland on board the English ship *Bellerophon*. The allies under Blücher had entered Paris a second time, on July 7, and made the final adjustments for the settlement of Europe in the Second Treaty of Paris on November 20. Napoleon was taken to England, and after some deliberation his request to be permitted to settle in England was refused. He was transferred to the ship *Northumberland* and on October 16 landed on the island of St Helena. In his captivity he was accompanied by his faithful friend Bertrand, and by Gourgaud, Montholon, Las Cases, and a number of other individuals of minor importance. In 1816 Sir Hudson Lowe, a British soldier, arrived as Governor of the island. Napoleon's chief occupations as a captive were his quarrels with Lowe and his monologues with Gourgaud and Montholon, which they wrote out and submitted for correction to the Emperor. These documents form a partial autobiography, valuable not for its facts, but for the light which it sheds upon Napoleon's character. Napoleon gave himself up to long periods of gloom and humored himself in the most inexcusable obstinacies when a more rational behavior would have improved his health and rendered his surroundings more agreeable socially. Cancer of the stomach, which had carried off his father and which was to cause the death of two of his sisters, was slowly undermining his health, and on May 5, 1821, he breathed his last at the set of sun. He was buried with military honors upon the island, but, in accord with his own request, his remains were in 1840 taken from the island, attended by the faithful Bertrand, and under the direction of Louis Philippe placed in a magnificent sarcophagus beneath the dome of the *Hôtel des Invalides* in Paris. After his death and the restoration of the Bourbons a romantic tradition gathered about the name of Napoleon, which found expression in the literature of the period, notably the poetry of Béranger. He appeared to

many the champion of the people, the bearer of the gospel of the French Revolution to the world, a martyr to the lost cause of democracy. It is in this rôle that he is portrayed in *The Napoleonic Ideas* of his nephew, Napoleon III. To others he was the archadventurer, the traitor to the democratic cause, who exploited the results of the Revolution for his own ends and used the Revolutionary phraseology and idealism to cloak a tyranny more dangerous because more effective than the despotism of the old régime. He is significant historically not merely for the magnitude of his military exploits but for the ideas that these embodied in his own mind and in that of the French people. Napoleon carried to the world by force of arms the ideas of eighteenth-century France. The fabric of feudalism with all its inconsistencies and absurdities crumbled at his touch and in its place appeared the foundations of the nineteenth-century state, strange compound of political democracy and economic class rule. But it was the middle classes who now occupied the dominant position of the old feudal aristocracy. And it was a modern middle-class state with efficient centralized administration, uniform law, postal service and coinage, popular education and popular representation, and freedom of contract in economic matters that Napoleon made possible in every country of Europe to which his influence extended. The remnants of serfdom, the privileges, legal and economic, of the mediæval Church and the landed aristocracy, the archaic political system, in which despotism was combined with disorganization and maladministration, gave way before the bureaucratic, businesslike, logically organized modern state, with a modern ruler at its head, of a type embodied later in Bismarck and Napoleon III—one who was able to yoke the new democracy to the service of an oligarchy, whether plutocratic or aristocratic, who could rear a new despotism under cover of representative institutions and could appease the popular aspirations in internal politics with a brilliant foreign policy and an appeal to the enthusiastic young nationalism to which the downfall of the feudal régime had given birth.

Bibliography. Excellent lives in English are: J. H. Rose, *Life of Napoleon* (New York, 1907); W. M. Sloane, *Life of Napoleon Bonaparte* (4 vols., ib., 1910); I. M. Tarbell, *Life of Napoleon Bonaparte* (ib., 1911); August Fournier, *Napoleon I: A Biography* (new enlarged edition, 2 vols., ib., 1915). Of the numerous other works on the life and times of Napoleon, the more important are: L. A. Thiers, *Histoire de la Révolution* (10 vols., Paris, 1823-27; Eng. trans. by Frederick Shoberg, 4 vols., New York, 1897); L. P. E. Bignon, *Histoire de France* (14 vols., Paris, 1829-50); A. C. Thibaudeau, *Le Consulat et l'Empire* (10 vols., ib., 1834-35; Eng. trans., New York, 1908); L. A. Thiers, *Histoire du Consulat* (21 vols., Paris, 1845-74; Eng. trans. by D. F. Campbell, London, 1845-62); Pierre Lanfrey, *Histoire de Napoléon* (5 vols., ib., 1868-75; Eng. trans., 2d ed., 4 vols., New York, 1894); August Fournier, *Napoleon I: eine Biographie* (Leipzig, 1886-89; Eng. trans., now ed., 2 vols., New York, 1911). For the early life of Bonaparte: H. F. T. Jung, *Bonaparte et son temps* (3 vols., Paris, 1880-81); A. M. Chuquet, *La jeunesse de Napoléon* (ib., 1897-99), and Oscar Browning, *Boyhood and Youth of Napoleon* (New York, 1906), are

the most important. For the personal life of Napoleon, Arthur Lévy, *Napoléon intime* (Paris, 1893); Frédéric Masson, *Napoléon chez lui* (ib., 1893); id., *Napoléon inconnu* (2 vols., ib., 1895); id., *Napoléon et sa famille* (5th ed., 9 vols., ib., 1897-1907), and id., *Napoléon et les femmes* (ib., 1906), are the most valuable. On the military genius of Napoleon the most accessible are Maximilien Yorck von Wartenburg, *Napoleon als Feldherr* (Berlin, 1885-86; Eng. trans., 2 vols., New York, 1914); Henry Housaye, 1814 (Paris, 1888); id., 1815 (ib., 1894-99); J. C. Ropes, *Campaign of Waterloo* (New York, 1893); G. H. Sargent, *Napoleon Bonaparte's First Campaign* (Chicago, 1894); J. C. Ropes, *The First Napoleon* (12th ed., Boston, 1895); G. H. Sargent, *Campaign of Marengo* (Chicago, 1897); M. B. Gibbs, *Military Career of Napoleon the Great* (New York, 1901); C. C. Chesney, *Waterloo Lectures* (4th ed., ib., 1907); A. F. Becke, *Napoleon and Waterloo* (2 vols., London, 1914). For naval affairs, A. T. Mahan, *Influence of Sea Power upon the French Revolution and Empire* (2 vols., Boston, 1893). The best selected bibliography on Napoleon I and his epoch is to be found in *Cambridge Modern History*, vol. ix (New York, 1906).

NAPOLÉON II. Son of Napoleon I. See REICHSTADT, DUKE OF

NAPOLÉON III, CHARLES LOUIS NAPOLÉON BONAPARTE (1808-73) Emperor of the French. He was the third son of Louis Bonaparte, King of Holland, and of Hortense Beauharnais. (See BONAPARTE.) The law of succession enacted under the First Empire gave the crown, in default of direct descendants of the Emperor, to the sons of either Joseph or Louis Bonaparte. Joseph being childless, the sons of Louis became heirs apparent of the Napoleonic pretensions. Louis Napoleon was born April 20, 1808, in Paris. He spent his boyhood with his mother at her château of Arenenberg in Switzerland, and at Augsburg, where he studied in the Gymnasium. After the death of his elder brother in 1831, he returned to France with his mother, but they were expelled by Louis Philippe, went to England, and thence returned to Switzerland. The death of the Duke of Reichstadt (July 22, 1832), only son of the first Napoleon, left Louis Napoleon the representative of his family, and thereafter the restoration of the Napoleonic Empire became his fixed idea. During the next four years his published works kept him before the French people. Among them were *Révères politiques*; *Projet de constitution*; *Deux mots à M. de Chateaubriand sur la duchesse de Berri* (in verse); *Considérations politiques et militaires sur la Suisse*. In 1836, believing in the weakness of the July monarchy, he undertook at Strassburg a coup which was so absurd a failure that it covered him with ridicule. He was sent to America, but returned to Europe on account of his mother's illness. She died Oct. 3, 1837, and soon afterward the French government asked for his expulsion by Switzerland. He went to London, where, in 1838, he published the *Idées napoléoniennes*, which had considerable circulation in France. In this interpretation of the ideas of the first Napoleon, whom he pictures as the protagonist of the ideas of the French Revolution of 1789, he outlines his own political philosophy, which was a strange combination of Cæsarism with a revolutionary democracy verging on Socialism. In 1840 he made at Boulogne his second attempt to bring

about a military uprising in his favor, but this was as complete a failure as its predecessor. He was imprisoned in the fortress of Ham, where he wrote several works, some political articles, and had a share in editing the *Dictionnaire de la conversation*. He escaped from Ham, May 25, 1846, and made his way to the Belgian frontier and thence to England. He hastened back to France when the Revolution of 1848 broke out, but, although he professed devotion to the provisional government, he was distrusted and asked to leave the country. Notwithstanding his promise to do this, he obtained an election to the National Assembly for Paris and three other departments. He took his seat on June 13, 1848, but resigned on the 15th, after a stormy debate, and left France. He was, however, elected from five departments in September, and returning became a candidate for the presidency. He received 5,500,000 votes in the election of Dec. 10, 1848, his closest opponent, General Cavaignac (q.v.), having 1,500,000. He entered upon his office on December 20. His presidency was a continuous contest with the majority in the Assembly, who continued to doubt the sincerity of the President's devotion to the Republic. This disturbed condition was ended by the coup d'état of Dec. 2, 1851, a thoroughly Napoleonic stroke, carried out with blunt disregard for law or political honesty, by the President himself, assisted by Morny, Maupas, and Saint-Arnaud. The cost of success was the establishment of a repressive tyranny maintained by military force. France submitted to the new ruler, who promised to restore the glories of the past. On December 20-21 the President was reelected for 10 years by more than 7,000,000 votes, practically without opposition. He had revived the plebiscite, used with such effect by his uncle—a plebiscite so managed that the issue was a foregone conclusion. In the same way, when he had himself proclaimed Emperor, as Napoleon III, just a year after the coup d'état (Dec. 2, 1852), it was made to appear that this also was in accordance with the popular will. The new Emperor had studied his uncle's methods and attempted to imitate him as far as circumstances and his own ability would permit, but he only won for himself the name of Napoleon the Little. He possessed ability, but it was that of the politician rather than of the statesman. He lacked the dash and rapidity of decision which were the chief elements in accomplishing the vast schemes of the first Napoleon. Napoleon III hesitated in deciding upon a policy and was slow in carrying it out when once determined. Some conspiracies against him developed as early as 1853, and three attempts were made to assassinate him—by Pianori and Bellamare in 1855 and by Orsini (q.v.) in 1858.

Napoleon III was looked upon coldly by the "legitimate" sovereigns of Europe, but the aim of his foreign policy was to make France again dominant in European affairs and himself the general arbiter of the Continent. To check the similar pretensions of Nicholas I of Russia in eastern Europe, he joined England in protecting Turkey against Russian aggression, and France took the leading part in the Crimean War (q.v.). The pacification which followed and the adjustment of the Eastern Question (q.v.) were arranged by a congress at Paris. (See PARIS, TREATIES OF.) The three eastern Powers, Russia, Prussia, and Austria, which were the

strongholds of legitimacy and autocracy, as against the democracy of France and England, were Napoleon's natural opponents. In the Crimean War he administered a lesson to one of them. By befriending Italy, which under the leadership of Sardinia was struggling to free itself from Austrian oppression, he found an opportunity to strike at Austria and to uphold in the most marked manner his favorite political hobby, the principle of nationalities. He encouraged Cavour (q.v.) in the advocacy of Italy's cause at the Congress of Paris, and, though the attempt of Orsini upon the Emperor's life almost destroyed the cordial relations that had been cultivated between the courts of Paris and Turin, under Cavour's shrewd management the Emperor finally became more friendly than ever. The two held a private conference at Plombières, July 20, 1858, at which Napoleon agreed to support Sardinia in case of an attack by Austria. Cavour at once forced Austria into aggressive action, and Napoleon, now half repentant of his engagement, took the field. The Italian campaign of 1859, in which Napoleon showed himself utterly incapable of military leadership, was marked by two great battles, Magenta and Solferino, won by the allies. Napoleon then selfishly closed the struggle by the preliminaries of Villafranca. (See CAVOUR, ITALY.) He exacted from Victor Emmanuel the cession of Nice and Savoy, although he had failed to deliver Venetia and the duchies. His later relations with Italy were disturbed by the fact that he felt called upon to uphold the Pope in his temporal possessions, and thus clashed with the national ambition of the Italians for complete unity with Rome as the capital. The protection of French troops was only withdrawn from the Papal States when war with Prussia had begun. During the Civil War in the United States (1861-65) Napoleon took an active part with the English government in the diplomatic intrigues against the United States. He took advantage of the disturbed condition of Mexican affairs and of the preoccupation of the United States to revive his uncle's dream of a Latin-American empire under French protection, by establishing the Archduke Maximilian on the new Imperial throne of Mexico by means of French bayonets. Secretary Seward warned the French Emperor that the government of the United States could only consider this as an infringement of the Monroe Doctrine and an unfriendly act, but no attention was paid to this protest until the termination of the Civil War made it possible to send General Sheridan with an army of seasoned troops to the Mexican frontier, when the French troops were removed and the unstable Mexican Empire collapsed (1867). This struck a great blow at the prestige of the Emperor. In 1863-64, when the Schleswig-Holstein (q.v.) question engaged the attention of the Powers, Napoleon refused to aid Denmark in her fight for the duchies and advocated the recognition of the principle of nationalities through the union of the German portion of the duchies to Germany. On the eve of the War of 1866 Napoleon entered into negotiations with both Prussia and Austria with respect to an alliance, but he was foiled by Bismarck's diplomacy, and the swift issue of the Seven Weeks' War (q.v.) revealed to Napoleon a new military power under masterful guidance, threatening his schemes for European control. Austria ceded Venetia to Napoleon with the

understanding that it was to be made over to Italy. This was his last appearance in the rôle of an arbiter in the affairs of Europe.

The internal history of the Empire divides itself into two periods—that of the autocratic and that of the liberal Empire. The former Carbonaro risen to power became a powerful enemy of the democratic movement. At the outset he brought under his own control the finances and public enterprises, public liberty was restricted, and a thorough system of police espionage was organized. Napoleon married, Jan. 30, 1853, Eugénie de Montijo, a young Spanish countess, and gratified his own ambitions and her tastes with a brilliant, extravagant, and frivolous court. The Empress Eugénie's influence was always exerted in the interest of the Ultramontane Catholic party. In these days of his absolute power Napoleon pushed public improvements with great energy. Philanthropic institutions were multiplied in France, industrial development was encouraged, and an era of great material prosperity followed, degenerating into one of speculation and luxurious living in which were the seeds of decadence. Railroads and highways were constructed and lines of steamships were established and subsidized. Canals were built and harbors improved. Manufactures, agriculture, and forestry were all fostered by the state. Stock companies were created, and the *crédit foncier* and the *crédit mobilier* stimulated these enterprises with financial support. Paris, under the Prefect Haussmann, was transformed. As early as the exposition of 1855 Paris was able to show a new city to its visitors, and at the brilliant exposition of 1867 this development was still more marked. Politically there were three parties in opposition—Legitimists, Orleanists, and Republicans. Of these the Legitimists were almost lost sight of, with the exception of a few irreconcilable leaders. The Orleanists were stronger in numbers and in the quality of their adherents and gave the Emperor more anxiety. The great literary leaders were found in their camp, and the French Academy was their stronghold. The really active opposition, however, lay with the Republicans. None of these parties had any legal means of expression or action. In 1858, after the Orsini attempt, the General Security Act was forced through the Corps Législatif, giving the government power to exile or transport without trial any person convicted of a political offense. Wholesale arrests were made under this act for the purpose of intimidating the Republicans. Having alienated the Ultramontanes, upon whose support he had hitherto depended, by the Italian war, Napoleon relaxed some of his repressive measures to gain the support of the Liberals. In 1859 an amnesty decree allowed the return of the exiles of 1851. This was followed by a grant of more freedom of action to the Corps Législatif. The commercial treaty of 1860 with England abolished the prohibitions and lowered many of the high protective duties which had formed a part of the Emperor's commercial system. The restrictions upon the freedom of the press were partially removed. A Liberal opposition now began to organize through a coalition of the opposition parties, and after 1863 there was real parliamentary activity in France. A section known as Liberal Imperialists supported the Emperor, but opposed his reactionary ministers. The ministry, headed by Rouher, and with Drouyn

de Lhuys in charge of foreign affairs, favored a vigorous attitude of opposition to Prussia. The Emperor was broken in health, and after the Prussian triumph over Austria had demoralized his plans and left him discredited with his own ministers, he turned for support to the constitutionalists in the Corps Législatif. The liberties of that body and of the press were much extended, and the right to hold public political meetings was conceded. In 1869 a responsible ministry was granted.

In 1870 the following proposition was submitted to a plebiscite: "The French nation approves the liberal reforms made in the constitution since 1860, and ratifies the senatorial decree of April 20, 1870." This was opposed by the Republicans, but was carried by a vote of 7,000,000 to 1,500,000. This popular support of the Imperial régime was apparent rather than real. Notwithstanding temporary coalitions, the different parties were still irreconcilable. The autocratic and war party, which had voted in the affirmative on the plebiscite, came again into power in the Corps Législatif, with the Duke of Grammont in charge of foreign affairs. Partly compelled by the diplomacy of Bismarck and partly actuated by their own aims, the ministry brought on the war with Prussia, much against the will of the Emperor. (See FRANCO-GERMAN WAR.) The Emperor went to the front, leaving the Empress as Regent, and she constituted a ministry of the war party under General Faidherbe. Napoleon was captured at Sedan (Sept. 2, 1870), and on the 4th of September was taken to the castle of Wilhelmshöhe, near Cassel. In the wild confusion that attended the news of defeat in Paris and the declaration of the Republic, the Empress fled from the city and went to England, taking up her residence at Chiselmhurst, Kent, where she was joined by Napoleon in 1871, after the conclusion of peace. He resided there until his death, Jan. 9, 1873.

Napoleon and Eugénie had one child, a son, Eugénie Louis Jean Joseph, Prince Imperial of France, born March 16, 1856. See NAPOLEON, EUGÈNE LOUIS JEAN JOSEPH.

Bibliography. A collection of Napoleon's own works was published in five volumes (Paris, 1869). Many of them, including the *History of Julius Caesar* and *Napoleonic Ideas*, have been translated into English. The *Posthumous Works and Unpublished Autographs of Napoleon III in Exile* were edited by De la Chapelle and published in 1873. The leading comprehensive histories of the Second Empire are: De la Gorce, *Histoire du second empire* (4 vols., Paris, 1885-98), which partially supersedes the earlier work by Tixier de la Rochelle, *Histoire du second empire* (6 vols., ib., 1869-76). Consult also Bernhard Simson, *Ueber die Beziehungen Napoleons III. zu Preussen und Deutschland* (Freiburg, 1882); Adolf Ebeling, *Napoleon III. und sein Hof* (Cologne, 1891-94); Thirria, *Napoléon III avant l'empire* (Paris, 1895); E. Ollivier, *L'Empire libéral* (ib., 1895-1909); A. L. NAPOLEON, EUGÈNE LOUIS JEAN JOSEPH (1856-79). The only son of Napoleon III of France, better known as the Prince Imperial. He was born in the Tuileries in Paris, March 16, 1856. At the outbreak of the Franco-German War of 1870-71 he accompanied his father to the front and was first under fire at Saarbrücken. When the war began to go against the Imperial arms, however, he was sent to England, where he joined his mother after her flight from Paris. From 1872 to 1875 he attended the artillery school at Woolwich. Upon the death of his father he took the title of Count of Ploërmel. In 1874 he reached his majority and was proclaimed as Napoleon IV by his adherents. Five years later he joined a British expedition against the Zulus, and while reconnoitring was ambushed and killed (June 1, 1879). He was buried beside his father at Farnborough, England. Consult: Ellen Barlee, *Life of Napoleon, Prince Imperial of France* (London, 1889); M. d'Hérissou, *Le prince impérial* (Paris, 1890); André Martinet, *Le prince impérial* (ib., 1895); R. Minon, *Les derniers jours du prince impérial sur le continent* (ib., 1900); Ernest Barthez, *Empress Eugénie and her Circle* (New York, 1913).

NAPOLEON, JOSEPH CHARLES PAUL, PRINCE (1822-91). A son of Jerome Bonaparte. See BONAPARTE.

NAPOLEON GUN. See ARTILLERY.

NAPOLEON LE PETIT, le petit (Fr., Napoleon the Little). A violent satirical attack on Louis Napoleon by Victor Hugo, written at Brussels in 1852.

NAPOLEON'S TOMB. The magnificent burial place of Napoleon Bonaparte is under the dome of the Invalides, Paris. It was constructed by Visconti and has the form of a circular crypt 20 feet deep and 36 in diameter, open at the top. On the granite walls are 10 marble reliefs by Smart. The mosaic pavement, representing a laurel wreath, bears the names of various battles. In the middle rises the red porphyry sarcophagus, 13 feet long, 6½ wide, and 14½ high, cut from a single block weighing 67 tons, surrounded by 12 victories by Pradier. Above the entrance to the crypt is a sentence from Napoleon's will: "I desire that my ashes shall rest on the banks of the Seine, in the midst of the French people that I have loved so well." On one side is the sarcophagus of the Emperor's friend Duroc, who fell at Bautzen in 1813, on the other that of his faithful companion Bertrand, who shared his captivity. Napoleon's remains were brought from St. Helena to their present burial place by the Prince de Joinville in 1840.

NAPOLÉON-VENDEE, vā'n'dā'. A former name of Roche-sur-Yon (q.v.), a town in France.

NAPRAVNİK, nā-prāv'nĕk, EDWARD FRANZEVICH (1839-). A Bohemian pianist, conductor, and composer. He was born at Bejst, near Königgratz, and studied at the Prague Organ School in 1853-54. He became an instructor in the Maydl Institute for Music at Prague in 1856, and in 1861-63 he directed Prince Yussupoff's private orchestra at St. Petersburg (now Petrograd). In the latter year he was appointed organist of the Imperial Russian Opera, of which he became second conductor in 1867 and chief conductor in 1869. His operatic productions include *The Inhabitants of Nizhni Novgorod* (1868); *Harold* (1886); *Dubrovsky* (1895); *Francesca da Rimini* (1903). He composed also the overture *Vlasta* (1861), the symphonic poem *The Demon* (1879), other orchestral selections, and Bohemian and Russian songs.

NAQUET, nā'kă', ALFRED JOSEPH (1834-). A French politician and social reformer, born at Carpentras, Vaucluse. In 1863 he became professor in the medical faculty at Paris and later in the same year professor of chemistry at Palermo, Italy. Returning to France in 1865, he was sent to prison for 15 months in 1867 for his membership in a secret society. Upon the publication of his book, *Religion, propriété, famille* (1869), he was compelled to flee to Spain, but he returned to participate in the revolution of 1870. In 1871 he was elected a deputy for Vaucluse in the National Assembly, where he joined the party of the Extreme Left. He was reelected in 1876 and 1881, served as a Senator in 1882-89, and was a deputy for Paris in 1890-98. He began his agitation for a divorce law in 1876 in the Chamber of Deputies, and finally secured its adoption in the Senate in 1884. Naquet is author of *Principes de chimie fondés sur les théories modernes* (1865; 5th ed., 1890; Eng. trans., 1868); *La république radicale* (1873); *Le divorce* (1877; 2d ed., 1881); *Questions constitutionnelles* (1883); *Socialisme collectiviste et socialisme libéral* (1890; Eng. trans., *Collectivism and Socialism of the Liberal School*, 1895); *Temps futurs* (1900); *L'humanité et la patrie* (1901); *La loi du divorce* (1903); *L'anarchie et la collectivisme* (1904); *Désarmement ou alliance anglaise* (1908).

NARA, nā'ra. The capital of a prefecture of the same name on the island of Hondo, Japan, situated 25 miles by rail southeast of Osaka (Map Japan, D 6). It was the capital of Japan from 709 to 784. The most interesting temples are the Kasuga, situated in a magnificent park; the Todai-ji with its huge bell, over 13 feet high and more than 9 feet in diameter, and the gigantic statue of Buddha, over 53 feet high, and the Kokubu-ji with the modern statues of Brahma and Indra. Of great archaeological value is the storehouse in which specimens of articles used in the Imperial household for over a thousand years have been preserved. The local museum is also of considerable archaeological interest. The principal manufactures of Nara are India ink, fans, and modern toys. Pop., 1898, 30,539; 1908, 32,732.

NARAKA, nā'rā-kā' (Skt., hell). The hell of the Hindus. The doctrine of a place for the bad, though not necessarily a place of torment, is as old as the Veda. This region was one of bottomless darkness beneath the earth. The

faith of the Brahmanic period and of the Upanishads had the same belief, and the descriptions of hell torments became fully developed later. Manu enumerates 21 hells and gives a general description of the tortures which await the impious there. The Puranas, however, are more systematic. The Vishnu-Purana, e.g., not only names 28 such hells, but distinctly assigns each of them to a particular class of sinners. Consult Lucian Scherman, *Materialien zur Geschichte der indischen Litteratur* (Leipzig, 1892), and E. W. Hopkins, *Religions of India* (Boston, 1895).

NARAM SIN ('beloved of Sin'). A Babylonian king of the dynasty of Akkad. He was long supposed to be the son of Sargon I, the founder of the dynasty; but a close study of the list of kings published by Scheil in 1911 tends to render it probable that he was the son of Shargamisharri, or Sargon II, the fourth king of the dynasty, who was apparently often confused with Sargon I. Though Sargon I, Manishtusu, and Rimush are called "kings of Kish," it is held by many scholars that they were the first three rulers of the dynasty of Akkad. Naram Sin fought with Magan in east Arabia, and with the Lulubians. He ruled at Susa, as an Elamitic inscription shows. A statue of this King has been found north of Diarbekr. It is possible that he made a raid on Cyprus. His features are purely Semitic. According to Nabunaid, he reigned 3200 years before his time, i.e., c.3750 B.C. Some scholars have doubted the accuracy of this statement, assuming either a textual error for 2200, a calculation based on the precession of the equinoxes, each degree being reckoned at 100 years instead of 72, or a fancy of the ancient chronologists. In view of the long lists of kings for these remote periods, with altogether probable regnal years attached, it would seem most methodical to accept tentatively the date assigned by Nabunaid's scribes. See BABYLONIA. Consult Scheil, in *Comptes rendus de l'Académie des Inscriptions et Belles Lettres*, pp. 606 ff. (Paris, 1911); Poebel, in *Orientalische Literaturzeitung*, xv, 481 ff. (Leipzig, 1912); Ed. Meyer, *Geschichte des Altertums*, i, 2 (3d ed., Stuttgart, 1913).

NARANJO, nā-rā'n'ho. A ruined city of the Maya Indians in the Peten region of Guatemala, not far from the boundary of British Honduras. Over 30 monoliths bearing sculptured figures and dates are found at this site. None of the structures has been excavated, but enormous pyramids arranged around courts served as foundations for a great series of religious and civil buildings. The dated monuments furnish important evidence on ancient Mayan history. The city flourished about 500 A.D. Consult: T. Maler, "Explorations in the Department of Peten, Guatemala," in *Memoirs of the Peabody Museum of American Archaeology and Ethnology*, vol. iv (Cambridge, 1908); S. G. Morley, "The Inscriptions at Naranjo, Northern Guatemala," in *American Anthropologist*, vol. xi (Washington, 1909); H. J. Spinden, "Maya Art," in *Memoirs of the Peabody Museum of American Archaeology and Ethnology*, vol. vi (Cambridge, 1913).

NARAOIA, nār'ā-oi'ā. One of the remarkable genera of fossil branchiopod crustaceans recently discovered by Walcott in the Middle Cambrian shale (Stephen formation) of British Columbia. It has two nearly equal carapaces, the one covering the cephalic and the other the

thoracic region, and a large number of legs. See STEPHEN FORMATION.

NARBADA, nār-būd'ā. A river of India. See NERBUDDA.

NARBO. See NARBONNE.

NARBONNE, nār'būn' (Lat. *Narbo*) A town in the Department of Aude in south France, situated 6 miles from the Mediterranean and 37 miles east of Carcassonne (Map: France, S., H 5) The town is divided into old and new quarters by the Robine Canal. The streets of the former present a poor appearance. The church of St. Just was in olden times the cathedral. It is an imposing though uncompleted structure, begun in the thirteenth century, and exhibiting many of the most daring ideas of the Gothic. The Gothic hôtel de ville is a creation of Viollet-le-Duc. It houses the Narbonne Museum with paintings and ceramics. Narbonne has a hydrographical school, a seminary, a college, and a public library of 15,000 volumes. Its industries include coopering and distilling establishments. It produces verdigris, candles, tiles, pottery, dyes, hoops, mosaic work, tools, and leather. It deals in wine, grain, honey, oil, salt, and sulphur. Its honey is famous, and its red wine is peculiar to the district. It has a chamber of agriculture and an œnological station, the latter established in 1894. The town is on a branch of the important Canal du Midi. About 11 miles to the south is the port La Nouvelle, at the end of the Narbonne Canal. It is the harbor for Narbonne and has some manufactories. Pop., 1901, 28,852, 1911, 28,173. Narbo became Roman in 116 B.C. It was at the time one of the leading ports of the Mediterranean, and well known for its beauty and attractions as a city. *Narbo Martius*, as it was called, was the capital of the Provincia Romana and later of Gallia Narbonensis. In 413 it passed under the sway of the Visigoths, and about 720 it fell into the hands of the Saracens, from whom it passed into the possession of the Franks in 759. The viscounts of Narbonne became hereditary feudatories of the French crown in 1080. In 1447 Viscount William III sold Narbonne to the house of Foix, and in 1507 the fief was united with the French crown. Late in the Middle Ages the harbor of Narbonne became practically filled up and the town began to decline.

NARBROUGH, nār'brū, SIR JOHN (1640-88). An English admiral and explorer. In 1670 he made a notable voyage through the Strait of Magellan and up the Chilean coast. He greatly distinguished himself at the battle of Solebay in 1672, and was knighted by King Charles II and made rear admiral in 1673. The following year he sailed in command of a squadron to the Mediterranean, where he distinguished himself by scattering the pirates of Tripoli and Algiers. In 1680-87 he was commissioner of the navy, and in the latter year sailed to the West Indies in command of a squadron, and died there of fever while superintending the investigation of a sunken treasure ship. He was buried at sea off Santo Domingo.

NARCEINE, nar'sē-in. See ALKALOIDS.

NARCISSUS (Lat. from Gk. *Νάρκισσος*, *Narkissos*, from *νάρκη*, *narkē*, torpor. The flower has narcotic properties). According to Ovid, *Metamorphoses*, iii, 341-510, the son of the river god Cephissus and of the nymph Liriope of Thespie in Boeotia. He was a youth of extraordinary beauty, but refused all suitors, includ-

ing Echo (q.v.). They prayed to Nemesis for vengeance, and she caused Narcissus to see his own image in a forest spring. Enamored of this, he pined away in hopeless love beside the stream. From his body sprang the flower narcissus, which for a little while is mirrored in the waters and then fades. The story, which seems to be of Alexandrian origin, is told with variations by other late Greek and Roman writers; it is a counterpart to the stories of Adonis (q.v.), Linus (q.v.), and Hyacinthus (q.v.). Consult C. M. Gayley, *The Classic Myths in English Literature and in Art* (2d ed, Boston, 1911). The bronze statuette in Naples, commonly called Narcissus, really represents the youthful Dionysus.

NARCISSUS. A genus of beautiful bulbous plants of the family Amaryllidaceæ, with narrow leaves and usually white or yellow flowers. The species are natives of southern Europe, northern Africa, and the temperate parts of Asia. Many are cultivated in gardens for the sake of their beautiful and often fragrant flowers, which in general appear early in the season. Some of them are known by the names of daffodil and jonquil. The different species

NARCISSUS

a, poet's narcissus (*Narcissus poeticus*), b, jonquil (*Narcissus jonquilla*), c, trumpet daffodil (*Narcissus pseudonarcissus*)

are naturally separated into two divisions—those bearing but one flower on a scape and those bearing more than one. The poet's narcissus (*Narcissus poeticus*) is perhaps the best known and most popular species. It is a hardy plant and bears white fragrant flowers. The jonquil (*Narcissus jonquilla*) bears from two to five very fragrant golden-yellow blossoms on a scape. This species is employed in the manufacture of perfumes. *Narcissus tazetta* is the narcissus of the ancient Greeks and Romans and is now largely grown as a forcing-house plant. There are numerous varieties of this species with white, yellow, single and double flowers. *Narcissus pseudo-narcissus* is com-

monly called daffodil or trumpet daffodil. The plants are ordinarily propagated by offset bulbs which are produced on the bulb. These usually flower the second year after planting. See JONQUIL, Colored Plate of AMARYLLIDACEÆ, and cut in article CORONA.

NARCOTICS (Gk. *ναρκωτικός*, *narkotikos*, benumbing, from *ναρκῶν*, *narkoun*, to benumb, from *νάρκη*, *narkē*, torpor, connected with OHG. *snærhan*, to draw together, AS *snear*, Eng. *snare*). Remedies which, in moderate doses, lessen the action of the nervous system. Their full operation is sleep or coma. Opium (qv) is the type from which most descriptions of this class of medicines have been drawn, but, although most narcotics more or less resemble opium in their action, almost every one presents some peculiarity in the way in which it affects the system. These medicines are primarily stimulating, especially when given in small or moderate doses, but this stage of their action is comparatively short, and when the dose is large the excitement is scarcely perceptible. Their power of inducing sleep has procured for them the names of hypnotics and soporifics; while many of them are termed anodynes, from their possessing the property of alleviating pain. Next to opium and the general anæsthetics, hyoscyamus, Indian hemp, and chloral may be regarded as the most important narcotics. Cocaine should also be included in the list of narcotics. Of late years a number of coal-tar derivatives have been introduced, such as sulphonal, trional, and veronal, which are taking the place, to some extent, of the older remedies.

It has been already mentioned that there are differences in the mode of operation of the different members of this class. Alcohol, e.g., in sufficient doses produces intoxication; belladonna, delirium, opium contracts the pupil of the eye, hyoscyamus dilates it. Each drug affects the organism in its own peculiar way, and a description of its special qualities will be found in the article devoted to it.

Narcotics are usually administered with the view either of inducing sleep or of alleviating pain or spasm. As, however, their action is much modified by a variety of circumstances—such as age, idiosyncrasy, and prolonged use—they should be administered with extreme caution and only under competent advice. But the effects produced by these narcotics have become so generally known that many persons have availed themselves of these drugs, especially morphine and codeine, heroin, and cocaine. The use became so widespread that severe laws, Federal as well as State, were passed, preventing the indiscriminate sale and use of these drugs. Forty-nine political divisions have some form of cocaine legislation, and 37 have laws restricting the use and sale of opium and its derivatives. (Consult *Efforts to Curb the Misuse of Narcotic Drugs*, reprint No. 267 from the Public Health Reports, Washington, 1915.) The various quack medicines for children which are known as *carnivatives*, *soothing syrups*, etc., contain some form of opium, and formerly were a fertile cause of the great mortality that occurs in early life, especially among the poorer classes; but stringent laws have largely eliminated this evil.

NARCOTINE, $C_{17}H_{21}NO$. One of the organic bases or alkaloids occurring in opium, in which it usually exists in the proportion of 6 to 8 per

cent. It is nearly insoluble in water and sparingly soluble in alcohol and ether, but dissolves readily in chloroform. Its solutions turn the plane of polarized light to the left; the solutions of its salts (in the presence of free acids) have the opposite effect. Narcotine possesses very slight alkaline properties; its salts do not readily crystallize and are even more bitter than those of morphine, although the substance itself is almost tasteless. See ALKALOIDS.

NARD. A fragrant plant. See SPIKENARD.

NARDINI, nâr-dé'nê, PIETRO (1722–93). An Italian composer and violinist, born at Fibiiana (Tuscany). He was a pupil of Tartini (qv.) and from 1753 to 1767 was solo violinist of the court chapel at Stuttgart. From 1770 till his death he occupied the position of court conductor at Florence. He was famous for the absolute purity of his intonation and a beautiful singing tone. His compositions consist of six concertos for violin, six violin sonatas, six string quartets, six flute trios.

NARDÒ, nâr-dô' (Lat. *Neretum*). An episcopal town in the Province of Lecce, Italy, 34 miles south of Bùndisi (Map Italy, F 4). It has a cathedral, an ancient castle, and old walls, and manufactures woolen goods and tobacco. The surrounding country abounds in olive plantations and vineyards. Pop. (commune), 1901, 14,387. 1911, 16,567.

NARDUS (Lat. *nard*, from Gk. *νάρδος*, from Pers. *nard*, from Skt. *nalada*, Indian spikenard). A genus of one species of grass (*Nardus stricta*), often called matgrass, a purplish perennial growing in tufts characteristic of dry elevated situations in Europe, Australia, etc. It has little or no feeding value.

NARES, nârz, SIR GEORGE SFRONG (1831–1915). A British Arctic explorer, born at Danestown, Scotland. He entered the navy in 1846 and went on the *Resolute* in the Arctic expedition of 1852. In 1872–74 he commanded the famous *Challenger* expedition, engaged in deep-sea exploration. In 1875, in command of the *Alert* and *Discovey*, he set out on a polar expedition, and proceeding up Smith Sound he reached with the *Alert* the parallel of 82° 27', the farthest north any ship had then gone. Markham, his lieutenant, went on sledges in 1876 as far as 83° 20', another record at the time. Another lieutenant, Aldrich, extended the coasts of Grinnell Land 220 miles to the west, while Beaumont reached St. George Fjord in Greenland and sighted Cape Britannia. An outbreak of scurvy obliged the return of the expedition in 1876. In this year Nares was made K.C.B. In 1878 Nares surveyed Magellan Strait and parts of the Pacific. He served as professional officer of the Board of Trade (1879–96), during this period being made vice admiral (1892), and in 1902 became acting conservator of the river Mersey. He wrote *Reports on Ocean Soundings and Temperature* (1874–75); *Official Report of the Arctic Expedition* (1876); *Narrative of a Voyage to the Polar Sea* (1878). Consult *Arctic Expedition, 1875–76 Report of the Committee of Enquiry* (London, 1877).

NARES, ROBERT (1753–1829). An English philologist, born at York. After studying at Christ Church, Oxford, he took orders, and from 1798 until his death was canon of Lichfield. As critic, essayist, and theologian he held a high rank among the writers of his time. With the Rev. William Beloe he founded the *British Critic* in 1793. Among his many publications should

be mentioned: *Elements of Orthoepy* (1784); *Chronological View of the Prophecies Relating to the Christian Church* (1805); *A Glossary of Words, Phrases, Names, and Allusions . . . in the Works of English Authors* (1822), which is by far his most important work

NAREW, ná'réf. A river of west Russia, rising in the Government of Grodno. It flows westward, forming part of the boundary of Poland, and joins the Bug 19 miles north of Warsaw. Its length is 271 miles, 212 of which are navigable. The Augustowo Canal connects it with the Niemen.

NARIÑO, ná-rē'nyó. A maritime department of Colombia, located in the southwestern part of the country. It is bounded by the Department of Cauca on the north, the Intendency of Cauca on the east, Ecuador on the south and west, and the Pacific Ocean on the west. The department was established in 1904 and has an area of 11,580 square miles. It is composed of three nearly equal regions—the western, between the Pacific and the Western Cordillera, the central, between the Western and Central Cordilleras, and the eastern, east of the Central Cordillera. The western region is arid and uncultivated and is inhabited by whites and negroes. The central region is fertile, producing sugar cane, cacao, rice, potatoes, corn, wheat, and barley. Two-thirds of the inhabitants are white and the remainder Indians. The eastern region is undeveloped, and is inhabited mainly by natives, many of whom are uncivilized. Agriculture and stock raising are the chief occupations. Gold mining is carried on, especially in the west. There are manufactures of Panama hats and of shoes. The department has 510 miles of railway and numerous good highways. Pop., 1912, 292,535. Capital, Pasto (qv). A large portion of the territory assigned to this department by Colombia is still in dispute with Ecuador.

NARIÑO, ANTONIO (1765-1823). A Colombian politician, born in Bogotá. In 1795 he translated and published *The Rights of Man*, for which he was arrested and deported to Spain. He escaped to France and England, where he came in contact with Sá de Miranda (qv), returning to New Granada in 1797. During the revolutionary movement he advocated a centralized government and was named Dictator by Congress in 1811. He struggled against the Federalists, but was defeated by Congress, which had espoused this cause. Nariño thereupon resigned, but was reinstated by the citizens of the capital and was again proclaimed Dictator (September, 1812). Civil war broke out, Nariño was defeated, and then came to terms with Congress in order to repel the forces of the new Viceroy, Marshal Montalvo (1813). Having resigned the dictatorship, he was placed in command of the Patriot army. Successful at first, he met reverses, his army was scattered, and he was taken prisoner and sent in irons to Spain (1814).

NARNI, ná'rñé. An episcopal town in the Province of Perugia, Italy, on the Nera, 1180 feet above the sea and 45 miles north of Rome (Map: Italy, D 3). Ruins of a massive marble bridge built by Augustus and of a very ancient aqueduct are still to be seen. Narni has been the seat of a bishopric since 360, its cathedral of St. Juvenalis dates from the thirteenth century. Other buildings include old churches

dating from the ninth to the fifteenth century, the castle, now used as a prison, old houses, and the town hall with a finely sculptured façade. Calcium, leather, rubber, and olive oil are produced. Narni, the ancient Nequinum, was colonized by the Romans about 300 B.C. The Emperor Nerva was born here. Pop. (commune), 1901, 12,725, 1911, 12,943.

NARO, ná'ró. A town in the Province of Girgenti, Sicily, situated at an altitude of 1945 feet above the river Naro, 12 miles east of Girgenti (Map Italy, D 6). It has a sixteenth-century castle of the Chiaramonti and remains of catacombs, grottoes, aqueducts, and other antiquities. There are large sulphur pits near by. Pop. (commune), 1901, 12,866; 1911, 13,802.

NAR'RAGAN'SET. A former leading Algonquian tribe of New England, occupying most of the territory along the western shore of the bay of the same name, in Rhode Island, and claiming dominion over several smaller tribes of the interior and the islands, including Long Island. They befriended Roger Williams, and through his influence refused to join in the Pequot War. In King Philip's War the Narraganset took a leading part under their chief Canonius. In the celebrated "Swamp Fight" they lost nearly 1000 in killed and prisoners. Canonius himself was killed soon afterward. Those who surrendered at the close of the war were settled among their former tributaries, the Niantic (qv), the whole body thenceforth being known as Narraganset. There were but 16 individuals in 1910. See MOHEGAN.

NARRAGANSETT BAY. An inlet of the Atlantic Ocean, extending into Rhode Island (Map Rhode Island, C 3). It is about 26 miles long, from its entrance to its north extremity (the mouth of the Providence River), and about 4½ miles wide at its mouth, while its maximum width is about 8 miles. It receives the waters of several small rivers, such as the Taunton, and the Pawtuxet, and contains a number of islands, of which Rhode Island (qv), Prudence, and Conanicut (qv) are the largest. At the head of the bay lies the city of Providence, and Newport is situated near its entrance, on the east shore. Consult E. M. Bacon, *Narragansett Bay* (New York, 1904).

NARRAGANSETT PIER. A noted watering place in Washington Co., R. I., 9 miles from Kingston Station, where a branch line connects with the New York, New Haven, and Hartford Railroad (Map Rhode Island, C 4). It is delightfully situated near the mouth of Narragansett Bay and has a fine beach and splendid drives. Among other attractions of the resort are its scenery, Narragansett Heights in particular commanding an extended view, and the beautifully colored rocks in the vicinity, which are picturesque also in form. There are a number of handsome summer residences and many hotels. Pop. (Narragansett District), 1900, 1523; 1910, 1250. The first settler came to this neighborhood about 1675, and in 1815 the pier from which the place takes its name was built. It was not until after 1876, when a railroad was completed to this point, that "the Pier" became a favorite summer resort. Near by, in December, 1675, General Winslow, at the head of 1000 colonists, defeated the Narraganset Indians, of whom 300 were killed and about 600 captured, while the whites lost 80 killed and 150 wounded.

NARRENSCHIFF, nár'ren-shif, DAS (Ger., The Ship of Fools). The most celebrated work of Sebastian Brant (q.v.).

NARSES, nár'séz (c.477-c.572). A celebrated eunuch statesman and general of the Byzantine Empire. He was an Armenian by birth and may have been sold as a slave in childhood. He rose by successive steps to the post of grand chamberlain to the Emperor Justinian. In 532 he aided in suppressing the Nika riot. In 538 he was sent to Italy to act in concert with Belisarius (q.v.) in the war against the Goths. After gaining some successes Narses came into conflict with Belisarius and was recalled to Constantinople in 539. After Belisarius had been recalled Narses was appointed, in 551, to the chief command in Italy. Near Tagina in 552, after a desperate engagement, the Goths were totally defeated and their King, Totila, slain. In the following year Teja (q.v.) was defeated near Sorrento. Narses took possession of Rome, and completely extinguished the Gothic power in Italy. He was appointed prefect of Italy in 554. He fixed his court at Ravenna, and continued till the death of Justinian in 565 to administer the affairs of Italy with vigor and ability. The only blot on the character of his administration is the avarice with which he is charged by his contemporaries. His exactions pressed heavily on the exhausted resources of the population, though their severity may be in some degree palliated by the splendor and utility of the public works on which he partly expended the public revenues. The Romans, on the accession of Justin, complained of the exactions of Narses, and he was recalled. He is accused of intriguing with Alboin, King of the Lombards, to incite an invasion of Italy. This account is improbable, and is not mentioned by any contemporary. Consult: J. B. Bury, *Later Roman Empire*, vol. 1 (New York, 1889); Thomas Hodgkin, *Italy and her Invaders*, vols. iv, v (Oxford, 1885, 1895); Edward Gibbon, *Decline and Fall of the Roman Empire*, edited by J. B. Bury, vols. iv, v (London, 1898); *Cambridge Medieval History*, vol. 11 (New York, 1913). See GOTHIS, JUSTINIAN.

NAR'THEX (Lat., from Gk. *νάρθηξ*, *narthēx*, casket, a sort of tall, hollow-stalked, pithy, umbelliferous plant). A vestibule to a basilica or church, usually extending across the entrance end, either just inside or outside the entrance and façade. The term is used especially of Early Christian and Byzantine architecture, the corresponding part in the West being usually called portico or porch. There were sometimes an *inner* narthex, forming an integral portion of the interior, within the main façade, and an *outer* narthex, attached to the outside of the façade, or with a separate façade. The outer narthex sometimes formed one of the arcades surrounding the atrium. See ATRIUM, BASILICA, CHURCH.

NARUSZEWICZ, nár'ró-shá'vich, ADAM STANISLAW (1733-96). A Polish historian and poet, born at Pinsk, Lithuania. He joined the Jesuits in 1748 and was sent by them to France to complete his education. On his return he became professor of Latin at the Vilna Academy. A second journey through France, Germany, and Italy secured for him the directorship of the Collegium Nobilium at Warsaw. Prince Czartoryski introduced him to King Stanislas Augustus, and the two became inseparable. After the suppression of the Jesuit

Order he became Bishop, first of Smolensk and then of Lutsck. He died at Janow, Galicia. His chief work, *History of the Polish Nation* (6 vols., 1780-86, new ed., 1859-60), was the first scientific treatise of its kind. It is the result of a critical collation of original documents in the Polish and foreign archives, and deals with the period previous to 1386. A firm believer in the monarchical form of government, he aimed in his history to warn his countrymen against their narrow-minded egotism and the lawlessness and arbitrariness of the nobility. These ideas are forcefully expressed in a poem published in pamphlet form, *Voices of the Dead*. He also wrote a *Life of Chodkiewicz* (q.v.) (1781) and a *History of the Crimea* (1787). The *Idylls* (highly sentimental and declamatory) and *Satires* are the best known of his poetic productions, collected as *Lyrica* (Warsaw, 1778 and repeatedly).

NARVA, nar'va. A town, formerly an Estonian fortress, in the Government of St. Petersburg, Russia, situated on the left bank of the river Naróva, about 100 miles west-southwest of St. Petersburg (Map Russia, C 3). The town has several Lutheran and Greek churches. The cathedral contains a fine collection of crosses and crucifixes. Narva has a seventeenth-century town hall, an old castle, two Gynnasia, a theatre, and a number of technical schools attached to the extensive cotton and woolen mills in the vicinity. There is a considerable trade in cotton and lumber. Pop., 1897, 16,577. 1911, 21,478, Germans, Esths, and Russians. The town was founded by the Danes in the thirteenth century, and, after being held for a short time by the Russians, passed to Sweden in 1581. Here, on Nov. 30, 1700, an army of about 40,000 Russians under Peter the Great was completely defeated by some 8,000 Swedes under Charles XII. In 1704 Peter the Great made himself master of the town.

NARVACÁN, nar'va-kan'. A town of north Luzon, Philippines, in the Province of Ilocos Sur (Map Philippine Islands, C 2). It is situated on the main road, a short distance from the coast and about 13 miles southeast of Vigan. Pop., 1903, 19,575.

NARVÁEZ, nár-va'áth, PÁNFILO DE (c. 1480-1528). A Spanish soldier and conquistador. He was born in Valladolid, came to America about 1498, and became lieutenant to the Governor of Cuba, Velazquez. In 1520 Narváez was sent with a body of soldiers to reduce Cortés, then in Mexico to submission. Landing at San Juan de Ulúa, he was surprised one dark night (May, 1520) and seized in his camp by a party under Cortés himself, who then persuaded the soldiers to join in the conquest of Mexico. After about two years of imprisonment at Vera Cruz, Narváez was permitted to return to Spain. There he secured permission to conquer and govern the territory from Florida to the Río de Palmas (Pánuco River). He sailed from San Lucar, June 17, 1527, with a fleet carrying 600 colonists and soldiers, priests, and negro slaves, with a few women. Stopping at Santo Domingo for horses and supplies, about a quarter of his men deserted in order to join in the exodus towards Mexico and Peru. Thence he went to Santiago de Cuba, where he passed the winter, and on Feb. 20, 1528, he set sail for Florida. On April 14 he anchored near a bay, which he named Bahía de la Cruz (variously identified with Clearwater Bay, Tampa

Bay, and Appalachee Bay) On account of the poor condition of the country Narváez, with 300 men, set out May 1 to march through the country, while the vessels were to follow the shore as far as the harbor of Pánuco Hopelessly misled by Indian guides, lost in the tangled morasses, hungry and footsore, helpless against the harrying, pestering attacks of unseen natives, the Spaniards struggled along across the country and finally reached a little harbor on Appalachee Bay, which Narváez named Bahía de Caballos Here from scanty materials they constructed five rude boats, in which the 242 survivors embarked on September 22 to follow the coast westward. When passing the Mississippi the boats were driven to sea by the current and two of them were lost. A storm arose and Narváez disappeared The survivors of the two remaining boats were cast ashore on an island outside Matagorda Bay (November 6) For the fate of the survivors, see NÚÑEZ CABEZA DE VACA, ALVAR Consult: J. G. Shea, *The Catholic Church in the United States* (2 vols., New York, 1890-92), Woodbury Lowery, *Spanish Settlements within the Present Limits of the United States, 1513-1561* (ib., 1901), E. G. Bourne, *Spain in America* (ib., 1907). Alvar Núñez Cabeza de Vaca, "Relación," in J. F. Jameson (ed.), *Original Narratives of Early American History*, vol. II (ib., 1907)

NARVÁEZ, RAMÓN MARÍA, DUKE OF VALENCIA (1800-68) A Spanish general and statesman, born at Loja in Andalusia In early youth he fought in the war of liberation against the French and in 1822 acted with the Liberals and contributed to the suppression of the revolt in the Royal Guards He withdrew to Loja in 1823 upon the triumph of the Reactionary party, and lived there in retirement until the death of Ferdinand VII in 1833 He was engaged in the Basque Provinces in 1834, then commanded a division under Espartero, and in November, 1836, routed the Carlist leader, Gómez, near Arcos In 1838 he cleared the District of La Mancha of brigands, and was appointed, in 1840, captain general of Old Castile and general in chief of the army of reserve He took part in the insurrection against Espartero that broke out at Seville in 1840, but was compelled to flee to France He succeeded in 1843 in bringing about the overthrow of the government of Espartero, and was made President of the Council and field marshal, and was created a grandee of Spain of the first class and Duke of Valencia in 1845 He entered upon a thoroughly reactionary policy and revised the Liberal constitution of 1837 Petty insurrections broke out, which the rigorous soldier-statesman repressed with an iron hand But his dictatorial manners alienated even his personal friends, and his ministry was overthrown (Feb. 10, 1846) After serving as special Ambassador at the French court he returned to power in 1847, but soon afterward quarreled with Queen Christina, and retired from office in 1851 In 1856, on the overthrow of the O'Donnell ministry, he again became President of the Council Intrigues of the court compelled his resignation in 1857 Once more in power in 1864, he was succeeded in the following year by O'Donnell, with whom he suppressed, in 1866, a military revolt in Madrid He supplanted O'Donnell in the same year, and, despite the efforts of O'Donnell and Prim, retained power until his death, April 23, 1868.

NARVIK, nár'vik A town on the west coast of Norway, at the inner end of Ofotfjord, surrounded by beautiful woods and lofty mountains, with a large, deep harbor The town dates from 1892, when it became the western terminal, the most northern railroad terminal in the world, for Luleå Ofoten Railroad, opened 1902 to carry the huge quantities of iron ore from northern Sweden to the Atlantic coast. The export of Swedish iron ore from Narvik, mainly in Swedish ships, was, in 1911, 2,466,415 tons, in 1914, 3,000,000 tons Through the Ofoten Railroad it has connections with the railroads of Sweden A Narvik-Tromsø railroad is planned The town has steamship connections with other coast towns It exports fresh fish to Sweden, and has schools and newspapers. Pop., 1898, 50. 1910, 4643

NARWHAL, nár'wal (from Swed., *Dan nahial*, Icel *nahialr*, probably from Icel *nar*, coipse + *hial*, whale, so called from the pale

SKULL OF NARWHAL

The lower jaw has been removed, and the view is of the root of the mouth, which has been partly cut away to show the deep insertion of the root of the tusk (on the left-hand side) and the abortive tooth on the right-hand side of the upper jaw

color of the skin) A cetacean of the family Belugidae, resembling the white whale in form and in the want of a dorsal fin, but remarkably characterized by having no teeth except two in the upper jaw, supposed to be canines, one and occasionally both of which (in the male) develop into spirally twisted straight tusks passing through the upper lip and projecting like horns in front When, as usually, only one is so produced, it is always the left one Only one species is known (*Monodon monoceros*), of Arctic seas, where narwhals are often seen in great numbers among the ice fields and in the creeks and bays, always active and playful A mature narwhal is generally about 15 feet in length, besides the tusk, which is from 6 to 10 feet long. The tusk is hollow nearly to the point, and is spirally grooved. Its use is rather conjectured than known, it is probably a weapon of defense, but it may also be used for breaking thin ice in order to breathe, and for killing fish The remains of skates and other flatfish have been found in the stomach of a narwhal, and it is not easy to imagine how a toothless animal, with rather small lips, could capture and swallow such prey unless the formidable tusk were first employed. Cephalopod mollusks, however,

are believed to constitute a principal part of the food. The narwhal is pursued by the Eskimo for food and for the sake of its blubber, with which the whole body is invested to the thickness of about 3 inches, weighing nearly half a ton and yielding a large amount of excellent oil. The tusks are also valuable, as they are denser, harder, and whiter than ivory. The kings of Denmark have long possessed a magnificent throne of this material, preserved in the castle of Rosenberg. Great medicinal virtues were formerly ascribed to the tusks. The animal has been called the sea unicorn.

NA'SAL CATARRH. See RHINITIS

NASAL DISEASE. See NOSE, *Diseases of*

NASAL INDEX. See INDEX.

NASALS (Fr., Sp., Portug *nasal*, It. *nasale*, adapted from ML. *nasalis*, of the nose, Lat *nasus*, nose). A name applied to consonant sounds, such as *m*, *n*, whose quality is affected by the deflection of the breath from the oral to the nasal passages. The voice is made to pass through the nose by relaxation or dropping of the palatal veil that shuts it off from the pharynx. When the nasal sound is uttered with complete closure of the oral passage, it is called a nasal stop or click or mute, or most frequently a nasal merely, such as English *n*, *m*, or *ng*, uttered in the mouth positions of *d*, *b*, *g* respectively. There may be in a language as many such sounds as there are positions of the mute closure. In Sanskrit, e.g., as many as five kinds of nasals have been noted. In English, French, or German, phoneticians distinguish four classes of these sounds: the *back* or *velar* nasal, of which the place of articulation is the middle of the soft palate, except before the front vowels, when it is farther forward, between the soft and hard palate. It is written *ng* or *nh* in English and German, thus, *finger*, *thank*, *lange*, *denken*. While in French it is not recognized as an independent sound, there is a palatal nasal formed farther back than the line between the hard and soft palate which is very similar to it, thus, *régner*, *Cologne*. This is called the *front* or *palatal* nasal. The stoppage of the *teeth* or *dental* nasal is the same as for *d* or *t* in the three languages mentioned. Thus, English *hunt*, *manner*; German *nein*, *nennen*, French *neuf*, *bonne*. In French, however, when final and before a consonant, the *n*, together with the preceding vowel, indicates a nasal vowel, i.e., it is uttered in the same position of the mouth organs as a vowel, thus, *un*. These French nasal vowels, of which four are usually indicated (*an*, *on*, *in*, *un*), are distinguished from similar vowels in other languages by the fact that the velum or soft palate is but slightly relaxed during the emission of the sound. The Portuguese nasals, written *ã*, *ão*, *ê*, *õe*, *am*, *em*, *im*, *om*, *um*, are all produced in the position of vowels. Finally, the *lip* or *labial* nasal is uttered in the bilabial position of *b*, *p* in English, German, and French, thus, English *my*, *summer*; German *nein*, *kommen*, French *mon*, *blâmer*. In French again it may have the value of a nasal vowel, as in *commencer*. All of these nasals may be voiceless, especially before a voiceless sound, as in English *length*, *sneer*, *lamp*. Nasal semivowels may also be produced in certain positions. The entire utterance may even be rendered more or less nasal by an habitual dropping of the palatal veil. This is noticeable in certain pronunciations of English in America and Spanish in Spain. It is popularly known

as the nasal twang. Consult: Jean Rousselot, *Principes de phonétique expérimentale* (2 vols., Paris, 1901-08); K. A. Viëtor, *Elements of Phonetics, English, French, and German*, translated by Rippmann (London, 1910); Walter Rippmann, *The Sounds of Spoken English* (ib., 1910); Roudet, *Eléments de phonétique générale* (Paris, 1910); P. E. Passy, *Les sons du français* (ib., 1913). See MUTES.

NAS'ARÆ'ANS. According to Epiphanius, a Jewish sect, living in Galæaditis, Basinitis, and the region beyond the Jordan, which existed before Christ and did not know Christ. It has been supposed by some scholars that Epiphanius either himself assumed a distinction between these sectaries and the Nazareans (q.v.) which in reality did not exist or that he misunderstood a passage in Apollinaris of Laodicea. But there seems to be no convincing reason for thinking of a confusion on the part of Epiphanius. The recent discovery of the Jewish sect of the Covenanters of Damascus (see ZADOKITES) shows that in the same region where the Nasareans are said to have lived there were dissenting bodies of the kind described. In fact, the emphasis upon the hope of a Messiah from Israel and Aaron, not from Judah and David (see MESSIAH), may have given rise to a Jessæan sect, insisting upon the origin of the Messiah in the branch from the roots of Jesse (Isa xi 1), and the Hebrew word for "branch" (*neser*) is likely to have furnished the name Nasareans. Consult Gustav Hoenicke, *Das Judentum im ersten und zweiten Jahrhundert* (Berlin, 1908), and Schmidke, *Neue Untersuchungen zu den jüdenchristlichen Evangelien* (ib., 1913).

NAS'BY, PETROLEUM V (ESUVIUS). The pseudonym of the American humorist David Ross Locke (q.v.).

NASCAPI, nās'ca-pē, or **NASCAPEE**. The most northeasterly tribe of the Algonquian stock (q.v.), occupying the interior highland region of Quebec and Labrador, northward almost to Ungava Bay. They are closely allied by intermarriage with the Montagnais (q.v.) and trade at the same stations along the St. Lawrence. They depend entirely upon hunting and fishing for subsistence and are still but little changed from their primitive condition. They are supposed to number altogether about 3200 souls. Consult L. M. Turner, in *Bureau of American Ethnology, Eleventh Annual Report* (Washington, 1894).

NAS'CENT STATE (from Lat *nascens*, pres. p. of *nasci*, to be born), *status nascendi*. The state in which a chemical element exists at the instant of its liberation from a compound. The reacting capacity of an element in the nascent state is far greater than in the ordinary state, i.e., some time after it has been liberated. For example, in the gaseous state hydrogen has no action upon ordinary aldehyde, but when sodium amalgam is brought in contact with an aqueous solution of aldehyde, the latter combines directly with the nascent hydrogen, yielding ordinary alcohol. According to most authors, nascent hydrogen is made up of single atoms, while gaseous hydrogen is made up of molecules, each of which consists of two atoms. Others believe that nascent hydrogen is nothing but highly compressed gaseous hydrogen, for, as a matter of fact, it has been shown that highly compressed hydrogen is capable of acting in many respects like nascent hydrogen, and it can also

be shown that hydrogen is chemically liberated with considerable pressure. Similar remarks apply also to other elements in the nascent state.

NASCIMENTO, năs'sé-măn'tô, FRANCISCO MANOEL DO (1734-1819). A Portuguese poet and a secular priest. Summoned to appear before the Inquisition because of certain heterodox practices, he fled to Holland and then to France, where he spent the rest of his life. While in Portugal, Nascimento formed with some seceders from the Arcadia a counter poetical academy (the Grupo da Ribeira das Naos), whose members observed the Arcadian system of taking pseudonyms, so that he is known as Niceno and Filinto Elysio. At Paris (1817-19) and at Lisbon (22 vols., 1836-40) there appeared two separate editions of his *Obras completas*, neither of which is really complete, but the latter of which is the more useful. Consult Innocencio da Silva, *Diccionario bibliographico Portuguez*, vols. ii, ix (Lisbon, 1858, 1870). Pereira da Silva, *Filinto Elysio e a sua epoca* (Rio, 1891); Theophilo Biaga, *Filinto Elysio* (Oporto, 1891).

NASEBERRY. See CHEWING GUM.

NASEBY, năz/bî. A parish of Northamptonshire, England, 12 miles east by north of Rugby. Pop., under 750. It gives its name to the decisive action of the Civil War between Charles I and the Parliamentary army under Fairfax and Cromwell, which took place here June 14, 1645. The New Model army of the Parliamentarians, numbering about 13,000 men, totally defeated nearly 10,000 Royalists, about 1,000 of the latter were killed, and 5,000 were taken prisoners, nearly all the Royalist arms and ammunition were also captured.

NASH, ABNER (1716-86). An American official, brother of Gen. Francis Nash (q.v.). He was born in Prince Edward Co., Va., but removed to North Carolina, was admitted to the bar, and gained a large practice. He represented Newbern in the First Provincial Congress held in that town in 1774, and the next year was a member of the Provincial Council. He was a member of the body which framed the State constitution in 1776 and was the Speaker of the first House of Commons the next year. In 1780 he was elected the second Governor of the State. His administration was stormy, as the Legislature gave most of his powers to a board of war, and he served but one year. In 1782 and 1785 he represented Jones County in the Legislature and was elected by that body a delegate to the Continental Congress in 1782-84 and 1785-86.

NASH, CHARLES WILLIAM (1848-) A Canadian ornithologist, born in the County of Sussex, England, and educated at the Shoreham Grammar School and in the island of Jersey. He went to Canada, studied law, and was admitted to the Manitoba bar (1883), but in 1899 entered the Department of Agriculture, Ontario, and was appointed lecturer on biology by the Farmers' Institute Bureau. Besides serving as associate editor of the *Farming World*, he published *Birds of the Garden*, *Wild Fowl of Ontario*; *Cheek List Birds of Ontario*; *Game Fishes of Ontario*; *Humming Birds of Ontario*; and many other similar works, also *Birds of Ontario in Relation to Agriculture* (1898; 3d ed. 1904).

NASH, FRANCIS (1720-77). An American soldier, born in Prince Edward Co., Va. At an early age he removed to Orange Co., N. C. In 1771 he served as a captain under Governor

Tryon in the campaign against the Regulators (q.v.). He was a member of the Assembly in 1771 and from 1773 to 1775. He was also a member of the Provincial Congress of 1775 and by it was commissioned lieutenant colonel of the First North Carolina Regiment in September and promoted to be colonel April 22, 1776. This regiment became a part of the Continental line, and in February, 1777, he was made brigadier general. At Germantown his brigade, which was intended to form part of the reserve, participated in some of the hottest fighting of the day. General Nash was mortally wounded by a cannon ball and was buried at Kulpsville.

NASH, HENRY SYLVESTER (1854-1912). An American Protestant Episcopal theologian, born in Ohio. He graduated from Harvard University in 1878. At the Episcopal Theological School, Cambridge, where he graduated in 1881, he held the chair of literature and interpretation of the New Testament from 1884 to his death. His publications include *The Genesis of the Social Conscience* (1897), *Ethics and Revelation* (1899), *The History of the Higher Criticism of the New Testament* (1900, new ed., 1906), *The Atoning Life* (1908).

NASH, SIR JOHN (1752-1835). An English architect, born in London. He was a pupil of Sir Robert Taylor. After some years spent in building speculations he began practice in London in 1792 and speedily rose to eminence. He designed numerous mansions, but is chiefly celebrated in connection with the great street improvements in London, especially in the Marylebone region, which he helped to transform into Regent's Park. Regent Street, Haymarket Theatre, Langham Place Church, Park Square, the terraces in Regent's Park, and Buckingham Palace (recently altered) are specimens of his designs. The pavilion at Brighton is another of his works. He died at East Cowes, Isle of Wight, May 13, 1835.

NASH, JOSEPH (1809-78). An English water-color painter and lithographer, born at Great Marlow, Buckinghamshire. He studied architecture under the elder Pugin and contributed drawings to the latter's *Paris and its Environs*. He is principally known by his water colors and lithographs illustrating late Gothic domestic architecture and interiors. His publications include *Architecture of the Middle Ages* (1838) and *Mansions of England in the Olden Time* (1839-49, new ed., 1906). His accurate draftsmanship and his knowledge of composition and of the value of light and shade have caused these works to be greatly prized by architects. The figures introduced to illustrate the costumes and habits of the period add greatly to their interest. He also did a series of views of Windsor Castle. There are numerous sketches by him in the South Kensington Museum.

NASH, RICHARD (1674-1762). An English society leader, better known as Beau Nash, born at Swansea. In 1692 he entered Jesus College, Oxford, but he left before finishing his course and, after a very brief career in the army, entered as a student of law at the Inner Temple in 1693. There he quickly became conspicuous for his good manners, his taste in dress, and his high living. His income being insufficient to meet his demands, he eked it out by gambling and by performing for large wagers such risqué exploits as riding naked through a village on a cow. It was the former occupation that in 1705 took him to Bath, then newly become a fashion-

able watering place. Here was his opportunity. Bath was then a rude little village filled to overflowing with fashionable people who were compelled to pay extravagant rates for miserable lodgings, whose only dancing place was the bowling green, and whose card and tea rooms were canvas tents. Nash set himself to change all this, and in a short time he had succeeded not only in building an assembly house, in procuring decent lodgings, and in reducing the insolent sedan-chair men to humility, but also in making himself the social autocrat of the place. He drew up a set of rules which were enforced on high and low, he practically abolished dueling, and he even assumed the duty of improving the country roads in the neighborhood. During these years his income, principally derived from his partnership in gambling houses and his own skill as a gamester, was large, and he lived in a style befitting "the King of Bath." But in 1740 gambling came under the ban of the law, and, though Nash managed for a time to evade yielding obedience, new regulations in 1745 left him practically without resources. In this plight the town, which owed so much to him, came to his rescue with a pension of £10 a month, and on this he lived until his death. Nash owed but little of his popularity to physical attraction, for, according to Goldsmith, he was large and clumsy, and his features were "harsh, strong, and peculiarly irregular." But he did have "assiduity, flattery, fine clothes, and as much wit as the ladies he addressed." Consult Goldsmith, *Life of Richard Nash* (London, 1762), and Clare Jerrold, *Beau and the Dandies* (New York, 1910).

NASH, THOMAS (1567-1601). An English author, born at Lowestoft, Suffolk, in 1567. He graduated B.A. from St. John's College, Cambridge, in 1586, traveled in France and Italy, settled in London as an author in 1588, and died obscurely in 1601. His first publication was a sharp review of the state of letters, prefixed to Greene's *Menaphon* (1589). It was followed by a pamphlet in similar vein entitled *Anatomic of Absurdities* (1589). Nash now entered the Martin Marprelate controversy (q.v.), writing abusive satires on the Puritans. He also violently attacked Gabriel Harvey in *Have with you to Suffon Walden* (1596). Of more general interest are his satirical sketches of contemporary manners *Pierce Pennilesse, his Supplication to the Dwelt* (1592), *The Terrors of the Night* (1594), *Lenten Stuff* (1599), the picaresque novel called *The Unfortunate Traveler, or Jack Wilton* (1594). This last work was the sternest piece of realism that had yet appeared in English fiction. Nash also wrote a comedy entitled *Summers Last Will and Testament* (printed 1600) and had a hand with Marlowe in *The Tragedy of Queen Dido* (printed 1594). Nash was given to outright speech and sarcastic mirth. He was well read and avowed himself the disciple of Pietro Aretino. He also knew Brant's *Narrenschiff* and the works of Rabelais, a flavor of which is perceptible in him, as well as English poets, such as Surrey and Spenser. Izaak Walton aptly described Nash as "the master of a scoffing, satirical, and merry pen." Consult his *Complete Works*, edited by Grosart (6 vols, London, 1883-85).

NASHUA, năsh'û-a. An important manufacturing city and the county seat of Hillsboro Co., N. H., 40 miles northwest of Boston, Mass.,

on the Nashua River, near its junction with the Merrimac, and on several divisions of the Boston and Maine Railroad (Map: New Hampshire, G 8). It has a public library, a United States Fish Hatchery, Memorial and St. Joseph's hospitals, the Hunt Home, Nashua Sanitarium, fine courthouse and post-office buildings, and a park system comprising 200 acres. A canal, 3 miles long, 60 feet wide, and 8 feet deep, leading from the Nashua River, furnishes excellent water power for large cotton mills. The manufactures include iron and steel, stationary engines, edge tools, furniture, cotton goods, cards and glazed paper, shoes, refrigerators, ice-cream freezers, registers, sash, doors, and blinds, kits and caskets, overalls, boxes, saddlery and hardware, shears and clippers, etc. Nashua is also the distributing centre for a large agricultural district. A modified form of commission government was adopted in 1914. Pop., 1900, 23,898; 1910, 26,005; 1914 (U. S. est.), 26,901. Settled in 1655, Nashua was incorporated as the township of Dunstable by Massachusetts in 1673, was reincorporated by New Hampshire in 1746, received its present name in 1836, and was chartered as a city in 1853. Consult E. E. Parker, *History of the City of Nashua, N. H.* (Nashua, 1897).

NASHVILLE. The capital of Tennessee, and next to Memphis its largest city, and the county seat of Davidson County, on the Cumberland River (mainly on the left bank), 233 miles east-northeast of Memphis and 186 miles south by west of Louisville, Ky., on the Louisville and Nashville, the Nashville, Chattanooga, and St. Louis, and the Tennessee Central railroads (Map: Tennessee, D 2). It has an area of about 182 square miles and is regularly laid out on gradually rising ground, which reaches an elevation of 650 feet above sea level. There are two electric interurban railways. Macadam, bituminous, and wooden blocks are very largely used in the pavement of streets, about 190 out of a total of 275 miles being laid with these materials. There are a number of handsome structures. The State capitol, situated on a hill, cost \$1,500,000 and is the most imposing building in the city. The grounds contain the tomb of James K. Polk and a statue of Andrew Jackson. Among other notable public edifices are the United States government building, the courthouse, the city hall, the Tennessee School for the Blind, the Galloway Memorial Hospital, St. Thomas's Hospital, the State penitentiary, and the Parthenon. The Tennessee Industrial School and the Tennessee Reformatory for Boys are at Nashville, and about 6 miles away is the State lunatic asylum. The Hermitage, of historic interest as the home of Andrew Jackson, is some 10 miles to the east. The national cemetery, a short distance north of the city, has 16,643 graves, 4711 of unknown dead.

Nashville is one of the most prominent educational centres in the South. It is the seat of Vanderbilt University (q.v.); Peabody College for Teachers (q.v.); Knapp School of Farm Life; Meharry Medical College (colored); Walden University (Methodist Episcopal), opened in 1866 (colored); Fisk University (q.v.) (colored); Roger Williams University (Baptist), opened in 1865 (colored); Boscobel College, for women (Baptist), opened in 1889; Ward-Belmont College, for women (Presbyterian), opened in 1865; St. Cecilia Academy, for women, founded in 1860 (Catholic); and Buford Col-

lege for Women, opened in 1900. The State library comprises 40,000 volumes, and Watkins Institute, the repository of the collections of the State Historical Society, has the Howard Library of 10,000 volumes and conducts a large night school. The Carnegie Library consists of 94,000 volumes. Nashville ranks second in the State as an industrial city, its 584 manufacturing establishments in 1915 having an aggregate capital of \$41,000,000 and a production valued at \$45,000,000. First in importance is the manufacture of flour and grist-mill products, the city being the chief centre of this industry in Tennessee. There are also large printing and publishing houses and extensive manufactories of lumber and planing-mill products, stoves, clothing, tobacco, boots and shoes, fertilizers, etc. Nashville controls a large trade in lumber, cotton, grain, and manufactured goods and, as the distributing centre for a considerable area, has important wholesale interests in groceries, dry goods, drugs, and boots and shoes.

The government, under the charter of 1913, is vested in a commission of five members, who are elected for a term of four years, two are elected at one time, and the other three are chosen two years later. The commission has administrative and legislative powers. This body also selects the members of boards which govern hospitals, charities, and schools, and the tax assessor and city attorney. The judge of the city court is elected by the people. The city's budget cannot exceed the amount of revenue collected during the preceding year. Nashville spent in 1914, in maintenance and operation, about \$2,300,000, the principal items of expenditure being \$498,091 for education, \$277,097 for water works, \$172,730 for the police department, \$176,476 for the fire department, and \$198,000 for interest on the debt. In addition to the ordinary expenses there was expended out of proceeds of sales of bonds and special assessments \$705,000 for permanent improvements, new parks, streets, sidewalks, etc. The water works are owned by the municipality, were built in 1832, and rebuilt in 1886. The system now comprises 197 miles of mains. There is a municipal electric-light plant. Pop., 1830, 5566, 1850, 10,165, 1870, 25,865; 1890, 76,168, 1900, 80,865, 1910, 110,364, including 2993 persons of foreign birth and 36,523 negroes; 1914 (U. S. est.), 114,899.

Nashville was first settled in 1780 by a company of pioneers led by James Robertson and, in honor of Gov. Abner Nash of North Carolina, was called Nashborough until 1784, when it was incorporated as a town under its present name. Throughout its early years the settlement was almost continually harassed by the Indians, and on April 2, 1783, a large body of Cherokees made a determined but unsuccessful attack. Nashville was chartered as a city in 1806, was the seat of the State Legislature in 1812-15 and again from 1826 to 1843, and became the permanent State capital in 1843. It was occupied by a Federal army in 1862 and in 1864 was the scene of a hotly contested battle. (See NASHVILLE, BATTLE OF). Many well-known men, including Andrew Jackson, James K. Polk, Gen. Sam Houston, and Thomas H. Benton, made Nashville their home for the whole or a part of their lives. Consult L. P. Powell (ed.), *Historic Towns of the Southern States* (New York, 1900), and L. P. Elliot, *Early History of Nashville* (Nashville, 1911).

NASHVILLE, BATTLE OF. A battle of the Civil War in America, fought south of Nashville, Tenn., Dec. 15 and 16, 1864, between a Federal army in the command of Gen. George H. Thomas and the Army of Tennessee under Gen. John B. Hood.

When General Hood evacuated Atlanta early in September, he moved west into Alabama, hoping to draw General Sherman after him and carry the war back into Tennessee. General Sherman, however, sent General Thomas and a part of his army to oppose General Hood, while he undertook the March to the Sea. General Thomas proceeded to Nashville and assembled the Fourth Corps of the Army of the Cumberland under General Wood, the Twenty-third Corps, Army of the Ohio, under General Schofield, the First and Third Divisions, Army of the Tennessee, under Gen. A. J. Smith, a provisional division including two brigades of colored troops under Gen. J. B. Steedman, and the cavalry corps under Gen. James H. Wilson, about 55,000 in all. General Hood advancing northward into Tennessee was repulsed at Franklin, November 30, by General Schofield, who at once retired within the intrenchments at Nashville. On December 2 General Hood appeared before Nashville and offered battle. General Thomas, feeling that his army was not sufficiently unified, delayed, though ordered to fight at once by the authorities at Washington. On December 15 he advanced from his intrenchments. The cavalry was placed upon the right of a great curve, the Sixteenth Corps next, the Fourth Corps was the centre and the pivot, the Twenty-third Corps, as a reserve, was to the left, and the Provisional Division was at the extreme left. General Steedman attacked Cheatham's corps on the Confederate right, but was repulsed, but Gen. S. D. Lee in the centre and General Stewart on the left were driven back and some unfinished works captured. Late in the day General Schofield with the Twenty-third Corps was moved to the Federal right. During the night General Hood formed Cheatham's corps on the left. No change was made in the Federal disposition. On the morning of December 16 the Fourth Corps made an unsuccessful attack on Overton's Hill on the Confederate right, but Cleburne's old division was transferred from the left to strengthen the right. General McArthur, of the Sixteenth Corps, assaulted General Bate's division on the Confederate left and pierced the line. At this moment some of Hatch's cavalry, which had made a long detour, attacked the Confederate rear, and soon the retreat became a rout along the whole line. General Forrest with the Confederate cavalry came up and covered the rear. General Hood with the fragments of his army retreated across the Tennessee River, and on Jan. 14, 1865, asked to be relieved from command. The Federal troops actually engaged numbered about 45,000, the Confederate about 25,000. The Federal forces lost in killed, wounded, and missing 3057. The Confederate losses in killed and wounded were not given, but 4462 were taken prisoners. Consult J. W. De Peyster, *Nashville, the Decisive Battle of the Rebellion* (New York, 1876); Hood, *Advance and Retreat* (New Orleans, 1880); J. D. Cox, *March to the Sea* (New York, 1882); Johnson and Buel (eds.), *Battles and Leaders of the Civil War* (ib., 1887); Steele, *American Campaigns* (Washington, 1909).

NASHVILLE, UNIVERSITY OF. An institution of learning, now out of existence. It

donated its grounds and buildings to Peabody College for Teachers (q.v.)

NASIK, nā'sik, or **NASSICK**. The capital of a district of the same name, Bombay, British India, on the Godavari River, 95 miles northeast of Bombay (Map India, B 5). Owing to its proximity to Trimbak, 19 miles distant, the source of the sacred Godavari, Nasik is one of the holy towns of India, and rivals Benares as a place of pilgrimage. It is the chief seat of Brahmanism in the Deccan, housing 1300 Brahman priests and their families. The town is built on both sides of the river, the portion on the right bank, divided into the old and the new town, being spread over three hills, Panchwati, on the left bank, connected by a bridge, contains the principal features of interest. The river is lined with temples, shrines, and ghats for devotional ablutions. The dwellings are mounted on stone piers and are more than ordinarily substantial. Nasik is the chief seat of the copper and brass industry in the province and is noted for its artistic productions: it has also hand manufactures of cotton and paper. Four and a half miles to the south are the celebrated Lena Caves, situated in a conical hill, about 450 feet from its base. They were excavated probably in the second or third century A.D. and contain several rudely sculptured figures, the leading ones representing Buddha. The town is the Nasica of Ptolemy. It was long the capital of a Mahatta principality. Pop., 1901, 21,490. 1911, 33,463.

NASMYTH, nā'smith, JAMES (1808-90). A Scottish engineer and inventor. He was born at Edinburgh, where he received his education at the high school, the school of arts, and the university. As a youth he was an expert mechanic and constructed models of steam engines and other machinery. In 1829 he became assistant to Henry Maudsley, a London engineer, from whom he derived much useful knowledge and experience. In 1834 he began the manufacture of machine tools at Manchester, where his business rapidly increased and developed into the well-known Bridgewater Foundry. In 1839 he invented the steam hammer, which he improved from time to time. He was also the inventor of many important machine tools, including a hydraulic punch and a steam pile driver, and he was the first to propose the use of a submerged chain for towing boats on rivers and canals and of chilled cast-iron shot. In addition to his work as a mechanical engineer he was much interested in astronomy and made many observations with reflecting telescopes which were constructed and mounted according to his ideas. His astronomical work includes investigations of the surface of the sun and moon, which form the subjects of several papers which were published in elaborate form. Consult *James Nasmyth: An Autobiography*, edited by Samuel Smiles (London, 1861-62; new ed., 1895).

NASR ED DIN, nasr ʿed dēn' (1831-96). A shah of Persia. On the death of his father, Mohammed Mirza, Oct. 15, 1848, he ascended the throne. At his accession he found the country in confusion, but by the aid of his Vizier, Mirza Taqi Khan, he established himself firmly and proceeded to carry out numerous reforms. These plans were unfortunately interrupted by the new

Vizier, who was an enemy of all progress. Against the Turkomans and other neighboring peoples Nasr ed Din was successful, but in 1871 the English put a stop to whatever thoughts of further conquest he may have entertained by defining the boundaries between Persia and Afghanistan. The Shah made three tours of Europe—in 1873, 1878, and 1889. This cultured and well-meaning ruler introduced many reforms into his Kingdom, and his long reign of 48 years has but one serious blot on it, the persecution of the Babis. He was assassinated May 1, 1896, and was succeeded by his son, Muzaffar ed Din. Consult Morgan and Burger, *Nasr ed-Din Shah and das moderne Persien* (Dresden, 1889); James Greenfield, *Die Verfassung des persischen Staats* (Berlin, 1904); A. V. W. Jackson, *Persia Past and Present* (New York, 1906).

NASS, nās (properly NASQA, corruptly NISKA). See CHIMESYAN.

NASSAU, Ger. pron nās'sou. Formerly a German duchy, now a part of the Prussian Province of Hesse-Nassau (q.v.). The districts now known by the name of Nassau were anciently occupied by the Alemanni (q.v.). They subsequently became a part of the Frankish realm. After the partition of the Carolingian Empire in the Treaty of Verdun (843) the present Nassau was a part of the Kingdom of Germany and was included in the Duchy of Franconia. About 1100 the Count of Laurenburg built the castle of Nassau, from which his descendant Walram I took the title of Count of Nassau about 1160. In the middle of the thirteenth century Walram's two grandsons, Walram II and Otho, became the founders of two separate lines, ruling respectively in the southern and the northern parts of the country. The descendants of Walram II continued to rule in Nassau until 1866. His son Adolphus was King of Germany from 1292 to 1298. His later descendants established several separate lines, but by the successive extinction of other branches the Nassau-Weilburg family was left as the sole representative in 1816. In 1806 the territories of the line of Nassau-Usingen had been erected into a duchy. In 1836 Nassau joined the Zollverein. Duke Adolphus of Nassau (1839-66) had many difficulties with his subjects, who chafed under his conservative tendencies. He sided with Austria against Prussia in 1866, with the result that Prussia took possession of Nassau. (See GERMANY.) In 1890 the Grand Duchy of Luxemburg passed to the Duke of Nassau.

The younger line of Nassau was founded by Otho I (died about 1292), who in the division with his brother received the northern part of the country. From this line have sprung the stadholders and royal sovereigns of Holland. This junior branch of the house of Nassau acquired possession in 1544 of the Principality of Orange in the person of William the Silent, the great leader of the Dutch in their struggle for independence, who assumed the title of Prince of Orange. With the death of William III of England and Holland in 1702 Orange passed out of the house of Nassau, but the princely title derived from the little state was retained by his successors, and the reigning dynasty in the Netherlands is still styled the house of Orange. Consult Schliephake and Menzel, *Geschichte von Nassau* (7 vols., Wiesbaden, 1865-89).

NASSAU, nās'sā. The capital of the Bahama Islands, situated near the east end of the island

of New Providence (Map: West Indies, C 1) Owing to its salubrious climate, Nassau is a winter resort for invalids, chiefly from the United States. The town is well laid out and has fine public buildings and a cathedral. It has a good harbor, admitting vessels drawing 16 feet. The people are engaged in agriculture and carry on considerable trade in cotton, fruit, sponges, and salt. It is the seat of an Anglican bishop. Pop., 11,000, chiefly negroes. Founded by the English in the seventeenth century, Nassau was destroyed by the French and Spaniards in 1703, but was rebuilt 15 years later. In 1740 it was made a fortified port, open to free trade.

NASSAU, ADOLPH OF. See ADOLPH OF NASSAU.

NASSAU-SIEGEN, nas'sou-zē'gen, JOAN MAURITZ, COUNT and (after 1664) PRINCE VON (1604-79). A Dutch soldier and governor, born at Dillenburg. He early distinguished himself in the service of Holland at the sieges of Breda (1625) and Maasticht (1632). From 1636 to 1642 he was Governor of the Dutch possessions in Brazil. Under his rule the colony was notably prosperous. He defeated the Spanish and Portuguese fleets in 1640, and continued to attack these powers with varying success until his return to Holland (1614). In 1647 he entered the service of Brandenburg, was made Governor of Cleves, and arranged the Treaty of 1661 between Brandenburg and England. Placed at the head of the army of the Netherlands, he defeated the Bishop of Munster (1665). In 1671 he became field marshal, took an active part in the war against Louis XIV in the Spanish Netherlands, and was made Governor of Utrecht (1674). Consult Driesen, *Leben des Fürsten J. Moritz von Nassau Siegen* (Berlin, 1849).

NASSE, nas'se, CHRISTIAN FRIEDRICH (1778-1851). A German physician, born at Bielefeld. He received his medical education in Berlin and Halle (M.D., 1800) and practiced in his native town. The years 1810 to 1815 he spent in Göttingen, Leipzig, Dresden, and Weimar. He then accepted the chair of practical medicine at the University of Halle and was called to a similar chair at Bonn in 1822. Nasse was a strong representative of the new school of medicine, making science, especially scientific diagnosis instead of philosophical speculation, the basis for therapeutical medicine. Among his many works are *Leichenöffnungen*, etc. (1821), *Ueber den Begriff und die Methode der Physiologie* (1826), *Handbuch der speciellen Therapie* (1826-38), *Handbuch der allgemeinen Therapie* (1840-45), *Die Behandlung der Gemüthskranken*, etc. (1844), *Vermischte Schriften*, etc. (1850), *Die Untersuchung des Scheintodes vom wirklichen Tode* (1851).

NASSE, ERWIN (1829-90). A German economist, one of the most prominent representatives of the Socialism of the Chair. He was born and educated at Bonn and became professor at Basel, at Rostock, and at Bonn (1860). From 1869 to 1879 he was a member of the Prussian Lower House and in 1889 was appointed to the House of Peers. One of the founders of the Verein für Sozialpolitik, he was its president from 1874 until his death. His writings, which were marked by unusual clarity of style, include *Bemerkungen über das preussische Steuersystem* (1861); *Die preussische Bank* (1866); *Ueber die mittelalterliche Feldgemeinschaft und die Einhegungen des 16. Jahrhunderts in England* (1869; trans. by Ouvry, 1871), "Agrarische Zu-

stände in England," in *Schriften des Vereins für Sozialpolitik*, vol. xxvii (Leipzig, 1884).

NAS/SICK. A town of India. See NASIK.

NAST, THOMAS (1840-1902). An American illustrator, caricaturist, and painter. He was born at Landau, Bavaria, Sept. 27, 1840, but when six years old was brought by his parents to America. After studying a short time with Theodore Kaufman he was given employment, (though only 14 years old) as a draftsman on *Frank Leslie's Illustrated Newspaper*. He went to England in 1860 and then traveled to Italy to follow Garibaldi, making sketches of the war, which appeared in the *New York Illustrated News*, the *Illustrated London News*, and *Le Monde Illustré*. Returning to America, Nast entered the service of *Harper's Weekly*, for which, during many following years, his best work was done. In 1862 his drawings of scenes from the American Civil War, published in Harper's periodicals, attracted wide attention. Pointed and severe and displaying an unusual power of individual characterization, extending even to articles of clothing, Nast's cartoons did much to break up the corrupt Tweed ring and to bring to swift judgment public men who failed to keep faith. Many of the political symbols and types still in vogue, such as the Tammany tiger, the Republican elephant, and the Democratic donkey, were originated by Nast. He started the publication of *Nast's Illustrated Almanac* in 1872, and illustrated *The Tribute Book*, Nasby's *Sirquin's Round the Cuckle*, and among other works, Dickens's *Pickwick Papers* and *Pictures from Italy*. Not only a fine draftsman but a clever painter, remarkable for celerity and facility of execution, Nast is known for pictures that show a sturdy realism and possess a certain richness of color, but evidence lack of technical training. Among his chief oil paintings are "The Departure of the Seventh Regiment" (1861), "The Civil War," "Lincoln's Visit to Richmond", "Head of Christ," Metropolitan Museum, New York. In 1894 he was called to the *Pall Mall Magazine*, London, and in 1902 he became American Consul General at Guayaquil, Ecuador, where he died December 7 of the same year. Consult A. B. Paine, *Thomas Nast His Period and his Pictures* (New York, 1904), and id., *Life and Letters of Thomas Nast* (ib., 1910).

NAST, WILLIAM (1807-99). An American Methodist Episcopal clergyman, born in Stuttgart, Württemberg, the son of a counselor in the Royal Treasury. He graduated from the University of Tübingen, in the same class with David Friedrich Strauss, came to the United States in 1828, and taught at West Point, Gettysburg, and Kenyon College. In 1835 he entered the Methodist ministry, joining the Ohio conference. He was appointed German missionary at Cincinnati and later at Columbus, founding in the former city (1838) the first German society ever formed in the Methodist Episcopal church. Dr. Nast founded also and edited from 1841 to 1892 *Der christliche Apologete*, the official organ of the German Methodists, later edited by his son Dr. A. J. Nast. The beginnings of the work of the Methodist Episcopal church in Germany may be traced directly to an official visit he made to his native land in 1844. He was a member of a number of General Conferences. Besides translating into German Wesley's *Sermons* and the *Methodist Discipline* and the *Ritual*, he was the author of *The Greek Verb* (1835), *Die Aufgabe*

der christlichen Kirche in neuenehnten Jahr-hundert (1857). *A Commentary on Matthew and Mark*, English and German (1864). *An Introduction to the Gospel Records* (1866); *The Larger Catechism*, English and German (1869); *Die kleiner Katechismus für die deutschen Gemeinden der Bischoflichen Methodisten Kirchen*, English and Swedish (1870)

NASTURTIUM. See CRESS, TROPÆOLUM.

NA/SUA. See COATI.

NATA. See NIATA.

NATAL, na-tal'. A colony of Great Britain on the southeast coast of Africa, an original province of the Union of South Africa, bounded by the Transvaal Province, Portuguese East Africa, the Indian Ocean, Cape of Good Hope Province, Basutoland, and the Orange Free State Province (Map: Cape of Good Hope, K 7) Its area, including Zululand and the portion of Transvaal annexed in 1902, is 35,290 square miles

Topography. Natal occupies a part of the seaward slope of the great South African plateau, which falls in a series of terraced escarpments running parallel with the coast around the southern end of the continent from the mouth of the Orange on the west to that of the Limpopo on the east. The ranges culminate in the Drakensberg (q v), which forms the natural boundary of the great inland plateau. The average height of the Drakensberg is 9000 feet, and its highest point in Natal, the Montagne aux Sources, has an altitude of 11,155 feet. Below the last ridge of the escarpment is a low coastal plain which widens northward, where it contains a series of large, shallow lagoons, of which the largest is Lake St Lucia, 55 miles long and 10 miles wide. Natal is watered by numerous permanent rivers of great volume, but, owing to the enormous fall of 8000 to 9000 feet in less than 300 miles, they are all violent mountain torrents falling in a series of cataracts to the sea. The largest is the Tugela.

Climate. The annual precipitation, falling under the influence of the southeast trades blowing over the warm waters of Mozambique Channel, along the coast, is about 44 inches, while in the elevated interior it is much heavier. In regard to temperature Natal presents a series of climatic zones, from the subtropical coastal region with a mean temperature of 68° to the frigid highland region. The former, however, is tempered by cool southeast storms and the latter by the hot winds from the interior.

Flora. The flora is characterized in general by richness and variety, due to the diversity of climates. In the coastal region we find the tropical euphorbias, bamboo, cotton, indigo, sugar cane, coffee, fig, and coconut, in the middle zone the common European cereals, fruits, and vegetables, while higher up are good pasture lands.

Fauna. Nearly all the large wild animals which formerly overran the country have disappeared. Snakes are still found near the coast, including the python, the puff adder, and the venomous cobra.

Minerals. Although coal is the only notable mining product, Natal is reported to be rich in mineral resources. Among the minerals known to occur are asbestos, copper, gold, iron, argentiferous lead, tin, fire clay, graphite, and gypsum. There are extensive coal measures around the head streams of the Tugela. The output of coal in 1911 and 1912 respectively was 2 679,551 tons

(valued at £725,448) and 2,765,068 tons (£771,755). The gold output in 1911 was 1706 ounces (valued at £7246) and, in 1912, 1242 ounces (£5276)

Agriculture and Stock Raising. Much of the province is well adapted for either agriculture or grazing. In 1911 there were 481,807 morgen under cultivation (one morgen = 2 11654 acres). The census of that year returned the number of workers on farms at 80,825, including 6944 male and 2352 female whites, 35,958 male and 9541 female South African natives, and 19,618 male and 6412 female persons of other colored races. The leading crop is corn, which constitutes the staple food of the natives. In the year 1910-11 the yield of corn was 1,805,745 muids (of 200 pounds). Kafir corn, 594,132, wheat, 7231, peas and beans, 44,087, and, in muids of 150 pounds, oats, 43,639, sweet potatoes, 285,905, potatoes, 202,641. On the coast and in Zululand there are large sugar and tea plantations. In 1910-11 the production of sugar cane for feed was 36,458 tons, sugar cane for sugar, 1,095,034 tons, sugar, 79,633 tons, molasses, 5,078,600 pounds, rum, 46,733 gallons, tea, 5,007,091 pounds. In 1911 there were 75,567 horses, 15,602 mules, 28,018 asses, 456,087 cattle, 1,519,258 sheep, 989,274 goats, 110,332 swine, and 4111 ostriches. Pastoral production in pounds, according to census returns, for the year ended April 30, 1911: wool, 4,811,315, mohair, 186,178, ostrich feathers, 2573, butter, 1,548,593, cream, 1,068,456, cheese, 15,746, honey, 2149.

Commerce and Communications. A large foreign trade passes through the port of Durban, including transit trade with the Orange Free State and the Transvaal. The chief exports include wool, sugar, hides and skins, tea, coal, corn, and wattle bark. The leading imports are machinery and other iron and steel goods, cotton, and apparel. Since the establishment of the Union separate trade returns have not been made for the provinces, but, as most of the foreign trade passes through Durban, the figures for that port are of interest. Total imports at Durban in 1910 and 1912 respectively, £11,493,136 and £12,021,140, total exports, £4,327,784 and £5,123,478. Of the imports of merchandise to the Union of South Africa in 1912, 30.8 per cent is credited to Durban, and of the exports of merchandise 7.9 per cent. In respect of imports Durban is the first port of South Africa, while in respect of exports Cape Town is far in the lead (76.6 per cent in 1912).

At the end of 1912 there were 5800 miles of main roads. The province has rail communication with the Transvaal and with the Orange Free State and thence with the Cape Province. A Natal line crosses the Cape border into Griqualand East, but does not connect with the Cape system. The railways are of 3 feet, 6 inches gauge. Upon the establishment of the Union the state railways were merged into one system, the South African Railways, under the control of the Union government. The total open mileage of this system at the end of 1912 was 7848, of which 1053 miles, or 13.14 per cent, were in Natal. In addition Natal had 50 miles of private railway. Railway building in Natal began in 1878, when 27 miles were constructed. The mileage increased to 307 in 1890, 570 in 1900, 999 in 1910, and 1053 in 1912. What is known as the Natal Division of the South African Railways comprised 1111 miles

at the end of 1912. The capital cost of this division was £15,283,929 (per open mile, £13,757); earnings in 1912, £2,617,297, working expenses, £1,661,230, excess of earnings, £956,067, interest on capital, £513,988, profit after payment of interest, £442,079. At the end of 1912 the Durban municipal tramways had a length of 19.82 miles and the Pietermaritzburg municipal tramways 8.25 miles. In 1912 there were 249 telegraph offices in Natal, with 2165 miles of line and 6314 miles of wire, telephone wire, 6638 miles.

Government. Natal was annexed to Cape Colony in 1844, but in the following year was placed under separate government. In 1856 it was erected into a separate colony, with partially representative government, and in 1893 responsible government was introduced. Zululand was annexed at the end of 1897, and at the beginning of 1903 the districts of Utrecht Vryheid, Paulpietersburgh, and Ngotshe, formerly belonging to the Transvaal, were annexed. On May 31, 1910, the colony became an original province of the Union of South Africa. The legislative power of the province is vested in the representative Provincial Council (25 members), elected for three years. Its action is subject to the veto of the Governor-General in Council. Executive authority rests with an executive committee, consisting of an administrator, appointed for five years by the Governor-General in Council, and four members elected by the Provincial Council. Of the 130 members of the House of Assembly at Cape Town, 17 represent Natal. Provincial revenue consists of a subsidy voted by the South African Parliament and certain revenues transferred or assigned by the Union government. The seat of the provincial government is Pietermaritzburg.

Education. The 1911 census returned the following degrees of education—persons able to read and write whites, 43,178 males and 36,877 females, other than whites, 24,203 males and 19,627 females, read only whites, 518 males and 531 females, other than whites, 4140 males and 3862 females, neither read nor write whites, 8723 males and 8131 females, other than whites, 483,158 males and 559,950 females. The provincial government controls educational institutions, except those for higher education, which are under the control of the Union government. In 1912 the aggregate number of white pupils in attendance at the government and inspected schools was 16,297, the average daily attendance being 86 per cent. Average daily attendance at government high and preparatory schools was 720. About 1500 pupils attended private unaided schools. White children receiving free education in 1912 numbered 2956. Probably only a small proportion of white children receive no instruction. In 1912 government-aided schools for natives numbered 231, with an enrollment of 17,852; and for Indian children 34, with an enrollment of 3532.

Population. The population at different dates is shown in the table below, the 1901 figures and those for natives in 1891 are estimates.

The figures in the table for 1891 do not include Zululand, and those for 1901 do not include the districts annexed from the Transvaal in 1903. The total for 1904 includes 3774 British troops and their dependents. The natives are classified as Bantus, except 6686 mixed and other colored in 1904 and 9092 in 1911. The Asiatics are almost wholly Indians. The 1911 census (May

7) showed an urban population of 152,988 and a rural population of 1,041,055. Conjugal condition of the white population in 1911: never married, 33,912 males and 26,159 females; mar-

	1891	1901	1904	1911
Whites	46,788	63,821	97,109	98,114
Asiatics	41,142	74,385	100,918	133,439
Natives	455,983	786,912	910,727	962,490
Total	543,913	925,118	1,108,754	1,194,043

ried, 17,350 and 16,870, widowed, 1129 and 2508, divorced, 78 and 53, unspecified, 26 and 29. In 1911, of the white inhabitants, Christians numbered 94,432, non-Christians 1492; of the natives (Bantus) 140,965 were Christian and 812,415 had no religion, of the mixed and other colored inhabitants, 10,721 were Christian, 121,989 were non-Christian, and 6599 had no religion. In 1911 Durban with suburbs had 89,998 inhabitants (20,007 white), Pietermaritzburg, 30,555 (14,737), Ladysmith, 5595 (2287).

History. The coast of Natal was first sighted on Christmas Day, 1497, by Vasco da Gama, who named the country in honor of the day (Nativity). The first attempt at settlement made by the Dutch about 1720 proved unsuccessful. In 1824 Captain Farewell and his 20 companions concluded a treaty with Chaka, King of the Amazulus, who had overrun the region during the first decade of the century, but in 1828 the English colony was broken up by Dingaan, the successor of Chaka. In 1835 Captain Gardiner obtained a concession of land from Dingaan and established himself with a number of missionaries at Durban. Two years later the Dutch of Cape Colony, who, in disgust with British rule, had set out in 1835 on their great trek northward, entered the confines of Natal. The first band of pioneers, numbering 79 men under Pieter Maurits Retief, were treacherously murdered by Dingaan, but the tide of Boer immigration continued unchecked, the Zulu power was broken in a great battle on the Blood River, Dec. 16, 1838, and in 1839 the Republic of Natal was organized, comprising the districts of Pietermaritzburg, Weenen, and Durban. Great Britain, however, continued to regard the Afrikanders as her subjects, and annexed the Republic to Cape Colony in 1843. The greater part of the Boer population trekked westward and northward to found the Orange Free State and the Transvaal. In 1856 Natal was made an independent colony. In 1879 war was carried on against Cetewayo, King of the Zulus, his territory was overrun and occupied, and in 1897 Zululand was annexed to Natal. In 1881 the Transvaal Boers entered the extreme northwestern corner of the colony and defeated the British at Majuba Hill (qv). In 1899 and 1900 northern Natal was the scene of fierce fighting between the British and the Boers. At Elands-laagte, Glencoe, and Ladysmith, and all along the line of the Tugela, the most obstinate and sanguinary battles of the war occurred. In 1906 there was a formidable Zulu uprising in the Tugela region. It was suppressed with heavy loss to the natives. In 1909 after a referendum Natal determined to join the Transvaal. In 1910, upon the founding of the Union of South Africa, Natal became one of the original provinces.

NATAL. The capital and chief port of the State of Rio Grande do Norte, Brazil, situated on the right bank of the Potengy River, near the Atlantic, 140 miles north of Pernambuco (Map: Brazil, K 5). The estuary which forms the harbor is obstructed by sand bars, but extensive dredging has opened the port to vessels drawing 22 feet. The port is the chief outlet for the products of the state, and it exports cotton, leather, rubber, woods, and sugar. It is the seat of a United States consular agent. Pop. (est.), 20,000

NATAL GRASS (*Tricholana rosca*). A South African perennial grass of rapid growth, attaining a height of 1 to 3 feet, according to soil and moisture conditions. It has been extensively introduced into many of the warmer portions of the globe, and in most places it is highly appreciated as a hay and pasture grass. It is probably best adapted to use as a hay grass as it cures readily and three to five cuttings per season are reported. In India it thrives best at medium to high elevations. In Australia immense yields are reported when grown in river bottoms. In Hawaii it has some value as a pasture grass at medium elevations, but it is considered better as hay. In Florida three cuttings per season have been secured, and it is considered a valuable addition to the forage crops in that State. As hay it is little inferior to timothy, as shown by analysis. Another species, *Tricholana teneriffa*, is called red Natal grass in Australia.

NATALIE, na'tá'lé' (1859-). A queen of Servia, the daughter of a Russian officer named Keshko. In 1875 she married Prince Milan, afterward King of Servia, but then married life was unhappy, and in 1888 Milan procured a divorce. After King Milan's abdication in 1889 she returned to Belgrade and remained for some time with her son, King Alexander, but the National Assembly having requested her to leave the country in the interest of internal harmony, she withdrew in 1891, though with the masses of the people she enjoyed immense popularity, owing partly to her beauty. In 1893 she became reconciled to King Milan. In the following year she was restored by royal decree to all her rights as a member of the royal family, and in 1895 she returned to Belgrade and was received with great enthusiasm. But she made Biarritz, France, her residence, and indeed, after the assassination of Alexander in 1903, she was forbidden to enter Servia. In 1902 she joined the Roman Catholic church.

NATAL SORE. See BOB.

NATANT. A term in heraldry. See NATANT.

NATCHEZ, năch'ez (from their native name, *Na'chi*). An interesting tribe, of Muskogean stock, originally residing in nine villages in the vicinity of the present city of Natchez, Miss., with a total population of perhaps 2500. Although comparatively a small tribe, they exercised a commanding influence from the Gulf to the Ohio. Their greatest religious rites were connected with the worship of the sun. They were sedentary and agricultural, expert basket weavers and skillful potters, while their men bore a deserved reputation as proud and determined warriors. In 1716 they quarreled with the French, who had without their consent erected Fort Rosalie in their country. In 1722 a fight occurred at the post, in which several were killed on both sides. Other collisions followed, until the Natchez secretly organized a combination of several neighboring tribes to drive out the white intruders. On Nov. 28, 1729, the Natchez fell upon the garrison and massacred 200 men, only 20 escaping, besides making prisoners of all the women, children, and negro slaves. The war rapidly spread to the outlying settlements, but after a few weeks the Natchez, unable to oppose the French and their Indian allies, fled across the Mississippi and fortified themselves in stockade forts on Black River, La. Here they were attacked in January, 1731, by a strong French force, which succeeded in taking nearly 450 prisoners, the rest escaping during a storm at night. All the prisoners were sold as slaves in the West Indies. The remnant, made desperate by defeat, continued the war, but were obliged to give way before fresh Spanish reinforcements from the west. This ended the war, in which they had probably lost half their tribal population. The survivors took refuge with other tribes, some with the Chickasaw, others with the Creek and Cherokee. A part of them, under the name of Notchee, even found their way to South Carolina and were incorporated with the Catawba. Consult J. R. Swanton, *Indian Tribes of the Lower Mississippi Valley and Adjacent Coast of the Gulf of Mexico* (Washington, 1911).

NATCHEZ. A city and the county seat of Adams Co., Miss., 98 miles southwest of Jackson, on the Mississippi River and on the Yazoo and Mississippi Valley, the Mississippi Central, the Natchez and Southern, and the St. Louis, Iron Mountain, and Southern railroads (Map: Mississippi, C 7). It is built largely on a bluff, 200 feet above the river, the summit of which contains the most costly residences, and the base, or water front, is devoted to shipping. Among noteworthy features of the city are the fine Memorial Park, Fisk Library, Agnes Z. Carpenter Public Library, Jefferson Military College, Natchez Institute, Institute Hall, Elks and Prentiss Club buildings, Natchez Hotel, and the handsome courthouse and ante-bellum city hall buildings. A national cemetery on a bluff adjoining the city contains 3159 graves, 2780 of unknown dead. In it is an observatory commanding fine views. Natchez has steamboat connection with the whole Mississippi valley and is the shipping port of a large cotton region, exporting annually many thousand bales. There are cotton mills, a cotton compress, cottonseed-oil mills, a foundry, saw and planing mills, an artificial ice plant, etc. The government is administered under a charter of 1877, which provides for a mayor, chosen biennially, and a unicameral council that elects the school trust-

tees. The water works are owned by the city. Pop., 1900, 12,210, 1910, 11,791.

In 1716 Bienville built Fort Rosalie on Natchez Bluff. In October, 1729, the place was destroyed, and most of its inhabitants were massacred by the Natchez Indians. In 1763, according to the terms of the Treaty of Paris, the English took possession and renamed the fort Fort Parmure. From this year dates the real foundation of the village. A Spanish force from New Orleans dispossessed the English in 1779, and in 1798 Spain gave way to the United States. Natchez was incorporated as a city in 1803. It was the capital of the Natchez District and Mississippi Territory to 1802. It suffered considerable damage from a tornado in 1840. The city was shelled by Commodore Porter in 1862, and in 1863, soon after the fall of Vicksburg, it was occupied by Federal troops and remained under their control until the close of the war.

NATCHEZ, na'ché', LES. A romance written by Chateaubriand during his exile in England and printed in 1825-26.

NATCHEZ TRACE. A famous highway which traversed the present State of Mississippi. It was made possible by treaties entered into in 1801 between the United States on the one hand and the Chickasaws and Choctaws on the other. The road from the national boundary to Natchez was laid out in 1802. Appropriations were made by successive Congresses for the road. The Natchez Trace, after crossing the Tennessee River a few miles below the Mussel Shoals, at Colbert's Ferry, pursued a southwesterly course through the country of the Chickasaws and Choctaws to the Grindstone Ford on the Bayou Pierre, thence ran south and west to Natchez. South of Natchez it followed the general trend of the river to the line of demarcation and eventually connected with the various roads leading to New Orleans. At Nashville, Tenn., this old road connected with the public highway which ran east to Pittsburgh, Pa. The total distance from Natchez to Nashville was 501 miles, and the distance to Pittsburgh was 1013 miles. Numerous stations sprang up along the road between Natchez and Nashville. Under the auspices of the Daughters of the American Revolution granite boulders have been erected marking the site of this famous old highway.

NATCHITOCHES, năk'i-tôsh'. An extinct tribe of the Caddoan linguistic family of Indians, living formerly on the Red River in Louisiana. Their habit of life was partly hunting, partly agricultural. They dwelt in permanent houses covered with sod. Their religion demanded under certain conditions the sacrifice of human beings. See CADDOAN STOCK.

NATCHITOCHES, năk'i-tôsh' or năk'i-tôsh'. A town and the parish seat of Natchitoches Parish, La., 72 miles by rail southeast of Shreveport, on the Cane River and on the Texas and Pacific and the Louisiana and Northwestern railroads (Map: Louisiana, C 3). It is the see of a Roman Catholic bishop and has a State normal school, a high school, and St Mary's Academy (Roman Catholic). The town is surrounded by a productive district devoted to stock raising and agriculture, its chief products being cotton and sugar cane. Natchitoches owes its origin to a trading post, established in 1714 by the French, and is the oldest town in the State. The water works and electric-light plant are owned by the municipality. The commission

form of government has been adopted. Pop., 1910, 2532.

NATHAN, MAUD (1862-). An American economist, born in New York City, a sister of Annie Nathan Meyer (q.v.) and the wife of Frederick Nathan, to whom she was married in 1880. She made addresses before the International Congresses of Women at London in 1899 and Berlin in 1904, the International Peace Congress at New York in 1907, and the International Conference of Consumers' Leagues at Geneva in 1908. In 1897 she became president of the Consumers' League of New York. She served also as vice president of the National Consumers' League, of the Equal Suffrage League of New York, and of the Equal Franchise League. Mrs Nathan became known as a magazine writer and as a public speaker, and in 1912 she campaigned for the Progressive party.

NATHAN'AEI (Gk *Nathanaël*, transliteration of Heb *Nethan'el*, God gives). One of Jesus' first disciples. He was of Cana of Galilee and, therefore, a neighbor of Philip, who was of Bethsaida. Both may have been disciples of the Baptist. He is mentioned in two passages in the Fourth Gospel (1. 45-51, xxi 2). In the former passage, after Jesus had called Philip to his following, Philip finds Nathanael and announces that in Jesus of Nazareth had been discovered the one "of whom Moses in the law, and the prophets wrote"—in other words, the Messiah. Nathanael questions so great a religious product from so insignificant and possibly ill reputed a place ("Can any good thing come out of Nazareth?"), but is willing to accept Philip's invitation to make the test of personal acquaintance. Because of this open-mindedness he is greeted by Jesus as "an Israelite indeed in whom is no guile." His question at Jesus' estimate of his character ("Whence knowest thou me?") is not lacking in modesty, it is merely a naive surprise at Jesus' knowledge of character in advance of knowledge of person and, upon Jesus' reply ("Before Philip called thee, when thou wast under the fig tree, I saw thee"), brings him at once to an acknowledgment of Jesus' Messiahship ("Rabbi, thou art the Son of God: thou art the King of Israel"). In the latter passage he is one of the group of seven to whom Jesus appeared at the Sea of Galilee after the resurrection. For the possible identification of Nathanael with the Bartholomew of the Apostle list, see BARTHOLOMEW.

NATHAN DER WEISE, nă'tăn dêr ví'ze. A dramatic poem by Lessing, published in 1779, in which the author clothed in poetic form the principles underlying his controversial writings. The drama is based upon the story of *Melchisedec the Jew*, in Boccaccio's *Decamerone*. The character of Nathan is a monument to Lessing's friend Moses Mendelssohn, the Jewish philosopher.

NATHORST, nă't'hôrst, ALFRED GABRIEL (1850-). A Swedish scientist, distinguished for his Arctic researches and expeditions. In 1870 and 1882 he served in scientific expeditions to Spitzbergen. In 1883 he was one of the scientific staff of Baron Nordenskiöld's (q.v.) expedition to Greenland. Leading an expedition in 1898, Nathorst circumnavigated Spitzbergen and visited and explored both the Wyches Islands (King Charles Islands) and Gillis Land (q.v.). He led in 1899 a geological expedition to east Greenland, where he discov-

ered King Oscar Fiord. In 1884 he became director of a section of the Riks-Museum, Stockholm. He was highly honored not only by the scientific societies of Sweden, but also by the universities of Cambridge and Greifswald and by societies of Berlin, Belgium, Vienna, etc. A voluminous and standard writer on Polar subjects in their relation to geology, geography, zoölogy, and especially to paleobotany, Nathorst published altogether more than 300 papers, essays, and books. A memoir on fossil floras of the Arctic region was issued by the Smithsonian Institution. His most important geographical work is *Tred samrär i Norra Ishafvet* (2 vols., 1901). *Zur fossilen Flora der Polarländer* (2 vols., 1894-1915) is also especially significant in its field. For scattered memoirs, consult Hulth, *Swedish Arctic and Antarctic Explorations* (Upsala, 1910).

NATHUBHOY, nāt'q-hoi, SIR MANGALDAS (1832-90). An East Indian merchant and reformer. He studied English, succeeded to his grandfather's fortune in 1843, and became the head of the Kapor Bama caste. In 1866-74 he was a member of the Legislative Council of India. Interested in social and educational reform, he established a dispensary at Kalyan in memory of his wife and a female ward in the David Sassoon Hospital at Poona and founded eight traveling fellowships in Bombay University. His benefactions amounted to nearly \$2,500,000. He was knighted in 1875.

NATICA (Neo-Lat., from Lat. *natus*, buttock). A genus of gastropod mollusks, represented by *Natica heros* (now *Polynices heros*), one of the most common and largest of the univalves and to be found in abundance along the Atlantic coast from New Jersey to Maine. The shell is large, composed of several whorls, with a small flattened spire or apex. The aperture is large, lunate in shape, and can be closed by a large horny door or operculum.

WHITE SNAIL (*Natica heros*)

a, the shell, b, an egg case, c, animal, with distended foot, in the attitude of walking.

The animal lives partly buried in the sand, near low-water mark. On taking it up the large, round, swollen foot or creeping disk ejects a spray of water as if poured from the rose of a watering pot. The animal has two short, broad, flattened tentacles, but, owing to its burrowing habits, its eyes are wanting. Its eggs are laid in a large, thin circular mass, like a miniature lamp shade, which is a curious object and a good deal of a puzzle to young

collectors. Another common but much smaller snail (*Polynices triseriata*) is thought to be the young of this species. It is marked with three rows of bluish or chestnut-brown spots. A rather more southern species is *Polynices duplicata*, in which the umbilicus (open in the other species) is closed or nearly so. See GASTROPODA. Consult A. F. Arnold, *The Sea Beach at Ebb-Tide* (New York, 1901), and A. G. Mayer, *Sea-Shore Life* (ib., 1905).

NATICK, nāt'ik. A town, including several villages, in Middlesex Co., Mass., 17 miles west-southwest of Boston, on the Charles River and on the Boston and Albany Railroad (Map Massachusetts, E 3). It has public parks, one containing a soldiers' monument, another a bathing beach, and still another a monument to the memory of John Eliot, the head of Cochituate Lake, one of the sources of Boston's water supply, the Walnut Hill School, for young ladies, the Morse Institute (public library and reading room), the Morse Hospital, and the Bacon Public Library. Another place of interest is the shoe shop where Henry Wilson, afterward Vice President, worked as a cobbler. The principal industries are the manufacture of boots, shoes, shirts, clothing, baseballs, boxes, saws, etc. The government is administered by town meetings. There are municipal water works. Pop., 1900, 9488, 1910, 9866, 1914 (U. S. est.), 10,026. Natick was founded by John Eliot, who about 1651 brought hither from Nonantum a company of "praying Indians," and for many years it was almost exclusively a settlement of Indian converts. Near the centre of the town is their old burial place. Natick was incorporated in 1781. Consult O. N. Bacon, *History of Natick* (Boston, 1856), S. A. Drake (ed.), *History of Middlesex County*, vol. ii (ib., 1880), Hurd, *History of Middlesex County, Mass.* (Philadelphia, 1890), W. W. Tooker, "Significance of John Eliot's Natick," in *American Anthropologist*, vol. x (Washington, 1897).

NATIONAL ACADEMY OF DESIGN, THE. A society of American painters and sculptors, with headquarters in New York City. The first Academy of Arts in New York was founded in 1802 by prominent citizens, among whom was only one professional artist, Trumbull, but it excited little interest until 1825, when a secession of the younger artists occurred. Dissatisfied with the character of the old society, they formed a new association, called the New York Drawing Association, directed by practical artists. The present name was adopted in 1828, and the society, composed of 30 members, was incorporated. Prof. S. F. B. Morse (qv.) was the chief organizer of the movement and was twice president of the National Academy, in 1827-45 and again in 1861-62. Other presidents who did much to shape the Academy's policies were Daniel Huntington (1862-70), Frederick Dielman (1899-1909), John W. Alexander (1909-15), J. Alden Weir was elected president in 1915, Mr. Alexander having declined to accept renomination. The election was considered an indication that the more liberal and younger element in the Academy were in the ascendant. The home of the society, the Fine Arts building on Fifty-seventh Street, proved inadequate for representative exhibitions, but the city refused to grant space in Central Park for a new structure, and no other plan had been settled on up to 1915.

The society is governed by a council consisting of its officers and six members, and the instructors in the school of design are chosen from among its ranks. The Academy stood for the conservative, traditional element in art, as opposed to the more modern tendencies which were represented in the earlier work of the Society of American Artists (q.v.), but since the union of the two institutions (see below) it has sought to include in its membership all art tendencies except what it deemed the ultra-radical. It held its eighty-first annual exhibition in 1906. At these exhibitions the Clarke prize of \$300 and the Hallgarten prizes of \$300, \$200, and \$100 respectively are distributed, and the Inness gold medal for the best landscape. On July 1, 1906, the National Academy was affiliated with Columbia University and the Metropolitan Museum of Art. In 1906 the Society of American Artists was merged into the Academy, all of its members not already Academicians becoming associates. The number of Academicians, hitherto limited to 100, was increased to 125 painters, 25 sculptors, and 25 architects and engravers. The school of design connected with the Academy has been in existence since 1825, and the instruction includes classes in the antique, life, still life, anatomy, painting, perspective, composition, etching, and medal and coin engraving. These classes are open from October until May and are free to students admitted on the evidence of the school committee. The average attendance of pupils is from 200 to 300. Consult T. S. Cummings, *Historic Annals of the National Academy of Design* (Philadelphia, 1865), and also *Catalogues of the Annual Exhibitions* (New York, 1826 et seq.).

NATIONAL ACADEMY OF SCIENCES.

A society incorporated in 1863 for the purpose of examining and investigating any subject of science or art and for making the reports of special investigations at the call of the United States government, which makes appropriations for the expenses of special examinations and reports. The Academy consists of honorary members and foreign associates. Members must be citizens of the United States. One special meeting is held in each year in Washington, beginning with the third Monday in April, and another, called the autumn meeting, may be held at such time and place as the council of the Academy may determine. Special scientific meetings may be held at times and places designated by the council. In 1914 there was inaugurated a series of lectures called the William Ellery Hale lectures. These were established through a foundation offered by the children of William Ellery Hale, which provides for a course of two or three lectures at each semi-annual meeting of the Academy, to be delivered by some scientist of distinction. In the same year was also made the initial award of the Medal for Eminence in the Application of Science to the Public Welfare, this was established through a fund provided by Mrs. Helen Hartley Jenkins in memory of her father, Marcellus Hartley. The medal was awarded to Gen. George Goethals and to W. C. Gorgas for distinguished service in engineering and sanitation respectively in building the Panama Canal. The Academy has conducted or taken part in many important investigations. In 1914, at the request of President Wilson, a member was appointed to serve as one of a special commission to visit the Pribilof Islands for the purpose of

advising the government regarding the condition of the fur-seal herd and to make the recommendations concerning the policy which should be adopted with reference thereto. The committee has several funds from which appropriations are made to carry on researches in science. The standing committees of the Academy are: mathematics, astronomy, physics and engineering, chemistry, geology and paleontology, botany, zoology and animal morphology, physiology and pathology, anthropology and psychology; weights, measures, and coinage; solar research, publication; finance; and the committee on collection of historical portraits, manuscripts, instruments, and so forth. In addition to the medal awarded above, the Academy presents also every five years the Barnard Medal for Meritorious Service to Science. The Academy has about 140 members and about 45 foreign associates. The president in 1915 was William H. Welch. The *Proceedings* of the meetings are published annually.

NATIONAL ARMS. Heraldic devices typifying national sovereignty whose use has received official sanction. National arms originally were in large part derived from the personal emblems of the ruler and thus gradually came to represent governmental authority, though with changes in forms of government and especially with the rise of democracy these emblems often lost their original significance. In some cases where monarchical government has been supplanted by a republican form there has been a corresponding change in the national arms, as instanced in the case of Portugal in 1910, while in such a democracy as the United States national arms have been sanctioned and adopted without the slightest reference to any emblem of an individual or group of individuals. Likewise in Great Britain, where the arms have resulted from the heraldic devices of individual sovereigns, to-day they are symbolic of governmental rather than personal authority. While the insignia of saints and martyrs usually appear in the heraldic blazons of nations according to the laws of heraldry, which as is well known dates from the Crusades, yet among the national emblems and symbols there are often found forms of crosses and stars, swastikas, and other devices plainly of prehistoric origin. The reader is referred to the article **HERALDRY**, especially the section where is discussed the application of its laws and principles to national coats of arms.

NORTH AMERICA

United States. The national emblem consists of arms and crest, the arms being an American eagle displayed proper, bearing on his breast a shield having 13 pales, alternately silver (white) and red. There are seven white pales, thus making a white one come in the centre and making the edges white, the reverse of the order on the national ensign. (See **FLAG**.) The shield has a chief of blue, i.e., an upper horizontal portion, but on this chief there are no stars. The sinister talon of the eagle holds 13 arrows, proper, the dexter claw grasps an olive branch, proper. The olive branch has 13 leaves and 13 berries, though this number is not specifically prescribed by law. The motto on a ribbon held in the eagle's beak is *E pluribus unum*, meaning "One out of many," and has reference to the formation of one nation by the union of the States.

The crest is over the eagle's head and is a circular golden glory breaking through, and so surrounded by, a white cloud. On the glory are 13 five-pointed stars, described in heraldic language as mullets. These are on a blue ground. The stars are silver (white) and represented a new constellation in the political firmament. On the reverse of the 50-cent coin, where the arms are shown approximately correct, the 13 stars over the eagle's head are without the glory, and the olive branch has no berries.

EUROPE

Austria-Hungary. The arms of the dual monarchy are a black double-headed eagle. The heads are crowned, and the double head indicates the former Holy Roman Empire. Above and between the eagle's heads is the Imperial crown of Austria. The dexter claw of the eagle holds a sword and sceptre and the sinister claw an orb, and on the breast is shown a shield divided equally into three vertical portions—(1) Hapsburg, a golden ground with a rampant lion in red, (2) Austria, a silver fess on a red ground, (3) Loraine, a red bend bearing three eaglets in silver, all on a golden ground. The shield is surrounded by the collars of the Order of the Golden Fleece and of Maria Theresa. On the wings of the eagle are the arms of the 11 provinces, each small shield ensigned with a crown. The provinces represented are, on the dexter wing: (1) Hungary ancient impaling Hungary modern. This is four silver bars on a red ground, said to refer to the four great rivers of Austria, the Danube, the Save, the Drave, and the Theiss. On a red field a triple mount green, with a patriarchal cross silver issuing from a crown gold, for Austria modern. The mountains are supposed to represent the three highest peaks in the Carpathians. (2) Esclavonia, (3) Austria above the Enns impaling Austria below the Enns, (4) Salzburg, (5) Styria; (6) Tirol. At the top of the sinister wing is (7) Bohemia, (8) Illyria, (9) Esclavonia, (10) Moravia impaling Silesia, (11) Carinthia impaling Carniola.

Belgium. The royal arms of Belgium are a golden lion on a black ground, its tongue and claws are red. The shield is ensigned with the royal crown of Belgium, and the supporters are two golden lions. The motto of Belgium is *L'Union fait la force* (Union makes strength). This coat of arms is borne on the central yellow portion of the royal standard, a flag composed of equal vertical stripes of black, yellow, and red.

Bulgaria. A crowned golden lion, salient, bearing a shield with a blue diapered bend dexter on a ground of five bars black on gold.

Denmark. The arms of Denmark are quartered by the Dannebrog. (See NATIONAL FLAGS.) The first quarter represents Denmark and is three blue lions crowned on a golden ground, powdered with red hearts. The second quarter is for Schleswig, two blue lions on a golden ground. The third quarter shows modern Sweden, three open golden crowns on a blue ground, Iceland, a silver hawk on a red ground, the Faro Islands, a silver goat, walking, on a blue ground. Greenland, a rampant silver polar bear on a blue ground. The fourth quarter shows Jutland, a blue lion at the top, on a golden ground, and ten red hearts below;

Vandalia, a golden dragon on a red ground. On a secondary shield or inner escutcheon appear the arms of (1) Holstein; (2) Stomerik; (3) Dietarchen or Ditzmers; (4) Lauenburg. On a third shield, hanging in front, or on the centre of the others, Oldenburg impales Delmenhurst. The supporters are two savage men wearing green wreaths and each holding a wooden club. The royal standard is red, with a white cross. The flag is swallow-tailed, and at the space where the cross's arms intersect there is a square of white containing the royal arms.

France. The arms of Republican France are neither official nor an heraldic device. The official seal adopted in 1870 represents a seated figure of France bearing the fasces. It is a more or less conventional representation of the goddess of liberty, with a sheaf of grain, typifying fruitfulness, at her feet, the lamp of truth or reason, and other symbols. The head is decorated by rays. The tricolor or national flag is used exclusively for patriotic display, though a decorative emblem with letters RF was authorized in 1896, while a shield with the national colors and bearing the letters RF and the axe and fasces is frequently employed.

Germany. The Imperial arms of Germany consist of a black eagle displayed, with red claws and beak, bearing upon his breast the arms of Prussia, a golden shield with a black, displayed eagle holding in his dexter talon a sceptre and in his sinister one an orb. On the breast of the Prussian eagle is a small shield quartered black and white, the colors of the Hohenzollerns.

Great Britain. The arms of Great Britain are the personal arms of the King. William the Conqueror bore two golden lions, or leopards, on red, said to represent Normandy and Maine, and when Henry II married Eleanor of Aquitaine he added a lion to represent his sovereignty over that province. These now appear in the first quarter. The lion rampant of Scotland, red on a golden ground, is surrounded by the double tressure, flory counterflory, also red, and appear in the second quarter. The origin of the tressure is uncertain, it probably refers to an *entente* with France. It is shown on the seal of Alexander III (1249). The Irish harp, gold with silver strings on a blue ground, appeared in the royal arms (third quarter) in the reign of James I (1603). Blue is the color for Ireland, not green, as is so often incorrectly used on bunting. The fourth quarter repeats the first, according to heraldic rules. The shield is surrounded by the garter of the Knights of the Garter, and it is quite proper to show the collar of the order as well. The supporters are, dexter, a crowned lion rampant gold for England and, sinister, a silver unicorn rampant with gold collar and chain for Scotland. The motto is *Dieu et mon droit* (God and my right), with the rose, shamrock, and thistle placed about the ribbon. The crest is a crowned lion standing on the crown, upon a helmet placed afronté, with five bars across the face. The royal standard, which is the King's personal flag, hoisted on shipboard or on a building only when the King himself is present, displays merely the arms without crest, supporters, or mottoes and is practically the royal escutcheon in bunting. The arms of the Prince of Wales are the same as the King's, except that they are differenced by a silver label of three points and contain the

crowned arms of the Principality of Wales displayed on a shield of pretense in the centre. The supporters are also differentiated by a label.

Greece. A blue shield bearing a silver cross and surmounted by the crown is the arms of Greece. The supporters are two savage men with clubs, standing above the motto. See NATIONAL FLAGS.

Holland. Upon a blue ground dotted with golden billets there is a crowned golden lion rampant, grasping in one paw a naked sword and in the other a sheaf of arrows. The shield is crowned, and the supporters are two crowned lions rampant. The motto on a scroll underneath is *ic maintiendrai* (I will maintain).

Italy. The royal arms of Italy are a crowned black eagle displayed on blue. On the breast is a cartouche, or oval shield, with a white or silver cross on a red ground. The shield is surrounded by the collar of the Annunciation, with its pendant representing that event. The collar is composed of a series of red and white roses and the letters RTFE joined together. In the collar the letters are thus arranged. The meaning is uncertain, but, as they appear in the collar, the reference is probably to the sentence, *Rhodus tenuit fortitudo ejus* (His firmness held Rhodes), referring to the assistance given by Amadeus the Great to the Knights of St John of Jerusalem in 1310 at the siege of Rhodes by the Saracens. See NATIONAL FLAGS.

Monaco. This small principality has a canopy "of the colors," i.e., like the shield. This is heraldically described as fusily silver and red. The canopy is crowned and is also covered with diamond-shaped figures, white and red, as described. The supporters are two monks with swords. The collar of the Order of St Charles surrounds the shield. The motto placed over the shield is *Deo jurante* (God helping).

Montenegro. Red, a double-headed eagle, displayed silver, over which is the royal crown. The bird holds sceptre and orb, a small shield on the breast contains the letters H I, and underneath the eagle is a golden lion. The initial, though like an "H," is really Montenegrin "N"—referring to Nicholas, the King—"I" is the Roman numeral.

Norway. A red, crowned shield, in which is a golden lion rampant holding a battle-axe.

Portugal. The arms of Portugal consist of an annular sphere upon which is placed a silver shield bearing five small escutcheons of blue with five plates or disks of silver in each. The large shield has a red border on which are seven golden castles. See NATIONAL FLAGS.

Rumania. Within a canopy of ermine is a crowned quartered shield: (1) a golden eagle displayed on blue, (2) a lion's head, gold on red, (3) a golden demihon issuing from an antique crown, on red, (4) two dolphins, gold on blue. A small shield of pretense is quartered white and black.

Russia. The Imperial arms of Russia are the black double-headed eagle. On the breast of the eagle is a red shield showing in natural colors St George slaying the dragon. Surrounding the shield are the collar and pendant of St. Andrew. The heads of the eagle are crowned, and above and between them is the crown of Russia. The talons hold orb and sceptre. The Imperial eagle on the standard has no sceptre and orb, these being replaced by two maps, one of the Caspian Sea in the dexter claw and the Black Sea in the sinister. The

beaks hold two maps, the dexter beak showing the Baltic Sea and the sinister the White Sea. On the displayed wings of the eagle are eight small shields representing the provinces of Russia. They are not crowned, but stand for—(1) Kazan, a black dragon, (2) Poland, a silver eagle, displayed, (3) Taurida, an eagle, displayed, with a shield on its breast bearing a triple cross; (4) this escutcheon is divided into three and looks like a division of a window with two curtains drawn aside at the bottom and the blind or shade showing in the exposed space between (a) Kiev, the figure of St. Michael, (b) Novgorod, a throne in front of which are two black bears on a golden ground and two fish in base, (c) Vladimir, a red lion rampant with golden crown, at the top of the sinister wing are (5) Astrakhan, a royal crown and scimitar, (6) Siberia, two martins on an ermine ground, (7) this shield is quartered: (a) Kabarda, arrows and stars, (b) Iberia, a leaping horse, (c) Kartalinia, a volcano, (d) Armenia, a red lion rampant, (e) Circassia is shown by the curtain-and-window arrangement—a warrior, and (f) Georgia—St George and the dragon is placed on a shield of pretense; (8) is Finland, a lion rampant with sword and scabbard.

Servia. A crowned red shield within a crowned ermine canopy. On the shield is a silver eagle displayed bearing upon its breast a red shield with silver cross and the date 1804. Between each two of the arms of the cross is a Slav initial letter. The supporters are two natives holding flags of the colors, and the motto is *Spes mihi prima Deus* (My hope is God, first of all). The motto is not now used.

Spain. The arms of Spain are within an ermine-crowned canopy. They consist of a quartered shield representing 1 and 4, Castile, and 2 and 3 León, a golden castle on a red ground for Castile and a red lion rampant on a silver field for León. The shield is encircled by the collar of the Golden Fleece. In the lower portion, between the vertical division, or *enté en point*, there is on silver a pomegranate proper, for Granada. Over all a cartouche of France (modern), three golden fleurs-de-lis on a blue field.

Sweden. An ermine canopy on which appears a crowned shield of blue quartered by the gold Dannebrog. The quarters are 1 and 4, three open golden crowns for Sweden; 2 and 3, a golden lion rampant on three silver bends, wavy, sinister, for Gothland. On a small shield, at the centre of the Dannebrog, is Vasa impaling Pontecorvo. Vasa is tierced in bend, blue, silver, and red, a gold sheaf or vase. Pontecorvo has a blue shield, and in chief an eagle of the French Empire, gold. In base a three-arched, towered bridge over a river, silver. The whole is surrounded by the collar of the Order of the Seraphim. The supporters are rampant lions with double tails.

Switzerland. Switzerland bears a red shield with a white cross in the centre. The arms of the cross do not touch the edges of the shield. See NATIONAL FLAGS.

Turkey. Gold on red, the Arabic cipher of the reigning sultan. See TOGHEA.

SOUTH AND CENTRAL AMERICA

Argentina. This is an oval coat of arms made by a wreath topped by a demisun in

splendor. The oval is divided by a horizontal line in the centre, with blue in the upper half and white below. A pair of hands clasped hold a staff, which is surmounted by a Phrygian cap, used here as the symbol of republican government.

Bolivia. A trophy of flags, three on a side, and the muzzles of four rifles with bayonets. The central space is an oval divided horizontally. The word Bolivia on the gold border of the upper half and nine stars on the blue border below. A landscape of mountain, sun, tree, sheep, and a garb occupy the centre, and a condor spreads its wings above the whole.

Brazil. A five-pointed star of green and white contains a central circle of blue on which the stars of the Southern Cross appear. The border contains 20 stars. The large star lies on golden rays with wreath of laurel, and an upright sword stands behind. The country's name is on a ribbon below.

Chile. A shield of blue (above) and red, bearing a single white star. Supporters an eagle and a stag, surmounted by three plumes, red, white, and blue.

Colombia. A trophy of flags, two on a side. A condor is above a shield containing in chief three gold cornucopias on blue; in fess a liberty cap, red on silver; in base a sea scene with ocean, harbor, ships, and land.

Costa Rica. A trophy of flags and weapons, a ribbon with the country's name, a shield with five golden stars, mountains, ocean, and harbor, with two ships. Above all a fillet with *América Central* on it.

Cuba. A shield, backed by the fasces and the liberty cap, surrounded by the laurel and a native shrub. In chief a landscape of rising sun in red and a golden key. Below the colors blue and white and a scene with a native tree and mountains in the rear.

Dominican Republic. A shield bearing a white cross, the quarters, blue and red alternately, showing a trophy of flags, a Bible, and a cross. A wreath of palm and native shrub. Below a blue ribbon has the country's name and the words *Dios patria libertad*.

Ecuador. A trophy of four flags, an oval with the fasces below and a condor above. In the oval are the sun amid the signs of the zodiac and a scene with mountains, sea, islands, and a steamer.

Guatemala. A wreath surrounding a scroll with the words *Libertad 15 de Setiembre 1821*, backed by guns, bayonets, and swords, forms the arms. The gaudily plumed quetzal is perched upon the scroll.

Haiti. A trophy of cannon, flags and rifles, drums and an anchor. The fasces, from which sprout palms, and above the liberty cap.

Honduras. A landscape with trees and habitations, two cornucopias, an oval bearing the words *Repca. de Honduras libre soberana independiente, 1821*.

Mexico. Above a wreath and standing on the prickly pear, an eagle rising, with a snake in its mouth.

Nicaragua. A trophy of flags, cannon, battle-axes, rifles, and bayonets, inclosed in a wreath of laurel, surrounds a triangle. A water scene with five islands and rising sun; the central island bears the liberty cap upon a pole.

Peru. A shield, in chief a llama gold on blue, a green cinchona tree on white, and below a gold cornucopia, filled with gold coins, on red. The

shield is surrounded by a spray of laurel and palm, with a wreath of the same above.

Salvador. A trophy of flags surrounded by a laurel wreath. A triangle with five mountains, the liberty cap with rays on a staff, the date, and a rainbow above the cap. The motto, *Dios—Unión—Libertad*. Completing the white circle of the badge, the words *Republica del Salvador en la América Central*.

Venezuela. A shield, in chief a garb of gold on red. The flag, with swords on gold. In base a white horse on green earth and backed by an azure sky. Above are two cornucopias, and the laurel and palm flank the shield. The motto gives the dates 1811 and 1864 for founding and independence.

ASIA

The emblems of Japan and China, though national in character, are not coats of arms in the ordinary sense, and naturally they cannot be heraldically described. They are not borne on a shield, and are not armorial bearings in the true meaning of the term. They correspond more nearly to what are called badges, and are emblematic.

China. The national emblem of China is a combination of many elements, but is not strictly a coat of arms. The principal element is the steel blade of a hatchet, colored pale blue. The edge is downward, and the hatchet indicates decisiveness. Upon the hatchet are 10 grains of rice (silver). Inclosed in a red space, bounded by a golden border of slightly diverging sides and pointed top, is a golden rice plant. This represents the nourishment or sustenance of the people. Perched on the sloping back of the hatchet, on the dexter side, is a flowery fowl, somewhat resembling a bird of paradise. The back is green and the breast red. This bird typifies beauty. About it are strands of green aquatic grass signifying purity. A sprig of the same plant is in the beak, while above its head are three stars, drawn like pearls. In one talon it holds a temple cup (silver), which has the symbolic meaning of filial piety. On the sinister side of the hatchet is a green dragon, meaning changeableness. Conventional three-tongued red bursts of flame over and below the dragon indicate brightness. In one claw is the silver cup of filial piety. Above the dragon's head, is a crescent moon, and above the whole is a representation of the great red sun. The (pearl) stars above the bird, the moon above the dragon, and the sun above them all typify light. The pointed top of the figure containing the rice plant on the hatchet is intended to suggest a mountain, standing for command. Below the edge of the hatchet, and woven about with artistically twining ribbons, is a curious zigzag symbol, made up of four parts, each like the block letter U laid on its side. These are placed back to back in pairs. It is a very ancient symbol, probably derived from the holding device or buckle for a priest's girdle or belt, and signifies sound judgment.

Japan. The personal badge of the Mikado is a golden chrysanthemum of 16 rays. In the standard it appears on the red ground of the flag, but it has no distinctive background on which it habitually stands. When used by a representative of the Mikado's government it may be displayed on any suitable or convenient color, or it may be shown without a background.

NATIONAL CEMETERIES. In the United States, cemeteries provided and maintained by the Federal government for the interment, free of cost, of officers, cadets, and enlisted men of the army, navy, marine corps, and revenue-cutter service, and army and navy paymaster clerks, who have died in the regular or volunteer service of the United States or who die after having been mustered out or honorably discharged. The same rights are accorded any nurses who are honorably discharged or pensioned. The presentation of the commission, warrant, or honorable discharge of the deceased officer, enlisted man, or army nurse, or the letter of appointment of the deceased army and navy paymaster clerk, signed by the Secretary of War or Navy, as the case may be, is sufficient authority for the interment. If the honorable discharge is not available as evidence of service, the interment may be made upon presentation of a pension certificate. Service as an officer or as an enlisted man in the State militia or National Guard, even though the decedent drew a pension on account of such service, does not entitle to interment in a national cemetery unless the organization was mustered into the service of the United States. When the statement of service shows the decedent to have been a general prisoner, a deserter, or a dishonorably discharged man, interment will not be made. Wives of officers and enlisted men may be interred in national cemeteries under regulations prescribed by the War Department. National cemeteries are under the charge of the quartermaster-general of the army, War Department, Washington, D. C., to whom all communications should be addressed. His representative is the officer of the quartermaster corps nearest the cemetery. Superintendents and assistant superintendents, who reside at the cemeteries, have immediate supervision thereof. They are usually selected and appointed by the quartermaster-general from among veterans of the Civil or other wars of the United States. They must be physically and mentally qualified for such duty. There are 84 cemeteries, all of which are within the continental limits of the United States, except one in the city of Mexico, Mexico. They are located as follows:

NATIONAL CIVIC FEDERATION, THE.

An organization of prominent representatives of capital, labor, and the general public, formed as the direct outgrowth of conventions held in Chicago and New York in 1900-01. Its purpose is to organize the best brains of the nation in an educational movement seeking the solution of some of the great problems related to social and industrial progress; to provide for study and discussion of questions of national import; to aid thus in the crystallization of the most enlightened public opinion, and, when desirable, to promote legislation in accordance therewith. In 1915 the work of the Federation was carried on through the following agencies: 1. The Industrial Conciliation Department, dealing entirely with strikes, lockouts, and trade agreements. Its membership included representatives of the general public and the leading organizations of employers and wage earners. The services of this department have been enlisted in more than 500 cases, involving every phase of industrial controversy. 2. The Industrial Economics Department, organized to promote discussion of practical economic and social problems. 3. Welfare Department, composed of employers of labor in stores, factories, mines, and on railroads, officials who have to do with the working conditions of public employees, chairmen of boards of health, heads of departments of public safety, leading physicians connected with public hospitals, heads of charity boards, and others. 4. The Woman's Department, composed largely of women who are themselves stockholders or who through family relationships are financially interested in industrial organizations. The object of this department is to use its influence in securing needed improvements in the working and living conditions of women and men wage earners in the various industries and governmental institutions and to cooperate, when practicable, in the general work of the Federation. 5. The Department on Compensation for Industrial Accidents and their Prevention, composed of employers, representative labor men, attorneys, insurance experts, economists, State officials, members of State compensation commissions, and others concerned. Its object is to advocate the amendment of State laws on employers' liability, with a view to securing uniform provisions looking towards compensation for industrial accidents, and to look into means of preventing accidents in commercial and manufacturing enterprises. 6. Social Insurance De-

partment, to investigate the need for uniformity of State legislation governing insurance plans relating to sickness, death benefits for widows and orphans, old-age pensions, or unemployment. 7. Department on Regulation of Combinations and Trusts, working for coordination of Federal and State laws and unification of the latter. 8. Department on Regulation of Interstate and Municipal Utilities. It has published *Commission Regulation of Public Utilities*, a compilation and analysis of laws of 43 States and of the Federal government for the regulation by central commissions of railroads and other public utilities. 9. The Pure Food and Drugs Department, composed of representatives of State food and dairy departments, public-health associations, and organizations of physicians, farmers, wage earners, and food and drug manufacturers, as well as large individual employers of labor. Its object is to promote uniform legislation on this subject among the States, work for effective cooperation between State and Federal governments, and stimulate the public to demand a better enforcement of existing laws.

NATIONAL COATS OF ARMS. See NATIONAL ARMS.

NATIONAL CONFERENCE OF CHARITIES AND CORRECTION. A body composed of the State boards of public charities, where they exist, of delegates appointed by the governors of other States, of charity organization societies and associated charities throughout the United States, and of persons connected officially or unofficially with charity work. It holds annual meetings in some city determined upon at a preceding meeting of the Conference. It has no formal constitution. The Conference maintains a bureau of information on all subjects concerning charity and corrections, and publishes annually its *Proceedings* and *National Bulletin*.

NATIONAL CONVENTION, IN FRENCH HISTORY. See CONVENTION, NATIONAL.

NATIONAL COVENANT. The league formed by the Scottish Presbyterians in 1638, being one of the famous covenants (qv).

NATIONAL DEBT. See DEBT, PUBLIC.

NATIONAL EDUCATION, SYSTEMS OF. A system of national education may be said to exist wherever the sovereign authority in a nation takes part in the establishment, maintenance, or to any considerable extent the regulation of the agencies for the education of the people. In ancient times and among the antique civilizations that survive to-day state systems of education are found. Such systems are (1) theocratic, where the priesthood, who form a ruling caste or are intimately connected therewith, carry on education, (2) examining, where the state conducts tests for citizenship or official position, thus indirectly determining the character of the instruction, or (3) martial, where the state aims to prepare its youth for citizenship, which is practically equivalent to membership in its army. The Roman government regulated education to some extent, and the emperors endowed many institutions of learning. With the fall of the Roman Empire and the appearance of the medieval ecclesiastical system, the Church assumed control of education in Europe and resented any encroachment of the state upon its domain. The Reformation, however, by placing wherever it prevailed the control of religion in the hands of

the state, transferred to the secular authority the control of education as well. The modern emphasis on the necessity of education for all, not only in religion, but also in letters, led to a broader popular education than had hitherto existed. The multiplication of sects that was an outcome of the Protestant movement brought about so much warfare regarding religious instruction that in most of the advanced nations it has largely or entirely disappeared from the curriculum of the state schools. Thus the modern systems, concerned principally with secular instruction, and controlled by the state, have come to exist.

The development of modern national support and control of education has in general followed this order: first the regulation, then the partial support, and finally the assumption by the state of almost the entire responsibility for the education within its borders.

The result of the vigorous efforts of the most progressive states within the nineteenth century is the almost entire disappearance of illiteracy within their borders. Germany, Switzerland, and Sweden find less than 1 per cent of their conscripts unable to read and write. In Holland, England, and France the proportion of illiteracy grows greater, 3.3 per cent of the French recruits in 1907 being ignorant of letters. In Italy the percentage of illiterate conscripts in 1905 was 30.06, and the marriage register shows that 38.7 per cent of the women called upon to sign it were unable to do so, of the total population over 21 years of age in 1911, 34.7 per cent of the males and 48.5 per cent of the females were illiterate. In Spain the percentage of illiteracy was estimated as 68 per cent in 1889, and this proportion was reduced about 10 per cent by 1900. In the United States in 1900, 10 per cent of the population over 10 years of age could neither read nor write, but this was reduced in 1910 to 7.7 per cent. This large proportion, however, is due to the enormous negro population and to extensive immigration from eastern and southern Europe. Only 7 per cent of the native population over 10 years of age was illiterate in 1900 and 10 years later only 3.7 per cent. Doubtless the proportion of illiterate adults whose parents were native would in America (if we exclude negroes) be about as small as that of illiterate conscripts in the European states having the most effective systems of popular education. In the two years 1913-15 strenuous efforts were made to eliminate illiteracy and classes for adults were established in the more backward parts of the country.

In 1912-13, 19.03 per cent of the population of the United States were enrolled in elementary schools. Canada and Switzerland show about the same percentages. Then follow England, Germany, the Netherlands, and Norway. Italy had only 9 per cent of her population in elementary schools in 1911, while in Russia this percentage was 3.6. The United States also leads in the amount expended for elementary education, whether we calculate the rate of expenditure per capita on the total population or per pupil on the enrollment in the schools. The average expenditure per pupil in average attendance in 1911-12 was \$36.30, about double that of either England, France, or Prussia. Italy spent, in 1902-03, \$5.30 per pupil; Russia still less. The United States spent on elementary education, in 1911-12, \$4.76 per capita on

the total population. England followed with about \$1.75 per capita. The statistics given above as well as those that follow are in each case the latest available. In making the comparisons differences in methods of arriving at the totals and other conditions must be taken into account.

CANADA

An outline of the technical and administrative features of the Canadian educational system will be found in the article CANADA. As therein stated, each province is left to legislate for its own educational affairs, but its exclusive lawmaking powers are subject to provisions which safeguard the educational rights of religious minorities as they existed in each province at Confederation (1867), and which in certain cases authorize remedial legislation by the Dominion Parliament. It is difficult to understand the Canadian system apart from its racial and religious factors. Ordinarily the fact that in regard to education each province regulates its own affairs would imply the purely provincial character of educational questions, but in Canada such questions are frequently of national importance and engage the passionate interest of the whole Dominion. The explanation is found in the proportion which (1) Canadians of French descent and (2) Canadians professing the Roman Catholic religion respectively bear to the whole population. In 1911, out of a total population of 7,206,643, the French numbered 2,054,890, or 28.51 per cent, while Roman Catholics of various races numbered 2,833,041, or 39.32 per cent. The result is that a dispute over the educational rights of the French minority in Manitoba at once becomes the intimate concern of the French majority in Quebec, while the increase of the French population in Ontario and the accompanying demand for bilingual schools excite in that province a Protestant reaction which is rapidly communicated to the other provinces. Politically speaking, therefore, an educational dispute in any province is liable to be taken up by racial or religious sympathizers throughout Canada. The educational ideals and practice imposed by the Roman Catholic hierarchy and those inherited by the English-speaking Protestants are the chief agencies by which the political rivalry of two civilizations under one flag is carried on. So long as this continues there is not likely to be any bridging of the educational gap between the Roman Catholic elementary schools, the Quebec classical colleges, and Laval University on the one hand and the English-speaking public schools and the unsectarian universities, whether provincial or of private foundation, on the other. The former are under strict, centralized ecclesiastical direction, the latter are under popular control, provincial and local.

Before 1900 the demand for bilingual schools was commonly made only in behalf of the French-Canadian population. Afterward it became more aggressive, and evidence of its indeluctable motive was afforded by the French Language Congress of 1912 at the city of Quebec, which was attended by a thousand delegates from all parts of the continent where French is spoken. Since the beginning of the twentieth century the increasing volume and variety of immigration have extended the demand to include Germans and the different Slav

and Scandinavian races. In Manitoba (q.v.) the problem is highly complicated. Bilingual schools are found in districts where the French, German, Polish, Ruthenian, and other nationalities are largely represented. These schools are not legal in Alberta and Saskatchewan, but the demand for them is such that a further increase of foreign immigrants cannot but suggest the political recognition of educational privileges similar to those enjoyed by the French-speaking population. In Ontario, Manitoba, Alberta, and Saskatchewan—British Columbia, and the Maritime Provinces are but slightly affected by this question, and Quebec has a place by itself—the position of the different governments, which most probably would be reflected by the preponderant sentiment of the whole country in a federal election, may be said to be unalterably fixed in favor of assuring English elementary schools for the people and the predominance of the English language in public-school teaching. But this has proved to be quite consistent with a liberal educational recognition of the languages and religious beliefs of the various races which compose the Dominion of Canada. Consult the *Educational Reports* of the different provincial governments.

FRANCE

The system of public instruction in France comprises three departments—primary, secondary, and higher. They are all under centralized control. At the head of the system stands the Minister of Public Instruction, who is a cabinet officer. Each of the great departments has a special director. The central administration includes, in addition, the Superior Council of Public Instruction and the general inspectors. The Superior Council consists of about 60 members, and has advisory and judicial functions. One-fourth of its members are appointed by the President. Other vacancies are filled by the Council itself. It has a committee to consult with the school authorities regarding school matters. Officials exist for the inspection of every phase of school work.

For convenience in educational administration France (including Algeria) is organized into 17 academies. Each one comprises a university, associated lycées and colleges, and the public primary schools within its limits. At the head are a rector, an academic council, composed of professors and officers of education, and an academic inspector. Under the academic inspectors serve the primary inspectors, who come in direct touch with the schools, each one having supervision of about 150. The departments of France, including Algiers, of which there are 90, constitute the next division for school administration. The prefect has the power of appointing elementary teachers, and there is an advisory council for primary schools, composed of teachers, school inspectors, and members of the civic council. In the communes the councils and mayors select sites for school buildings and vote the funds for the communal school expenditures. There are also committees formed to encourage school attendance.

It has been said that the control of schools in France is highly centralized. The President of the Republic appoints the Minister of Instruction, the general inspectors, the professors in the universities, the rectors of the academies, the prefects of the departments. The Minister of

Public Instruction appoints the rest of the officials of the central department, the central examination boards, the academy inspectors, the primary inspectors, the secondary teachers, the officials in the normal schools and in the superior elementary schools. The entire body of educational officials is therefore practically in the hands of the President, the Minister of Public Instruction, and the academic inspector.

The Superior Council deals with programmes for instruction, regulations for discipline, teaching, and school management generally, and hears appeals from the lower councils regarding schools that have been suppressed or have not been sanctioned by the lower authorities. It is the high court of appeal in all contentions. The academic council oversees courses of instruction in either higher or secondary schools, judges cases involving discipline of teachers or pupils therein, or the establishment or suppression of secondary schools. The departmental council has similar functions regarding the primary schools and determines their establishment, location, and the number of teachers. It also inspects them.

By the laws of 1890 and 1896 universities have been organized in each academy. Preparatory to them are lycées, or secondary schools maintained by the state, of which there were in 1912 for boys 112 and for girls 53, communal colleges, or secondary schools maintained by the local authorities, for boys, of which there were 230; and colleges for girls, numbering at that date 79. All these institutions take both boarders and day pupils. Besides these there were 57 secondary courses for girls. The primary schools may be grouped under five heads: (1) The *maternal schools*, which receive children between two and six years of age. From being schools for taking care of children whose mothers were out at service, they have become part of the educational scheme. They are supplemented by infant classes, which prepare the children for the elementary schools, and take the place of the maternal schools in small communities. To them are admitted children from four to seven years of age. (2) The *elementary primary schools* (*écoles primaires élémentaires*). These take children from 6 to 13, the work being divided into three grades of two years each. (3) The *superior primary schools* (*écoles primaires supérieures*). The place of these may be taken by the "complementary courses." The latter are partly review courses, partly advanced, with special attention to training for practical life. In them instruction lasts two years. There are two classes of superior primary schools—the professional and the nonprofessional. The first class includes commercial, technical, and industrial schools. The second has an advanced, liberal course for three years, supplementing it by considerable technical and industrial work during the rest of the time. It takes pupils from 12 to 18. It was originally designed to prepare for the secondary schools, but having a somewhat similar course, and being less aristocratic, it failed. It was revived with the addition of the vocational training in 1886. (4) The *apprentice schools*, which are sometimes classified as superior primary schools. Their name indicates their function, actual shop work being the centre of the curriculum. (5) The *primary normal schools*. Besides these there are two higher normal schools, which prepare teachers for the primary normal schools and the superior primary schools. There are 84 primary normal

schools for men and 82 for women. They give a three years' course. The primary-school system is further supplemented by courses for adults offering either elementary, technical, or commercial instruction or lectures on subjects of general culture.

In the primary schools tuition is free. Moreover, by the Law of 1867 a fund to help pupils whose parents cannot supply them with clothes, books, etc., was created. Its establishment in each commune was decreed in 1882, the state agreeing to contribute. It is distributed by local committees, and in many cases children at school are even provided with dinners. In the superior primary schools bursaries exist to support deserving pupils taking the courses. At the age of 16 the holders of bursaries may be transferred to secondary schools with a continuation of their stipends. Bursaries also exist in the secondary schools, awarded on examination to students of limited means. Students are admitted to the normal schools on competitive examination. They are supported while there, and, when they graduate, are pledged to teach 10 years. They receive positions in the order of merit. Secondary and higher schools charge tuition, but, as they are largely provided for by the state, the amount of this is small.

The salaries of all administrators of schools, inspectors, and, except in the case of the communal colleges and in cities having over 150,000 inhabitants, teachers as well, are paid by the state. This brings about general uniformity. The salaries of primary teachers range from \$220 to \$540 a year, of normal school teachers from \$500 to \$1100, of professors in the lycées from \$650 to \$1720, of professors in the universities from \$2400 to \$3000. In primary schools of all kinds the teachers are divided, according to length of service and efficiency, into five grades, and in lycées into four. Salaries are based on this ranking. The teachers may, when they have served 30 years, and have reached the age of 60, receive a pension which amounts to one-sixtieth of the average salary during the last six years multiplied by the number of years served. To make up for this they contribute to a pension fund 5 per cent of their yearly salaries plus one-twelfth of their first year's salary and one-twelfth of each increase in salary for the first year of such increase. In addition to paying salaries and pensions the state supports the normal schools, the buildings for which are erected and equipped by the departments. The departments also furnish the supplies for them, and pay the office expenses incurred in running the departmental bureaux and the academic bureau of inspection. The communes pay for the supplies of the primary schools and local school officials, for janitors, and for the building and equipping of schools and residences for masters. In the building of primary schools, however, a state loan is available, the amount of which depends on the necessities of the commune, and varies from 15 to 80 per cent of the total cost of the work. The state also loans money to build normal schools. The universities, since their organization in the academies in 1896, have been thrown somewhat on their own resources and those of their localities. The state no longer equips laboratories or libraries, nor maintains new courses, nor builds new buildings.

The courses of study in the primary schools are in general determined by state laws. In addition, the Minister of Public Instruction, in

consultation with the Superior Council, determines the programmes of instruction even in details of considerable minuteness, and also rules for the conduct of the schools. The courses of study for the secondary schools are laid down by law, and the entire course occupies 11 years. Four years are spent in the primary department, and pupils can take this work in the free primary schools. They will, however, be under the disadvantage of not taking a course of three years in a modern language. The secondary school proper has a course of seven years, divided into two parts. During the first four years the work may be in either of two courses, in one of which Latin is obligatory and Greek optional and in the other neither is taken. For the last three years there are four courses presented for choice. These courses emphasize respectively Latin-Greek, Latin-modern languages, Latin-science, and science-modern languages. During the last year of the course options in either philosophy or mathematics are offered.

The programmes in all the secondary schools of France are rigidly laid down by statutes and regulations of the central Department of Education, and generally uniformity exists.

The system of inspection in France comes in to insure this uniformity in curriculum and methods. It extends to sanitary conditions as well as to instruction, although such inspection is in the hands of the regular medical inspectors of the localities. Uniformity of results is brought about by a regular system of examinations carried on by outside authorities. An examination for a certificate of primary studies may be given to pupils at the age of 11, and those passing are exempt from further compulsory attendance. It is carried on in the cantons by examiners appointed by the rectors of the academies. A special departmental commission holds yearly an examination for certificates in higher primary studies. The secondary schools also have their final examinations for the *baccalauréat*, conducted by outside examiners. Indeed, as the primary schools are the product of the central republican governments of France, so the lycées are part of the Imperial scheme of education devised by Napoleon, and both therefore are characterized by the system, uniformity, and dependence on central authority that their origin would insure.

Private schools in France require the sanction of the state, but can receive no support from public funds. The mayor or academic inspector can oppose them in the interests of hygiene, morals, or public order. They are free in regard to their programmes and methods, but their teachers must have received the certificate of capacity. For the most part they have been under the control of religious orders or congregations, and their large attendance was due to the demand for more religious instruction on the part of some classes. These congregations, however, were alleged to be in many cases hostile to the Republic. The Catholic orders were particularly aimed at in this charge. The ministry of Waldeck-Rousseau attacked their independence in the Law of Associations that became law on July 1, 1901. By it all congregations were required to obtain official authorization in order to get legal recognition as such. All unauthorized congregations were absolutely forbidden to give instruction. By this means a careful scrutiny of the conduct of the affairs of such bodies was made possible, and the character of their in-

struction inspected. The law contemplated the suppression of all congregations that resisted such scrutiny. During the year 1901-02 the ministry presided over by Premier Combes compelled many thousands of unauthorized clerical schools to close their doors. The Act of July 8, 1904, determined that within a period of 10 years from its promulgation all congregational teaching must cease.

The universities of France are discussed more at length under UNIVERSITY.

GREAT BRITAIN

The foundation of the present system is the Elementary Education Act of 1870. It declared that each district where sufficient facilities for elementary instruction were not in existence should provide them. Schools requiring denominational instruction or charging more than ninepence a week for tuition were not regarded as providing sufficient means for this purpose. The Education Department was required to make a statement of what was in each case demanded. In case voluntary provision to meet these demands was not forthcoming, a school board was to be elected in the district, which was to provide, to maintain, and to keep efficient the requisite elementary schools. Children attending board schools were to pay a weekly fee determined by the board, with the consent of the department, but this was to be omitted where parents were regarded as unable to pay. School boards were permitted to make provision for the compulsory attendance of children between 5 and 13 years of age, who were not elsewhere receiving efficient instruction, unless these children had attained the requisite standard of scholarship or were exempt under the Factory Acts. The board schools were to give no denominational instruction. The funds for the support of elementary schools were to be at the disposal of the boards, and were to be derived from parliamentary grants, loans, fees, and local rates. Power was given to the school boards to fix the amount of the local contribution for school purposes. Voluntary schools, wherever they existed, were recognized as before, and, in case they remained properly public and elementary, were to receive grants not greater than the amount contributed from other sources. Local rates were not to be levied for voluntary schools. In 1876 the age of compulsory education was extended to 14 years, and provision was made for the more effective enforcement of the law by punishing delinquents. This law was also made to apply to districts where there were no school boards, and it was enacted that children under 10 years of age should not be regularly employed at labor. In 1880 boards were required to make attendance compulsory. Subsequent legislation improved the evening schools (qv), turning their attention to technical and industrial education, started undenominational day training colleges, and greatly developed technical instruction. The poorer rural elementary schools have also received especial help. In 1890 the payment of tuition fees in elementary schools was abolished. In 1899 the Education Department was replaced by a Board of Education for England and Wales consisting of a president, the Lord President of the Council, the principal Secretaries of State, and the Chancellor of the Exchequer. The Act of 1902, which applies everywhere except to London (provided

or under a separate act) swept away the old school boards and attendance committees and replaced them by education authorities which are empowered to provide for all the schools in their respective districts out of the local rates. What-
ever schools receive such support are under the general supervision of the local education authority. This authority is the council of the county, the county borough, noncounty borough with a population of over 10,000, or the urban districts with a population of over 20,000. It has the right of levying the local rate and

borrowing money for school purposes, but hands over to a committee all other educational functions. The Education Committee is appointed according to a scheme determined by the local authority and approved by the Board of Education. A majority of its members are in most cases appointed by the council from its own number. Some of the others must be persons of experience in education, and the committee must include women. The Education Committee has power to determine the secular education to be given in the public elementary schools and to fix the number and educational qualifications of the teachers. Its consent is necessary to the appointment or dismissal of teachers except where religious considerations are involved.

Each school is under a board of managers, who elect teachers, control the school property, and determine the school fees. The schools provided for wholly by the education authority are governed by managers appointed by it and by local authorities. Moreover, the denominational schools have on their managerial boards appointees from both these sources. No school that does not comply with the requirements of the Education Committee can receive even a government grant.

Parliament grants to all schools as grants in aid a sum equal to four shillings per scholar, and an additional three halfpence per scholar for every complete twopence per scholar by which the amount which would be produced by a penny rate in the area of the authority falls short of four shillings a scholar. Besides this grant the government also pays an annual grant of 13s. 4d. for children under five years of age and 21s. 4d. for children over this age; grants for instruction in special subjects, e.g., cookery, handicrafts, domestic science, etc.; grants for areas with all populations, and a fee grant of about 10s. per head for all children in schools complying with the conditions laid down in the Elementary Education Act of 1891. Whatever tuition fees are paid to schools maintained by an education authority are turned over to it, but a certain portion of these, such as may be agreed upon, is returned to the managers of the school. The proceeds of school endowments for the aid of elementary education are primarily devoted to the care of the school property. Whatever surplus there may be is turned over to the education authority.

Great progress has been made in English elementary education since 1902, largely in the direction of enriching the curriculum, providing instruction in special subjects to older children, developing manual work in all grades, paying greater attention to physical training and games, improving the schoolbuildings, and reducing the size of classes. Much social work is done through the schools; e.g., under the Education (Provision of Meals) Act, 1906, local authorities are empowered to provide meals to poor children,

while under the Education (Administrative Provisions) Act, 1907, medical inspection is provided. More recently they have been permitted by the regulations to establish juvenile labor bureaus to offer vocational guidance to children on leaving school.

For pupils who cannot proceed to secondary schools and wish to continue their schooling beyond the elementary schools, there are the higher elementary schools. The length of the course is three years and the nature of the work is as a rule vocational. Owing to the restrictive character of the regulations of the Board of Education in the matter of higher elementary schools, a new type of intermediate school, known as central schools, with four-year industrial or commercial courses, has sprung up in London, Liverpool, Manchester, and elsewhere.

The managers of denominational schools are allowed to determine the religious instruction given therein and the religious qualifications of the teachers. But a pupil need not attend such instruction, and cannot be excluded from the school for religious reasons.

The Act of 1902 was bitterly opposed by the Nonconformists. The voluntary schools are largely under the control of the Church of England, and the use of a local rate for their support was regarded as taxing Nonconformists for the benefit of the institutions of the Established Church.

For the training of elementary teachers there was in 1911-12 a total of 87 training colleges, of which 18 were attached to some university or college of university rank. Teachers are appointed by the education committees, usually on the nomination of the local school managers or the principals, who are always consulted. The average annual salary of certificated masters is about £121 and of mistresses about £80. In 1898 provision was made for pensioning teachers who have reached the age of 65 or have become disabled. The amount is estimated on the basis of length of service, and is partly made up by an annual contribution on the part of men of £3 and of women £2. Government inspectors are appointed by the crown on recommendation of the Board of Education, but besides the government system of inspection a local system has been developed in the larger areas, corresponding in some measure to supervisors or assistant superintendents in large American school systems. The pupil teachers constitute a large proportion of the teaching staff, the law allowing three for the principal teacher in each school and one for every certificated assistant teacher. The system of grants in aid of their training still prevails.

For secondary education England has schools under a variety of authorities. They may be classified, according to method of control, as private enterprise schools, subscribers' schools, companies' schools, endowed schools, and municipal secondary schools under local authorities. There were 6209 such schools in England in 1897. They are not organized under any system, except that the charity and other commissions have been revising the courses of study in the endowed schools. (See ENDOWED SCHOOLS ACTS.) The Public Schools Act of 1868 revised the control and organization of seven great public boarding schools of England. Wales and Monmouthshire have a system of inspection of secondary schools. One of the main purposes of the Act of 1902 was the support of secondary education by public

money. The education authorities are authorized to consider within their areas the needs of secondary education and to take such steps as seem to them desirable, after consulting the Board of Education, to supply or aid in the supply of such instruction. For this purpose the county authorities are empowered to raise a county rate of twopence in the pound, a sum that may be increased with the consent of the Local Government Board. This measure has led to the development of a large number of secondary schools under local authorities and to the more adequate provision of secondary-school facilities for girls. The Board of Education has issued regulations for the management and organization of secondary schools, the two main requirements being the provision of a certain percentage of free places for pupils from elementary schools and the acceptance of inspection by the board. Schools which accept these regulations receive a government grant. A large number of secondary schools which submit to inspection by the board but are unwilling to comply with the remaining requirements are further classed as "efficient," but receive no grant. In 1911-12 there were 995 grant-earning schools and 102 schools recognized as efficient.

The Scotch have had a public elementary system since 1696, when it was ordained that a school should be established in every parish where one was not in existence. The masters were elected by the landowners and the ministers, and held their places for life or good behavior. The act was amended in 1803 so as to require the salaries of masters to be raised, and in 1861 their examination for the right to teach was transferred from the control of the presbyteries to that of the universities. In the meantime considerable support was granted to the schools by the government. Among other changes the English School Code of 1861 was applied in Scotland, but was withdrawn. In 1872 an elementary-education act like the English one was passed. The Scottish law is the better of the two, however, school boards being created in every parish, and the practical control of all elementary schools being given to them. In 1893, after several movements in that direction, all children between 3 and 15 years of age were freed from school fees in the public elementary schools. Education is compulsory for children between 5 and 14 years of age. In 1906 a new classification of schools was adopted—primary, intermediate, and secondary. The primary school receives pupils up to the age of 14, but pupils may take a qualifying examination at the age of 12 and on passing this may elect to continue in a supplementary course (commercial, industrial, rural, or domestic) intended for those leaving at the age of 14, in an intermediate course of three years (12 to 15) which is practically the first stage of a secondary school, or in a secondary school providing a course of at least five years.

The government grants to Scottish voluntary and board schools are, in general, similar to those in England, but only about one-eighth of the elementary schools are voluntary. For the training of elementary teachers denominational colleges had made their appearance before 1839. These have been aided by government grants, and at present over four-fifths of the male and two-thirds of the female teachers have graduated therefrom. The English Pension Act of 1898 was extended to Scotland.

The secondary instruction in Scotland is in the hands of five classes of schools—burgh schools, academies, parochial schools, mixed burgh and parochial schools, and four public boarding schools like those of England. The burgh schools are supported either by endowment or by burgh funds. They are under the control of the authorities of the burgh and are open to the community. Until 1861 the presbyteries controlled them, but at that date this power was transferred to the town councils, and in 1872 to the school boards. These bodies fix the fees. The academies arose in the middle of the eighteenth century as a result of a demand for more economical and scientific instruction. In most cases they came ultimately under the joint control of town councils and proprietors. In 1892 government grants were made to secondary schools, and their inspection was provided for. At the same time secondary-education committees were established as district committees in the 33 counties, the 5 chief burghs, and 1 large parish. These committees are concerned with the distribution in their districts of the government grants, now paid under the Education (Scotland) Fund, 1908, and with all forms of education beyond the resources of individual school boards. Since 1888 the Education Department conducts an examination in the courses provided in the secondary schools leading to the leaving certificate, which under certain conditions is accepted for entrance to the universities. In 1911-12 there were 56 grant-receiving schools, of which 35 were maintained by school boards. For the universities of Great Britain, which through the development of a large number of new degree-granting bodies since 1900 have had a remarkable growth, see UNIVERSITY.

For a further treatment of the English educational system, see GREAT BRITAIN, *Education*.

The educational system of Ireland is distinct from that of England and Scotland. Elementary education is controlled by the National Board, which was founded in 1831. The schools are administered and maintained on denominational lines, but a compulsory conscience clause exists under which pupils are exempted from religious instruction when their beliefs conflict with it. The usual subjects of elementary instruction are given. Irish has developed rapidly in the elementary schools since 1900 and is now studied by more than 200,000 pupils. Under the encouragement of the Department of Agriculture and Technical Instruction domestic-science subjects and manual instruction have also been introduced. In 1912 there were 8255 elementary schools with 668,974 pupils on the roll and an average attendance of 499,038 pupils. The denominational distribution is indicated in the following figures: 4397 schools were attended by 373,154 pupils of the Roman Catholic faith—1549 by 117,985 pupils of the Protestant faith—and 2303 schools were mixed and were attended by 177,579 pupils. The expenditure out of Imperial taxes and rates on elementary education in 1912-13 was \$8,829,185.

Secondary or intermediate education is under the supervision of the Intermediate Education Board, which conducts examinations of pupils in secondary-school subjects, on the basis of which grants are distributed, and also, since 1909, inspects schools. The Roman Catholic schools are conducted largely by teaching orders of that denomination, but recently the board is insisting on the appointment of a number of lay

teachers as a condition of the grant. In 1912 the board examined 12,581 pupils (8276 boys and 4305 girls). The expenditure of the board in grants for intermediate education in 1912 was \$250,990.

Technical and agricultural education is supervised and subsidized by the Department of Agriculture and Technical Instruction, which, since its establishment in 1900, has greatly assisted the development of technical schools and the teaching of agriculture, science, domestic subjects, drawing, and manual training, not only in the technical schools but also in evening schools and in day secondary and elementary schools. For higher education in Ireland, see under UNIVERSITY.

HOLLAND

The state school system in Holland includes public primary schools, normal schools and courses, burgher schools, higher burgher schools, or secondary schools proper, industrial and technical schools, agricultural schools, and various professional institutions, together with Gymnasias, and three state universities. A few of the primary schools are maintained solely by the general government. Most of them are communal, but a considerable portion of the fund for their support comes from the state. Private primary schools are also subsidized by the government, in case they maintain proper standards. The primary-school system includes, in addition, repetition and evening schools, and both types are maintained by the same agencies and methods as the primary schools in general. So, too, the normal schools are either government schools, or communal schools with subsidies or private schools with similar support. The state normal schools, however, give instruction to the majority of the students taking such courses. The higher burgher schools were, in 1910, 81 in number. Of these 27 were maintained by the government, 47 were communal, and 7 private schools. There were in addition 61 Gymnasias or classical schools (30 publicly and 31 privately maintained).

The history of this school system will serve to explain these peculiarities and also to make somewhat clearer the complexities of the system itself. In 1784 a Society of Public Good was founded at Groningen by John Nieuvenhuysen. Its object was to promote elementary education, and in this it was successful, receiving help from the government. In 1806 an education law of great importance was passed. It consisted essentially of provisions for inspecting schools and examining and certificating teachers. School districts were organized, over each of which an inspector was placed, whose consent was requisite before any one could teach or be a member of a school committee. The inspectors received for their services only an allowance for their expenses. A principal duty was that of examining teachers for certificates. The provincial and communal administrations were urged by the government to provide the means of instruction in their localities, to insure a comfortable subsistence for teachers, and to obtain a regular attendance of children in the schools. Free schools for the poor were, as a result, established in the towns and in the villages—schools to which the poor were admitted gratuitously. The authorities made great and successful efforts to gain a large attendance, and teachers were paid better salaries than elsewhere in Europe. In 1811 M.

Cuvier found 4511 primary schools in existence, and 1 in each 10 of the population in school.

Up to 1848 only two important steps had been taken in the further development of the system. Normal schools were established in 1816, and the free schools for the poor were supplemented by institutions of a somewhat higher grade where a small tuition fee was required. Since the free schools could be entered only by those who possessed a certificate of poverty, the children of people with moderate means were excluded from them. The private schools for such children were fast becoming inferior to the free schools which were under public patronage, and it was to supply this want that the towns established intermediate schools (*tusschen scholen*). In addition, French schools, which emphasized modern languages and commercial branches, and Latin schools, preparing for the universities, were founded.

The constitution of 1848 established liberty of instruction. This conflicted with the provision of the Law of 1806 that the authorizations of the municipal council and of the inspector were necessary for even the teacher in a private school. In 1857 this requirement was removed, only the general admission certificate being demanded in such cases. The constitution of 1848, also, by placing all religious denominations on a footing of equality, gave to the Catholics and liberals a chance to attack the religious instruction in the schools, which according to the Law of 1806 was to have been Christian but undenominational. Their agitation led to a strict enforcement of the law, which in turn roused the antagonism of the orthodox Protestants. The result of a bitter contest was the Law of 1857, which reaffirmed that of 1806, making more explicit its provision that religious instruction, while undenominational, should yet inculcate Christian virtues. It was also provided that the schoolrooms should at special hours be put at the disposal of religious communions for purposes of instruction. This attitude was confirmed by the Law of 1878.

Under the Law of 1857 each commune was required to maintain at its own charge what in the opinion of the state's deputies and the supreme government was a sufficient number of primary schools. If this task was too heavy, the state and the province were to share equally in a grant of aid. It was provided that pupil teachers should aid in the work of instruction. School fees were to be exacted only of those who could afford to pay them. The public schoolmaster was to be selected by the communal council from a list of those who had acquitted themselves best in a competitive examination. A salaried provincial inspector was substituted for the provincial commission of district inspectors. The Minister of the Home Department, assisted by a referendary, was made the supreme authority in matters connected with education.

In 1863 a law was passed organizing secondary instruction as consisting of burgher, higher burgher, agricultural, polytechnical, and industrial schools. This law was amended in 1876 and 1879. The secondary schools are under special commissions and inspectors, and teachers in them are required to have special diplomas and, except in a few cases, to be university graduates.

The Law of 1857 has been twice amended—in 1878 and 1889. In 1878 the school authorities were empowered to increase the curriculum as laid down in 1857, by French, German, English,

general history, mathematics, drawing, agriculture, and gymnastics, whenever they deemed it expedient. It was also provided that each commune should support the necessary number of unsectarian schools, but 30 per cent of its educational expenditures were to be contributed by the state, which also undertook to subsidize private schools under certain conditions. An enormous increase in the state contribution to popular education was thus brought about. In 1889 the method of granting the state subsidy was modified so as to include private schools as well. If the school applying for one is found on inspection to conform to the state regulations, it will be granted an amount dependent on the attendance, the number of teachers, and extent of the curriculum. All schools having more than 41 pupils must have at least two teachers, and an additional teacher is required for an average addition of about 50 pupils. When schools have more than the minimum requirement of teachers, and when they cover more than the required curriculum, additional grants are given. The state also furnishes 25 per cent of the amount necessary to establish a school, and regulates the character and hygienic conditions of the buildings and premises. The Law of 1878 instituted a system of pensions for teachers who had reached the age of 65. The annual amount is one-sixtieth of the annual salary for each year of service. The teachers contribute 2 per cent of their yearly salaries to a pension fund.

The Dutch classify their Gymnasias together with their universities under the head of superior instruction. Such instruction is organized into a system by the Law of 1876. The three state universities are supported and controlled by the national government. See UNIVERSITY.

PRUSSIA

The school system of Prussia may be divided into three departments—elementary, secondary, and higher. The elementary system is designed to educate children of the lower classes whose school training is completed in early years. The secondary schools are intended to prepare pupils for the universities or professional schools, which are for the most part classed as superior schools. The elementary school system may be grouped under five classes: (1) The *infant schools*. These are not supported by state funds, nor are the teachers required to have state certificates of capacity. They are, however, under the supervision of local school boards. Their purpose is to care for children whose parents are obliged to go out to work. Children are admitted ordinarily only in their third year, but in some cases even younger children are cared for. (2) The *Volksschule*. This takes children between the ages of 6 and 14, and during this period attendance is compulsory for all whose education is not otherwise provided. In the larger communities the sexes are taught separately, but in the country districts this is usually impossible on account of the lack of teachers and facilities. The school work occupies six hours a day and about 42 weeks a year. There are three stages and six to eight classes, though the work occupies eight years. The subjects of study are, in the lower stage, religion, German, arithmetic, singing, gymnastics, and needlework; in the middle stage, drawing, science, history, and geography are added, and in the upper stage, geometry. This course is prescribed by

law, but within its limits selection and arrangement are left to the school board of the district, subject to the approval of the general board of the royal government. (3) The *continuation schools* give instruction to pupils between the ages of 14 and 18. They review the work of the *Volksschule* and give some additional work with special reference to trade or industry, or, in the country districts, agriculture. The schools are conducted so far as possible during the day and may not be held after 8 or 8:30 P.M. The tendency is to link up the work with the vocation of the students, and the aim is to secure general efficiency in the vocation and intelligent citizenship. Tuition is charged, but provision is made for those who cannot pay. With the continuation schools may be classed various industrial and trade schools which are day schools and devote more time and effort to prepare for specific vocations. (4) *Middle schools*. These sprang from the old burgher schools of the Middle Ages. They aim to prepare the children of people with more means for a commercial life, although sometimes they are attended by pupils preparing for the secondary schools. Tuition is charged. They continue and broaden the curriculum of the elementary schools and add one foreign language. Nearly twice as many of these schools as are public are private. A considerable proportion of them are mixed schools. They take the place of the *Volksschule*, but sometimes continue instruction until the seventeenth year. They have, however, not been marked by great success in Prussia, because no privileges are attached to graduation from these schools, and a pupil who can remain at school long enough prefers to attend a secondary school. (5) *Normal schools*. In these there is a preparatory course of three years to which children of 14 are admitted. This is followed by a two years' course in the women's normals and a three years' course in men's normals and the one for governesses. In 1913 there were 212 of these institutions, of which all but about 26 were for men exclusively. Students are admitted on examination, and the attendance is limited to from 30 to 36 in each class. While in the school students receive their support. On graduation they are placed on the list of available teachers and are required to take what is given them or pay back the expenses of their education. Before receiving permanent appointment, however, a probation of from two or five years is required, and an additional examination on educational matters must be passed. The normal-school course consists of pedagogics, religion, German, history, arithmetic, geometry, geography, drawing, writing, music, and a foreign language.

The secondary schools in Prussia, as in Germany generally, are the various classes of Gymnasias and Realschulen. The Gymnasium has a nine years' course. To enter it the pupil must be nine years of age and have had three years of elementary instruction. The Progymnasias give a somewhat shorter course, usually only the six years necessary to gain for their graduates exemption from one year of the voluntary service in the army. Occupying a position between the Gymnasium and the Realschule is the Realgymnasium, which omits Greek and gives more attention to sciences, etc. There are also Realprogymnasias. The Realschule proper gives only a six years' course, but the Oberrealschulen have nine years of work. As a result of a conference on secondary schools that met at Berlin

in 1900, the three classes of schools having a nine years' course are declared to be equal from the point of view of general culture and for purposes of matriculation at the universities, and Greek was made optional in the Gymnasia. The programme of studies was somewhat revised and greater latitude allowed the masters in adapting their work to particular needs. An important feature of secondary education in Germany is the privileges which are secured by the examinations. (1) The *Einjährigenschein* is obtained on an examination after six years of secondary work and entitles the holder to serve in a regiment of his choice for one year only. (2) The *Abiturientenexamen*, or leaving examination, entitles students who pass it to enter the universities or higher technical schools without further examination, with certain minor exceptions. The secondary education of girls has been reformed and has come increasingly under public control. Opportunity is now afforded since the regulations of 1908 for girls to continue their higher education beyond the age of 15 as formerly in the *Höhere Mädchenschulen*. Not only can they specialize in domestic science or for the teaching profession, but they may take secondary courses leading to the universities, similar to those open to boys.

The higher education of Prussia is given in the universities with their four faculties of philosophy, theology, law, and medicine. They are discussed in the article on UNIVERSITY. There are also various polytechnic and agricultural schools that may be included with the institutions for higher education.

At the head of the Prussian school system is the Ministry for Public Worship and Education, the former charge over public health having been removed in 1911 by the creation of a department of public health. For educational purposes two divisions are maintained in the Ministry. The first has control of superior and secondary instruction and the second of the elementary schools. The Minister of Education represents the schools in the Prussian Parliament and plans and oversees legislation on school matters, including finance. He distributes the state school money, appoints the members of provincial school boards, confers titles on school officers, judges on appeal all cases involving dismissal from office or other contentions in school matters, besides fixing the normal course of study. Each of the 13 provinces of Prussia constitutes a division for the administration of secondary education and training of teachers. The immediate superintendence of secondary schools is in charge of the provincial school boards, consisting of from three to five members and a chairman, who is the president of the province. One of these men inspects the *Gymnasien*, another the *Realschulen*, and a third the normal schools. This board has the power of appointing and dismissing teachers in secondary schools, except in such as are supported wholly or partly by private funds, where the selection is made by a local board from a list furnished by the provincial school board. The appointment of directors of the schools requires the confirmation of the Minister. To the provincial school boards also fall the control of the seminaries for the training of secondary teachers and the regulation for all the schools of the province, of the school programmes, regulations, leaving examinations, and of textbooks for the higher schools. In each province the general superintendent of the Evan-

gelical church has the function of inspecting the Protestant religious instruction in the secondary schools, and a Catholic bishop has a similar right regarding Catholic instruction. The provinces of Prussia are divided into 36 governments, each of which has a school board consisting of two men appointed by the King for life, four appointed by the provincial school board for six years, and the president of the royal government. In such schools as are supported largely by the state this board appoints the teachers. Wherever, on account of extensive local support or private patronage, local authorities are given the naming of teachers, the school board of the government confirms their appointment or nominates a list from which the selection must be made. It also oversees the conduct and work of the teachers, superintends the elementary schools generally, settles upon new districts and textbooks for local schools. The governments are divided into districts, some of which have inspectors, whom the Minister on examination appoints for life, and who devote their whole time to the schools. Other districts have a number of local inspectors, who until recently were clergymen or had some other occupation besides that of school inspection. The tendency is more and more to appoint inspectors of professional experience. The district has a school board composed variously in different localities of inspectors, members of local councils, and representatives of religious denominations. This board has the power of erecting and organizing schools, determining teachers' salaries (the minimum being fixed by the government), increasing salaries and pensions, and deciding on property liable to a school tax. Each school has a local school board chosen in cities by the central school board. Sometimes, however, it is chosen by the citizens of a community or by a church organization or by a patron, generally according to the source whence the school derives the larger part of its income. The local board looks after repairs, supplies, and attendance, but cannot interfere with the internal management of the school. In many cases it has a voice in electing the teacher or fixing his salary. Many cities have established secondary schools, the funds for which are largely contributed by them. Here the local boards have charge of financial matters, choice of teachers, etc., but the work of the school itself is under the supervision of the provincial boards. The most extreme cases of local control arise in connection with the country *Volksschulen*, under the patronage of the nobility. Here the patron names the teacher, and sometimes even interferes with the course of study and school hours.

Private schools in Prussia are required to conform to state regulations as to minimum course of study, school methods, etc. They are under state inspection and can employ none but regularly certificated teachers. The number of private elementary schools is insignificant, but of the pupils in middle schools one-third are in private institutions.

Teachers in Prussian elementary schools are ordinarily graduates of teachers' seminaries or training colleges. At the end of each year these institutions hold an examination at which the school inspectors and superintendents of the district and a commission from the provincial school board are present. Practical tests in teaching power are required as well as those on theory. The successful candidate gets a privilege to teach for five years. After two years of satis-

factory work and not later than five years after the first appointment a teacher may take a second examination, the passing of which gives him a right to a permanent position and a pension. This examination is largely on educational matters and includes a practical test. Candidates who are not graduates of teachers' seminaries may be admitted to it, and on passing are allowed to teach. The director of the seminary supervises the work of its graduates and can require them to supply defects by additional work. Those who wish to teach in the higher classes of the middle schools must pass an additional examination given by a special commission, and the same body gives a still further examination to those who aspire to rectorships. To gain the right to teach in the secondary schools a candidate, who must have attended a university for at least six semesters, and often possesses a degree, must pass a state examination given by one of the 10 examining boards appointed annually by the Minister. Those who pass may receive, according to the character of their papers, any of three grades of certificates in the various subjects, and these entitle them to teach such subjects in the lower three, the lower six, or all the grades of the Gymnasias. After passing this examination a candidate enters a seminar, of which there are a number attached to secondary schools. Here he is under practical instruction for a year, entering at its successful conclusion on a year of probationary teaching, for which he receives no remuneration. He is then, provided his work is satisfactory, eligible to a permanent appointment.

Elementary teachers receive free rent and fuel, and often a garden. Their annual salaries range from a minimum of 1400 marks to as much as 3800 marks in Berlin, or in the case of rectors even 6000 marks. The average is, however, about 1200 marks and is smaller in the country than in the cities. Salaries usually are regularly graded, according to time of service, up to a maximum. Women are paid somewhat less than men, and they constitute about 17 per cent of the total teaching force in elementary schools. After 10 years of service the teacher can, if disabled or 65 years old, retire on a pension of one-third of his salary. This amount increases by one-sixtieth for each additional year of service up to two-thirds of the salary. Provision is also made for widows and children of teachers. The annual salaries of secondary school teachers range from 2700 to 5100 marks, and in the case of rectors to 7800 marks. In addition they receive an allowance for house rent. The same regulations as to pensions that apply to primary teachers apply also to secondary ones, and in fact to most state officials, an exception being professors in the universities, who, however, are not required to retire.

For the support of schools in Prussia there are five sources of income. The most important of these is the state itself, which pays about one-half of the total required for teachers' salaries. The other sources are school societies, income from inherited property, Church funds, local taxes, and tuition. In the city schools the local taxes supply the larger part of the income; in secondary schools the tuition furnishes nearly one-half the sum required for support. The country schools, however, receive over two-thirds of their income from the state, the amount being a fixed contribution of 100 marks for each head teacher, 200 marks for each additional regular

male teacher, and 150 marks for each female teacher, with 100 marks for each assistant teacher who is in the probation year. The normal schools are supported by the government, as are also the universities and many secondary schools. In the latter tuition is a considerable item. For their organization, see UNIVERSITY.

For the development of the German public educational system, of which the Prussian system is taken as a type, see GERMANY, *Education*.

SWITZERLAND

Each of the 25 cantons of Switzerland has its own separate and independent school organization, and there are very few federal regulations on the subject. The federal constitution of 1874 empowers the Bund to establish and maintain or assist a university or other institution for "higher education." This power has not been used except to continue the support of the federal polytechnic at Zurich and to subsidize various cantonal higher institutions. But by a supplementary article in 1902 it is obliged to subsidize elementary education. In 1910 this subsidy for elementary education amounted to 2,026,500 francs. In the same way the central government has supported vocational education (arts and industries, commerce, agriculture, and domestic and vocational training of women) very liberally, 3,000,000 francs being granted in 1910. The constitution further states that all education, whether public or private, must be under the control of the cantons. They must provide for it and make it compulsory and gratuitous. That they do this well is evident from the fact that in 1898-99 the ratio of attendance to population was greater there than in any other country in the world, while of the recruits in 1899 only 0.23 per cent could not read, a figure reduced in 1910 to 0.1 per cent. All attempts to establish anything like a centralized system have met with determined opposition by those who feared interference with linguistic or religious instruction in the schools. The constitution provides, however, that "it must be possible for the public schools to be attended by the adherents of all beliefs without hurting their freedom of belief or conscience." That not more than 3 per cent of the attendance is in private schools, which are, moreover, patronized almost entirely by children of non-Swiss parentage, attests the satisfactory nature of the religious instruction in the public schools. A few cantons, as Geneva, exclude it entirely from the public system. Three additional federal regulations affect education. The first forbids the labor in factories of children under 14, and limits that of those under 16. The second prescribes an examination for every recruit on entering the army at his twentieth year. The results of this are made known, and it stimulates educational effort, besides bringing into existence improving schools for recruits and increasing the attendance at continuation schools. The final regulation concerns military drill, which by the Acts of 1874, 1877, and 1883 is made a required part of every school programme, to be given to children between 10 and 15 years of age.

At the foundation of the school system of Switzerland we have at present the communal primary schools taking children from 6 to 11 years of age. After this they go either to the cantonal secondary schools proper, or to the advanced elementary schools, the so-called second-

ary schools, the district for one of which embraces several communes, or to the communal continuation schools, usually held in the evening. There are also courses for adults given in the communes. The secondary schools are maintained by the cantons, and include professional and technical schools, with others variously styled middle schools, Gymnasias, or Progymnasias. These are supplemented by cantonal universities and a federal polytechnic. The teachers are licensed by cantonal governments on examination, or in some cantons on a diploma from a normal school. For the higher grades of work an additional examination is required. There were, in 1910-11, 49 normal schools in Switzerland, most of them public institutions maintained by the cantons. In most cantons teachers are elected for life, either by a school board or at a general election. They are also usually pensioned at the end of their term of service. This is, in general, partly provided for by a fund to which they make regular contributions.

At the head of education in each canton there is either (1) an educational council or (2) an education ministry, headed by a director of education, who is a member of the executive council of the canton, or (3) a permanent education council, presided over by a director of education, who is a political officer. The Canton of Bern belongs to the second type, and in the control of its schools it represents the extreme of centralization in Switzerland. The Director of Education controls the inspectors and frames the educational budget. His department determines, on consultation with certain authorities, the curriculum and methods of instruction in all public schools. Private schools must receive his authorization and that of the local school inspectors. The communal council votes the money for its primary schools, and nominates a school board to control the expenditure of this and the details of local school management. Several communes combine to form a secondary school, the control of which is in the hands of a commission, whose members are appointed by the various communal councils and the Director of Education. The middle or higher schools are usually cantonal schools, and are controlled by a commission appointed by the Educational Department. On the other hand, the Canton of Zurich has the least centralized of all the Swiss systems. Its central government is of the third type above mentioned. The Educational Council is composed of six men, four of whom are chosen by the cantonal council and the other two by the whole body of teachers. It controls the organization of education in the canton. The commissions that direct the cantonal schools, i.e., the Gymnasium, middle schools, higher schools, technical institutes, and training colleges, are appointed by the cantonal council on nomination by the Educational Council and Director of Education. For local organization and control of education there are provinces, districts, and communes. Each province has a committee, elected partly by the teachers alone, partly by the rest of the voters. Its function is to visit the schools and supervise their general conduct. There is a district committee elected by the voters to control the secondary school of the district and determine the amount to be raised from local taxation for its support. For the primary school also there is a district organization, including usually several communes, the voters of which have a general assembly to determine

school measures. The communal primary school is controlled by its local board. In Zurich alone of all the Swiss cantons there are no school inspectors. In these two cantons, Zurich and Bern, we have illustrated the extremes between which the systems of the other cantons fall.

In Switzerland, generally, the support of all universities and higher secondary schools is by cantonal funds, aided occasionally by the cities in which such schools may be situated. The district and communal schools are supported by local taxes with cantonal aid. There exist for such support permanent communal funds made up of fees and gifts. Moreover, 12 cantons have a permanent cantonal fund for Volksschule purposes. This does not, however, by any means provide for the support of the schools. Of the total expenditure on primary education it is estimated that the local authorities furnish about two thirds, the rest coming from the cantons. In Geneva, where the French ideas prevail, the canton furnishes 74 per cent of such funds. In general, in the wealthier cantons the canton furnishes more and the commune less of the total raised. The total expenditure on instruction in 1910-11 was 86,400,000 francs (by the cantons 41,800,000 francs and by the communes 44,600,000 francs).

OTHER EUROPEAN SYSTEMS

The systems already described offer examples that are typical of the education in other European states. In Sweden elementary and secondary schools are supported by state subsidies and local taxes. Many schools and universities have in addition to such support the income from endowments. Control of schools is in the hands of local boards, but the central government maintains a system of inspection and requires teachers to be graduates of normal schools. Public elementary education is gratuitous and compulsory between the ages of 7 and 14. In Austria the ideals and methods of Prussian education prevail. The Italian system has the same general features of state subsidies and local and provincial taxes for the support of both elementary and secondary education. The minimum number of schools, the curricula, and the qualifications of teachers are also laid down by the state. Public elementary education is gratuitous and compulsory between the ages of six and nine. The state inspects all public schools, and private schools must receive authorization by the government.

In Spain attempts have been made to establish a complete and efficient system of elementary education. The government determines programmes and inspects schools, but furnishes little assistance to their support. The municipalities bear most of the burden, and the compulsory law is not enforced. For most of the children education is free. In Russia about one-third of the elementary education is carried on by the Church. Nearly all the rest is controlled and supported by the central government acting under the Ministry of Public Instruction. The Church also takes part in secondary education, but here the Ministry bears most of the responsibility. There are a small number of locally supported schools and foundation schools.

UNITED STATES

In the United States the control and support of the education of the people have been left

practically to the several state governments. The central government has, however, dealt with the matter in a few cases. The Ordinance of 1787 provided that one section of each township in the Northwest Territory should be designated as school land and that the proceeds of its sale should go to the support of public schools. After States were organized in this region the funds derived from these lands were turned over to them for educational purposes. Similar grants of land were made to other new States, notably in 1841, in 1849, and in 1860. Up to 1900 about 86,000,000 acres had been devoted to this purpose. These grants were supplemented in 1836 by a gift to the several States of surplus funds in the National Treasury, the sums thus given being by most of them devoted to the support of education. In 1862 the Morrill Act set aside additional lands for the maintenance of colleges in which agricultural and mechanical arts and military tactics were to be taught, and the State universities generally have been the recipients of these gifts. The central government established, in 1867, the Bureau of Education, the main objects of which are the collection of statistics and the preparation of reports.

Each of the several States maintains a system of free public schools, including elementary, secondary or high schools, and, in the case of 39 of them, universities as well. The older States, where great colleges and universities on private foundations have for a long time existed, have not in most cases added such institutions, but have developed, as in Massachusetts, Pennsylvania, and Maryland, systems of annual subsidies to them. For the elementary schools three systems of control exist. The first of these is the district system, according to which the control of each school is left in the hands of a board elected by the people of the district in which it is placed. Under the township system all schools that are located within the region of a township are placed under one board. According to the county system the schools of a whole county are under the control of county boards or school commissions. The district system was developed in New England after the scattering of the population, due to the cessation of the early Indian wars. It spread to the States of the West. Later, owing largely to the opposition of reformers like Horace Mann, who maintained that the district system meant insufficient support and inept supervision for the common schools, New England came to adopt the township system. The county system has been peculiar to the Southern States from the first, and to-day it exists also in some of the States of the Middle West, as in Indiana, Iowa, and Missouri, and in California and Washington of the Western States. The township system exists wholly or partially in 18 States and the district system in 33.

With the development of more elaborate school systems the supervision of the State became a more and more prominent feature. New York, in 1812, created a superintendent of common schools. This example was followed by others, and to-day there are State superintendents in all States. In most of them there is also a State board of education, which usually manages State school funds and either directly or indirectly determines the qualifications of teachers. For more minute supervision there is inspection either by a county superintendent or by the township or district committees. In 35

States the county supervision prevails. In New England the town school committees do the supervising. In addition, at least 1243 cities have superintendents for their public schools. The demand for greater uniformity and effectiveness in the schools as a whole has led not only to the creation of larger units for the control or supervision of schools, but also for the establishment of State funds and the levying of State taxes to supplement local contributions to the cause of education.

In the earlier Colonial period secondary instruction was given in what were called grammar schools. These institutions admitted children who had mastered merely the rudiments of English, and prepared them for college. The high schools were, however, preceded by academies. They were introduced into the United States as a substitute for both the grammar schools and the colleges. Many of these academies received, in addition to private endowments, large grants from the States. Some of them grew into colleges and later into universities. Academies for girls were established, and thus the way was paved for the higher education of women. The academies offered a somewhat wider and more liberal course of study than the older grammar schools and colleges, which were concerned mainly with the classics. In this way they led to the more liberal high schools and to the extension of the college curriculum.

The high school sprang up in response to a demand in the early part of the nineteenth century for the secularization and State control of secondary education. The English Classical School, later called the English High School, was founded in Boston in 1821. To-day a free public high school has to be maintained in every township in Massachusetts, and a number of high schools are State-aided. New York, Maryland, Wisconsin, Minnesota, California, and other States have elaborate State laws governing high schools. In a great number of States their creation and control are left to localities, the actions of which in the matter are not regulated by the State. They are found, however, in all important cities, and are springing up rapidly in nonurban areas.

The free elementary school may be said to exist in every locality of the United States, however sparsely inhabited. In the Western and Southern States the remoter districts are greatly helped by the contributions from the State funds, which are distributed in such a manner as to favor especially the smaller schools. The high schools, on the other hand, the existence of which is left almost universally to local initiative, are dependent largely on local support. Outlying districts are, in consequence, frequently without them, and when they exist there the territory that they supply includes ordinarily a number of elementary school districts. The consolidated high school has been found to be the only solution for such areas. Such divisions are either townships, as in New England, or counties, as in Maryland, the South, and occasionally in the West, or simply a convenient grouping of districts into what is called a union or consolidated high-school district. The board governing such schools is usually a specially created one, except where the township or county system prevails. In these cases, as with the district high school, the elementary and secondary schools are both managed by the same board.

The teachers in elementary schools, up to the time of the establishment of county and State supervision, were selected by the school boards at their discretion. To-day licenses or certificates are universally required before one can be elected to a teacher's position. In New England, however, these are granted by the school committees of the towns, and so teachers are licensed by the same board by which they are elected to office. Elsewhere throughout the Union the certification is in the hands of city or county superintendents or boards of education, or State superintendents or boards of education. Certificates of various grades are issued in the several States. High-school certificates are universally distinct from those for elementary teaching. All are granted either upon examination or upon credentials. Local certificates are valid only in the specific division where they are granted, but are frequently accepted as adequate credentials in other localities. State certificates are for longer periods, or even for life, while the local certificates expire after a few years. See NORMAL SCHOOL.

The ideal course of study in the modern primary school in the United States, as outlined by the Committee of Fifteen in 1894, includes reading, writing, spelling, composition, arithmetic, geography, simple lessons in natural science and general history, vocal music, drawing, with physical culture and manual training. In many schools such a programme exists, and in most an effort is made to approximate it. The greatest difficulty arises in the ungraded country schools, where a single teacher is called upon to teach children from 5 to 18 years of age, representing, of course, all or most of the grades of the elementary school. The ideal grammar school course, as outlined by the same committee, in addition to the subjects of the primary grades, consists of English grammar, algebra, and United States history in the last two years, and either Latin, French, or German in the last year. Only in a few cases, however, are the foreign languages actually to be found in the grammar grades of the elementary school. For rural schools the last few years have seen the development of a great movement to introduce courses of study closely based on the needs of rural life. These are still in process of development. In general, the elementary-school curriculum has been subject to considerable criticism and more especially that part of it which affects the last two grades, the seventh and eighth. The criticism generally takes as its basis the fact that no preparation is given for the life activities which those pupils who leave school forever need, or that no attempt is made to provide some adjustment with the high schools. The first of these criticisms is leading to the development of general prevocational or industrial courses, the second to the reorganization of the high school in some places on a six-year plan beginning with the seventh grade, or the establishment of intermediate schools or junior high schools with three or four year courses beginning at the same period.

The course of study in the high schools is usually arranged with a view to presenting to the pupil from one to four different groups of subjects, any one of which he is at liberty to choose. The first of these groups constitutes the old classical course, but includes, besides Greek and Latin, modern languages or English, or both, algebra, geometry, and some history

and natural science. What is commonly called the literary course drops the Greek and substitutes therefor more English, modern languages, or history. The scientific course drops Greek and sometimes Latin, laying stress on the sciences and mathematics instead. Another course, which emphasizes preparation for business and gives instruction in bookkeeping, stenography, typewriting, commercial arithmetic and law and business methods, is frequently found. The tendency is, however, to hand over such a course to a commercial high school or business college. It is a favorite line of work for evening high schools. Practically all courses embrace algebra, geometry, civics, English, United States history, and physics. The sciences taught in the scientific course include chemistry and often botany and zoology. Courses in solid geometry, higher algebra, and trigonometry are often offered in high schools. No part of the educational system of the United States was more under fire during the period 1905-15 than the high school. The reasons can only be stated very briefly. It was felt that as compared with European secondary schools the achievements of the high school were smaller and the work was begun too late. The curriculum was also criticized as being planned almost entirely with a view to college entrance, with the result that those who did not intend to pursue a college career soon dropped out. Perhaps as a consequence of the first criticism, perhaps in order to make a better adjustment with the elementary grades, the "six and six" plan has been started, i.e., six years of elementary education and six years of secondary. The arrangement of the last six follows various plans, but generally the aim is to increase the variety of opportunity and to meet the needs of different groups of pupils, some of whom will remain only three years, some four, and others six. The following types of courses have been established: the general or cultural course, or college preparatory; the manual-training or industrial courses, leading to technical college or work in shops and trades; household-arts courses, preparing for the home or women's occupations; commercial courses; and agricultural courses. The function of the high school becomes increasingly not merely to train for life occupations, but by greater variety of opportunities to test capacity and develop tastes. The whole movement, however, is still in the experimental stage.

The high school is developing into an independent institution with its own aims and purposes, of which preparation for college is only one of many. The "accrediting" system, which prevails in Michigan and California, and by which high schools desiring to pass students without examination into the colleges are inspected by the faculties of the State universities, has been criticized for tending to reduce the high schools to mere feeders for the universities. On the other hand, it must be said that the colleges have very extensively modified and enlarged the curriculum of the old days of purely classical instruction, so that each of the courses offered in high schools, except perhaps the commercial one, prepares for some line of collegiate work. Moreover, the "accrediting" system has been the only system of effective inspection to which the high schools have been subjected, if we do not regard the college entrance examinations as attaining this end.

No effective system of pensioning teachers exists in the United States, although some laws have been passed aiming at this. They have relied, with few exceptions, on the contributions of teachers, and where they have been established new teachers are required to join in as part of the contract of appointment, the old teachers being given an option. On the other hand, the salaries of teachers in the elementary schools compare favorably with those abroad, averaging, in 1912, \$78.08 a month for men and \$58.08 for women for the country as a whole. The highest average salary for all teachers was \$105.33 in California, the lowest \$35.77 in North Carolina.

Forty-two of the States and the District of Columbia have compulsory-education laws. The common period during which some instruction must be given is from the eighth to the fourteenth year. These laws, though not rigidly enforced, are nevertheless fairly effective, and attendance for at least a good part of the year is now nearly universal for children of school age.

The evolution and present status of higher education in the United States, the most notable features of which have been the development of the State universities and the transformation of the colleges into universities, are dealt with in the article on **UNIVERSITY**. For a treatment of the American elementary schools, see the article on **COMMON SCHOOLS**.

Bibliography. Paul Monroe, *Cyclopedia of Education* (5 vols., New York, 1910-13), contains articles on all phases of education in the United States, for each State, and, in foreign countries, for each country separately, with full bibliographies. United States: Henry Barnard, *American Pedagogy* (Hartford, 1876); F. W. Blackmar, *History of Federal and State Aid to Higher Education in the United States* (Washington, 1890); R. G. Boone, *Education in the United States* (New York, 1890); Gabriel Compayré, *L'Enseignement secondaire aux Etats-Unis* (Paris, 1896); A. E. Winship, *Great American Educators* (Chicago, 1900); E. G. NATIONAL EDUCATION ASSOCIATION. See **EDUCATION ASSOCIATION, NATIONAL**.

NATIONAL FLAGS. National flags or ensigns date from a time long before Constantine adopted the monogram of Christ (See **LABARUM**). They are distinctly an evolution. In early days, as man emerged from the primitive state, the need of some tribal emblem made itself felt, and this was supplied by what afterward became the standard. Later on the religious element entered into the composition of flags and banners and coats of arms. See **NATIONAL ARMS**.

United States. The national flag of the United States of America is dealt with in a separate article under the title **flag** (q.v.). This is commonly called the "Stars and Stripes." The President's flag is blue, in the centre of which appears a representation of the arms of the United States in their proper colors. See **NATIONAL ARMS** and also **HERALDRY**.

The flag of the Vice President is white, and in the centre appear the arms of the United States, the colors being those of the coat of arms, with

slight modifications or minor changes in color necessitated by the white ground on which the coat of arms appears.

EUROPE

Austria-Hungary. The royal and Imperial standard of Austria-Hungary is a golden flag upon which appears a black two-headed eagle displayed, each head royally crowned, and above all the crown of Austria. The flag of the Austrian navy has three equal horizontal stripes—red on top, white in the middle, and red below. The centre of the flag bears the arms of Austria, the shield having a border of gold and surmounted with the crown of Austria. The flag of the merchant marine is like that of the navy except that the lowest band is red in the half next the flagstaff and green in the other, the reason being that the colors of Austria are red, white, and red, and those of Hungary red, white, and green. The merchant flag bears two crowned shields, the one next the staff is for Austria and the other for Hungary. The Hungarian crown is that of St Stephen and is different from the crown of Austria.

Belgium. The naval and merchant-marine flags of Belgium are alike. The flag is composed of equal vertical stripes, black (next the staff), yellow, and red. The royal standard contains the royal coat of arms of the Kingdom, borne on the central yellow stripe.

Bulgaria. The national ensign or naval flag is a tricolor of horizontal bands—top white, centre green, and red at the bottom. In a space next to the flagstaff is the golden crowned lion rampant on a red ground. The merchant ships use the plain tricolor without the lion.

Denmark. The flag of Denmark is now the oldest unaltered one in the world. The royal arms have as their most striking feature the Dannebrog, or silver cross of Denmark, bordered with red. This cross divides the shield into four quarters, each of which is occupied by a separate device. The origin of the cross is said to date from 1219, when King Waldemar, at a critical moment in his career, averred that he had seen this cross in the heavens. The Dannebrog therefore became for him, as the name implies, the "Strength of Denmark." The flag of the navy is red, swallow-tailed, and has the white Dannebrog upon it. The flag of the merchant marine is a red flag with a white cross upon it and is not swallow-tailed.

France. The tricolor of France has been in official existence only since 1789, the year of the Revolution. Previous to that (and now called France Ancient) was a blue cloth powdered with golden fleurs-de-lis. In the reign of Charles V (1365) the number was reduced to three, typifying the Trinity (now called France Modern). When Henry III (1574) came to the throne, he adopted the *drapeau blanc* as the royal flag.

The tricolor, made up of three equal vertical bands of color—blue next the flagstaff, white in the centre, and red in the fly—now forms the national flag (called France Present). The flag is used by the navy and the merchant marine, as well as on shore by citizens generally. The President's flag carries his initials. When the civic guard was raised on July 14, 1789, it was decided that the colors should be blue and red, the colors of the city of Paris, to which, on the proposal of Lafayette, the white color of the

royal Bourbon flag was added. The French tricolor of to-day is, as it were, a compromise flag, in which the colors of Paris are united with the former sovereign's color—white.

Germany. On the Imperial standard of Germany is laid the Iron Cross, black with a white and black border, at the centre of the cross is the German eagle, bearing on its breast the shield of Prussia, and this latter carries a quartered shield with the arms of the Hohenzollerns. The flag of the Imperial navy is white and divided into quarters by the arms of a large black cross having at its centre a circle in black outline containing the black Prussian eagle crowned. The upper quarter next the hoist contains the merchant flag in miniature, upon the centre of which is superimposed the Iron Cross. The merchant flag consists of three horizontal stripes equal in width, the upper being black, the middle white, and the lower red. These colors are derived from the black and white of Prussia and red and white, the colors of the Hanseatic League (q.v.).

Great Britain. The flag of the people in the British Empire is the Union Jack. It symbolizes the parliamentary union of the three constituent parts of the United Kingdom of Great Britain and Ireland. The Union Jack, or union flag, is composed of three crosses—St. George's, the broad upright Latin cross, red upon a white ground; St. Andrew's, saltire or X-shaped cross, white upon a blue ground, and the cross of St. Patrick, a red saltire on a white ground. The arrangement of the arm of the crosses next to the flagstaff is different from those remote from the staff. When James I of England and VI of Scotland united the crowns of those countries each had its own flag, and ships of each country continued to carry each its own colors. When the English and Scottish ships met at sea frequent contentions resulted as one or other hoisted its jack above that of the other. To put an end to these disagreements a flag combining the jacks was devised, and in 1606 a union flag was brought out. It is constructed by laying down the Scottish emblem and placing the English jack on top of it. The Scottish flag is blue, and where the red cross of St. George would touch the blue ground a narrow white border was interposed. The boundary between red and blue is never clear when viewed at a distance, and it is at variance with a rule of heraldry. In the reign of Anne the parliaments of England and Scotland were united, and the union flag was duly sanctioned, so that the flag of 1707 indicated the parliamentary union of the countries. In the jack of Anne the red St. George's cross had a wider border than the "additional jack of James" had, and thus indicated a portion of the original white ground of the English jack. In the year 1801, appeared the union flag as it is now flown. The Irish jack, a red saltire, or St. Patrick's cross, on a white ground, had to be incorporated to indicate the parliamentary union of Great Britain and Ireland.

In order properly to construct the Union Jack imagine a table twice as long as it is wide. The table, if entirely covered by a blue tablecloth, makes the ground for the jack. On this two diagonal lines are laid, and these lines intersect at the centre. Bands of white material are laid on the upper side of each of these diagonals at the left end of the table. At the point of intersection of the diagonals the white

bands are cut and placed under the continuation of the same diagonals, the white bands going below the lines which lie on the right-hand end. The red Irish saltire, of the same width as that of the white St. Andrew's cross, is placed in the only space available, on the underside of both diagonals at the flagstaff end and above the diagonals at the right-hand end. As the two quarters next the flagstaff are more important from an heraldic point of view, here the St. Andrew's is above the St. Patrick's cross, thus indicating that Scotland came into the Union before Ireland. In order to avoid the touching of red and blue it is necessary to edge the red Irish saltire with white. The Irish cross is as wide as St. Andrew's, but the white border of the red saltire has to be cut off its own edge, although the red saltire with its border is equal to the full St. Andrew's cross of white. The red cross of St. George is then added. Thus, with its broad white border, is laid over the two saltires of Scotland and Ireland. The Union Jack is the proper flag for any British subject to use for private or public display. It typifies parliamentary union and is thus in every respect the people's flag.

The Union Jack is used by citizens all over the British Empire. When hoisted for the Governor-General of Canada, a white circular space at the intersection of the arms of the crosses is reserved for the badge. This circle is usually inclosed by a wreath of laurel leaves, when used by a colony, but in the case of Canada the wreath is of maple leaves, and ferns for New Zealand.

In Canada the badge consists of a quartered shield in which appear the arms 1, Ontario. 2, Quebec. 3, Nova Scotia. 4, New Brunswick. This is surmounted by the crown. The lieutenant governors, when using the Union Jack officially, place inside the wreath the arms of their particular province, but without the crown.

There is no distinctive flag for Canada, as the ensigns of the British Empire do not designate territory, they indicate class of service. The Union Jack is used by the people of Canada as in other portions of the British Empire. It is varied only by the Governor-General of the Dominion and by the lieutenant governors of the nine provinces of Canada. The Mercantile-Marine flag flown by vessels of Canadian register is the Red Ensign of the Empire, with the badge of Canada (without crown or wreath) in the fly of the flag.

The British ensigns are three in number—the white, the blue, and the red. Each carries the jack in the upper left-hand corner next the staff. The white ensign is the flag of the royal navy. It bears the red cross of St. George in addition to that in the jack. The blue ensign is for all vessels in government employ. When employed by a colonial government the badge of the colony is in the fly. The blue ensign is also the flag of the Royal Naval Reserve. The red ensign is the flag of the merchant service.

For about 200 years the British navy was divided into three squadrons, called respectively the Red Squadron, the White Squadron, and the Blue Squadron. At the time of his death Nelson was vice admiral of the White, as shown on a monument in the Guildhall in London. As the various ensigns of these divisions of the royal navy were more or less difficult to distinguish in action, Nelson ordered the whole fleet to hoist the white ensign at Trafalgar on Oct. 21, 1805. These three divisions were abolished by order

in council on July 9, 1864. A song written in America by an Englishman has been applied to Great Britain. Thus the song, "The Red, White, and Blue," perpetuates the memory of these three squadrons. It evidently does not refer only to the colors of a flag. The British ranking order is preserved. In the United States the reverse order prevails. It is thus probably commemorative of the disappearance as such of the red, the white, and the blue squadrons.

Greece. The flag of Greece is simple. The royal standard is a silver (white) cross on a blue ground. The royal shield is ensigned with the crown and placed at the intersection of the arms of the cross. Behind the shield are two sceptres. The flag of the navy contains a canton of blue upon which the white Greek cross stands on blue, and in the fly are nine horizontal bars, four white and five blue, the royal crown being shown in the intersection of the arms of the cross. The merchant flag is similar, but without the crown. The colors of the flag, white and blue, were derived from the arms of Otto of Bavaria, who was called to the throne of Greece in 1833. The motto of Greece, ΑΓΑΠΗ·ΑΑΟΤ·ΙΕΧΤΕ·ΜΟΤ, referring to the new King's choice by the people, reads, "My strength is my people's love."

Holland (The Netherlands). The national flag is a tricolor made up of three equal horizontal bands—red at the top, white centre, and blue below. The navy and mercantile flags are alike. Why the top stripe is red and not orange is not exactly known, though the original upper color was orange after William the Silent, Prince of Orange, had thrown off the Spanish yoke. In 1599 the flag was undoubtedly orange, white, and blue. Fournier, in 1643, wrote of it as red, white, and blue, and under these latter colors the victories of Van Tromp and De Renter were gained.

Italy. The Italian flag dates back to 1310, when Amadeus V, Duke of Savoy, assisted the Knights of St. John of Jerusalem to victory over the Saracens at the siege of Rhodes. After the battle the Grand Master, in gratitude, presented Amadeus with the silver cross of the order. Amadeus placed it on a red shield with blue border in the arms of Savoy. In 1805 Napoleon made the northern provinces into a kingdom and gave it a tricolor, like that of France, but with the vertical colors green (next the flagstaff), white, and red. When Napoleon was overthrown this flag disappeared. It was revived in 1861 when Victor Emmanuel, King of Sardinia and a scion of the house of Savoy, became King of the southern portion of Italy. In 1870 the northern and southern parts were united as one Kingdom. The Savoy arms on the central white vertical band of Napoleon's tricolor became the flag of united Italy. The shield is crowned when used by the navy, but is plain for the merchant marine.

Monaco. Monaco has a white flag for the Prince, on which is a crowned shield, the field of which is covered with lozenge-shaped figures, red and silver. The collar of the Order of St. Charles, instituted in 1863, surrounds the shield, and the pendant is a Maltese cross. The naval flag is a plain red and white flag, two bands being horizontal, red on top. The merchant flag is the same.

Montenegro. Montenegro has a red flag with a white border, and in the centre are the royal arms crowned, being a double-headed eagle dis-

played, with sceptre and orb. The naval flag is a tricolor—from above red, blue, and white horizontal stripes. On the blue is a crown above the letters *H I*. The merchant-marine flag is a tricolor with broad horizontal bands, like the ensign, but the crown and initials are not shown.

Norway. It was in 1397 that Sweden, Norway, and Denmark formed one kingdom under the sway of Denmark, but in 1414 Denmark released its hold. The naval ensign is a red flag, swallow-tailed, with a broad blue cross upon it. The cross has a narrow white border, and the fly end of the blue cross projects from the central angle of the swallowtail, as if a pennant had been laid on the flag. Norway achieved its independence in 1814. The merchant flag is red, with a blue cross edged with white. This flag is not swallow-tailed.

Portugal. In 1910 Portugal became a republic, though some memory of its history is retained in the flag. The arms of Portugal are a large silver shield on a green and red ground. On the shield are five small blue shields in the form of a cross, and each shield bears five plates of silver. The large shield has a red border, on which are seven golden castles. This device dates from 1139, when the country, which had been in subjection to the Moors for 500 years, threw off the yoke. Alphonso I defeated five Moorish princes in the battle of Ourique and adopted five small shields to commemorate the victory. The five white spots represent the five wounds of Christ, in whose strength Alphonso believed he had defeated the infidels. The red border was added by Alphonso III in 1252 after his marriage to a daughter of the King of Castile. In the flag this shield is placed upon an armillary circle of gold. The colors of Portugal are green and red, and the national emblem shows the flag divided vertically and equally. It is square, with green next the flagstaff, red is the color for the Republic. John I of Portugal was the father of Prince Henry the Navigator (1415-99). Prince Henry achieved knighthood, and the green is that of the cross and ribbon of the Knights of St. Benedict of Aviz and, with the armillary circle, commemorates Prince Henry's fame. The national ensign is a green and red flag. The proportion of green to red is as 2 to 3. The shield is placed in the centre of the dividing line. The merchant flag is entirely green, with the shield and armillary circle in the centre.

Rumania. Rumania has a tricolor with vertical bands—blue next the flagstaff, yellow centre, and red in the fly. The yellow band contains the arms within a crowned canopy of ermine, which is the quartered shield of the state with supporters. The motto *Nihil sine Deo* (Nothing without God) is below the shield on a black ribbon. The naval ensign contains these arms, while the merchant flag is plain.

Russia. The introduction of the two-headed eagle for Russia dates from 1472, when Ivan the Great married Sophia, a daughter of Constantine Palæologus, and assumed the arms of the Greek Empire. The naval flag is white with a blue St. Andrew's cross upon it. The jack of the navy is made by placing the narrow white cross of St. George on a red ground, and over all the white-bordered blue cross of St. Andrew. This flag resembles the "additional jack of James," except that the colors are different from those of the British jack. The merchant

flag is a tricolor of three equal horizontal bands—white on top, blue in the middle, and red below. These colors were originally red, white, and blue. Peter the Great derived them from the Dutch, from whom he learned shipbuilding. This form was the Dutch flag reversed, which is the signal of distress for Holland, and was later altered.

Servia. The merchant flag of Servia is a tricolor of broad horizontal stripes—red above, blue centre, and white below. The royal standard has a crowned canopy of ermine containing a crowned shield and supporters. The shield shows a double-headed eagle displayed, upon whose breast is a red shield containing an upright cross with the date 1804. Each quarter made by the arms of the cross contains a Slav initial letter. The standard has an indented border, the colors are white, red, and blue. The merchant flag is usually a plain tricolor, but sometimes it has the arms inserted.

Spain. The flag of the navy is yellow, the color of Aragon, having on the upper and lower edges a wide stripe of red, the color of Castile. On the broad yellow stripe an oval shield crowned is shown near the flagstaff, on which are the arms of Castile impaling Leon. The merchant-marine flag is a yellow flag upon which two red stripes are laid some distance in from the edge so that the flag is composed of five horizontal stripes—yellow, red, yellow (broad, central), red, and yellow. The crown and shield of Castile and Leon do not appear on this flag.
